To Head Gardeners.

FOREMAN, in the Houses; age 25.—Mr. GEO. MOUNT, The Rose Nurseries, Canterbury, can with confidence recommend a young man as above. Has a good knowledge of his profession, and is thoroughly trustworthy.

FOREMAN, or SECOND, in a Gentleman's establishment.—Age 24; an energetic steady man. Can be highly recommended.—J. G., 3a, Upcerne Road, Chelsea, S.W.

FOREMAN, in the Houses.—Age 25; ten years' experience in the Cultivation of Stove and Greenhouse Plants, Vines, Peaches, Melons. Good references.—C. LINK, Everingham, Yorks.

FOREMAN; age 25.—W. SUTTON, Gardener, Ashley Park, Walton-on-Thames, can highly recommend his Foreman, E. L. Jones, who has been with him two years, to any Gardener requiring the services of a steady, willing, and obliging young man.

ORCHID GROWER and GARDENER (WORKING).—J. EARL will be pleased to recommend a man as above. Good experience and excellent character.—Nellestone, Ryde, Isle of Wight.

GROWER, or under a Foreman.—Age 24; ten years' experience. Fruit, Ferns, and general Market Stuff.—G., 24, Turner Road, Lee, S.E.

GROWER of Stove and Greenhouse Plants, in Nursery.—Age 23; good character and experience.—A., Boston Grove, Boston Spa, Yorkshire.

PROPAGATOR and GROWER in a Market Nursery.—Age 23; state wages, &c.—W. BARNES, Little Po-brooke, Litchfield, Hants.

PROPAGATOR.—Nearly five years' experience in Rhododendrons, Conifers, Clematis, Roses, and Soft-wooded Plants.—Apply, with terms, to BRIGGS, Messrs. Cripps & Sons Nurseries, Tunbridge Wells.

PROPAGATOR, of Soft and Hard-wooded Plants, Ferns, &c.—Age 26; wanted a permanent situation. Thoroughly experienced. Large establishment preferred.—L. M., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

JOURNEYMAN (FIRST), in the Houses; age 22.—Mr. GEO. HUMPHREY, Nash Court, Faversham, can highly recommend a steady, respectable, trustworthy young man as above.

JOURNEYMAN (FIRST).—Age 23; eight years' experience Inside and Out. Twelve months' good reference in present situation, principally in Fruit Houses. Three years previous in Orchids, Stove, and Greenhouse Plants.—W. T., The Bothy, Jackwood, Shooter's Hill, Kent.

JOURNEYMAN (FIRST), in the Houses, in a good establishment.—Age 22; two and half years in present place. Good character.—W. HAMMOND, Bearwood Gardens, Wokingham, Berks.

JOURNEYMAN (FIRST).—Age 22; has a good knowledge of Fruit, Orchids, and Stove and Greenhouse Plants. Good references.—G. CHILCOTT, Elington Gardens, Puddletown, Dorchester.

JOURNEYMAN, in the Houses.—Age 20; two and a half years in last situation, good references.—F. FORTESCUE, Prospect Place, Caversham, Reading.

JOURNEYMAN, in the Houses.—Age 22; seven years' experience. Good references.—W. JONES, The Street Gardens, Chorley, Lancashire.

JOURNEYMAN, in the Houses.—Age 21; six years' good character from present situation.—O. WATTS, The Gardens, Aynho Park, Banbury.

JOURNEYMAN, Inside, in a good establishment.—Age 20; three years' good character from present employer. Bothy preferred.—J. MYERS, The Gardens, Hawswick, St. Albans, Herts.

JOURNEYMAN, in a good establishment.—Age 20; four and a half years with present employer; good character.—Mr. HENDERSON, Mabledon Park Gardens, Tonbridge, Kent.

JOURNEYMAN, in the Houses, in a good establishment.—Age 24; first-class reference as to character and ability from last situation.—W. QUARRY, Glenthorne, Stanmore, Middlesex.

JOURNEYMAN; age 19.—Mr. WHITEMAN, Gardener, Ewell Castle, Surrey, wishes to recommend a young man as Journeyman. Good experience Inside and Out.—W. HUNT, North Acres, Streut, Sussex.

JOURNEYMAN, in the Houses.—Age 21; six years' experience in Fruit and Plant-houses and Outside. Excellent character from last and previous employer.—A. MILLARD, Myrtle Cottage, Groombridge, near Tunbridge Wells.

JOURNEYMAN, in the Houses.—Age 20; six years' experience, last two years in Orchids. Well recommended.—M. DYER, Gatton Lodge, North Cray, Kent, would be pleased to hear of a situation as above. Bothy preferred.

JOURNEYMAN.—Age 21; Inside preferred, six years' experience, can be recommended by WM. ELLIS, The Gardens, Pepper Arden, Northallerton, Yorkshire.

JOURNEYMAN (FIRST in the Houses).—Age 23; nine years' experience. Good testimonials from present and previous employers. Country preferred.—J. B., 8, Cochrane Street, St. John's Wood, N.W.

JOURNEYMAN, in the Houses.—Age 21; seven years' experience in good establishments. Excellent character from last and previous employer.—EDWARD BEAN, Lawa Cottage, Mount Street, Diss, Norfolk.

JOURNEYMAN, in the Houses.—Age 21; five years' experience, Inside and Out. Good character.—R. COOPER, The Gardens, Temple, near Great Marlow Bucks.

JOURNEYMAN, in the Houses.—Age 23; three years in present place. Good character.—D. J. H., The Gardens, Bentley Priory, Great Stanmore, Middlesex.

JOURNEYMAN, in the Houses or otherwise.—Age 22; six years' experience. Four years' good character from present situation.—GARDENER, Moreton House, Bideford, Devon.

JOURNEYMAN, in the Houses, or Inside and Out.—Age 27; ten years' good character. Leaving through break-up of establishment.—R. S., Carshalton House, Carshalton, Surrey.

JOURNEYMAN, in the Houses or otherwise.—Five years' excellent character from present situation. Satisfactory cause for leaving. Abstainer.—T. HOOKER, 24, Crampton Road, Pease, S.E.

JOURNEYMAN; age 23.—W. SUTTON, Gardener, Ashley Park, Walton-on-Thames, will be pleased to recommend a young man, as above, to any Gardener requiring a steady, willing, and obliging young man.

JOURNEYMAN, in the Houses.—Age 20; three years in present situation. Bothy preferred.—For particulars, apply to Mr. CAKEBREAD, Rayner's Glenn, Bucks.

IMPROVER, in the Houses, or otherwise.—Age 21; can be well recommended from last employer.—WM. ABBOTT, Tanfield, Bedale, Yorkshire.

IMPROVER, in a Gentleman's establishment.—Age 18; two years' good character from present situation.—Please apply, to KEMBLE, Ewell Castle, Ewell, Surrey.

IMPROVER, in a Gentleman's Garden.—Age 18; good reference.—P. W., 51A, Upper Berkeley Street, Portman Square, W.

IMPROVER in Gentleman's Garden, or Market Nursery.—Age 18; well educated. Used to Palms and Ferns.—B., 57, Lyndhurst Grove, Peckham, S.E.

IMPROVER; Houses preferred.—W. WAINWRIGHT, Kimberley Park, Wymondham, Norfolk, can highly recommend a young man as above. Five years in present situation.—Apply, ERNEST ALLEN, Kimberley Gardens, Wymondham, Norfolk.

TO MARKET GARDENERS, &c.—Wanted, re-engagement in Market Nursery.—Age 22; well up in Plant Growing and Making-up Cut Flowers. Can Serve Customers.—G. D., 3, Rose Terrace, Stourbridge Road, Halesowen.

TO NURSERYMEN.—Situation wanted to Grow Plants for Market, under a Foreman. Age 21. Good references.—T. R., 57, Lenham Road, Lee, S.E.

TO GARDENERS.—A young man seeks a situation (age 19). Five years' experience. Good character. Bothy preferred. Abstainer.—J. DAVIES, The Gardens, Cruckton Hall, Shrewsbury.

TO GENTLEMEN'S GARDENERS ONLY.—Wanted, by a Gardener's Son, a situation under a good Gardener, Indoors and Out. Age 20; strong, active, and willing; four years in present situation. Premium given.—G., Mr. Goddard, 43, Newland Road, Worthing, Sussex.

TO NURSERYMEN, &c.—Wanted, by a young man (age 24), situation in a London or Provincial Nursery. Had eleven years' experience in the Houses. Good Propagator. Grower of Plants for Market. Eighteen months' good character.—W. W., Staines Villa, Staines Road, Sunbury, Middlesex.

TO FLORISTS and OTHERS.—Wanted, a situation by a young man (age 23); nine years' experience. Four years in present situation. Amongst Eucharis, Roses, Bouvardias, &c. for Cut Blooms. Highest references.—Please address, LILLUM, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO FLORISTS and OTHERS.—Wanted, a situation, by a youth (age 17); two years' experience; quick at Potting, Watering, &c. Highly recommended.—W. GORMAN, Glysionen, St. Clears, Carmarthenshire.

NURSERY CLERK.—Well experienced in Nursery and Seed Business, good general Correspondent, Cashier, or Book-keeper. Capable of taking entire Charge of a Business when Principal away.—Z. A., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

Seed Trade

SHOPMAN, CLERK, or TRAVELLER.—Eighteen years' experience; thorough knowledge of Garden and Agricultural Departments. Excellent references.—W., Postmaster, Stewarton, Ayrshire.

CLERK, in the NURSERY and SEED TRADE.—Good Correspondent and Book-keeper; would assist in Seed Shop, if required.—T. K., Mr. Hamlin, Florist, &c., Bletchley, &c.

HOLLOWAY'S PILLS.—Wrong made Right.—Every day that any bodily suffering is permitted to continue renders it more certain to become chronic or dangerous. Holloway's purifying, cooling, and strengthening Pills are well adapted for any irregularity of the human body, and should be taken when the stomach is disordered, the liver deranged, the kidneys inactive, the bowels torpid, or the brain muddled. With this medicine every invalid can cure himself, and those who are weak and infirm through imperfect digestion may make themselves strong and stout by Holloway's excellent Pills. A few doses of them usually mitigate the most painful symptoms caused by undigested food, from which they thoroughly free the alimentary canal and completely restore its natural power and action.

THE BEST PEA IN THE WORLD: WEBBS' WORDSLEY WONDER.

A Blue Wrinkled Marrow, growing 2½ feet high, of strong and vigorous habit, and is the earliest Pea of the kind in cultivation, as it comes into use but a few days after Sangster's No. 1 and Kentish Invicta. The pods—produced in pairs at every joint—are of medium size, slightly curved, and each pod is literally packed with from ten to twelve large Peas, which are exceedingly sweet, of beautiful colour, and the finest flavour—3s. PER QUART, Post-free.

From "The Garden," August 23.
"WORDSLEY WONDER PEA.—This Pea merits all that can be said in its favour.—J. MITR."

From Mr. A. PETTIGREW, Gardener to the Most Noble the Marquis of Bute.—"I have grown your New Pea, 'Wordsley Wonder,' and I consider it a most excellent variety; it is a great bearer, podding close to the ground. It fills its pods well, and the flavour is all that could be desired."

From WM. HY. MONTON, Esq., Shepton Mallet.—"Your seeds have given me every satisfaction, more especially 'Wordsley Wonder' Pea. I have had in many cases pods with thirteen Peas in a pod and (in one instance only) the, to me, unparalleled number of fourteen in a pod. It does not come in quite so early as some others, but I am content to wait a day or two, and contentment in this case brings great gain."

From Mr. O. OWENS, Gardener to the Most Noble the Marquis of Anglesey:—

"Your New Pea, the 'Wordsley Wonder' is of extra good quality, with large and well-filled pods, and a most abundant bearer. I have recommended it to all my friends, as I think no one should be without such a Pea."

From Mr. R. SQUIBBS, Gardener to the Most Noble the Marquis of Bristol:—

"I found the 'Wordsley Wonder' Pea a very excellent variety of robust habit, with fairly long well-filled pods, produced in abundance, and I think perhaps the best Pea I ever tasted for quality and flavour."

WEBBS' CHANCELLOR PEA.

This New Blue Wrinkled Marrow Pea is one of the finest main crop varieties in existence. It is a continuous bearer, of robust habit of growth, and commences podding close to the ground.—2s. 6d. PER QUART, Post-free.

WEBBS' VEGETABLE SPECIALTIES

The following varieties should be grown by all who wish to excell in the production of Vegetables either for Exhibition or Profit:—

WEBBS' EMPEROR CABBAGE

Lord DERRY'S Gardener says:—"Webbs' Emperor was grown with four other sorts, and was considered the best of the lot." 6d. and 1s. per Packet, post-free.

WEBBS' MAMMOTH RED CELERY

Mr. J. OWEN says:—"I gained 1st and 2nd Prizes with your Mammoth Red Celery at our show." 6d. and 1s. per Packet, post-free.

WEBBS' CRITERION LETTUCE.

Mr. J. MITR says:—"Your Criterion Lettuce is a beauty—the best of all." 1s. per Packet, post-free.

WEBBS' JUBILEE TOMATO.

The Right Hon. J. CHAMBERLAIN'S Gardener says:—"It is one of the best I ever grew. I shall grow it again." 1s. 6d. and 2s. 6d. per Packet, post-free.

WEBBS' QUEEN VICTORIA MELON

Mr. J. WILKES says:—"It sets its fruit very freely, which are very handsome averaging 5 lb. in weight." 2s. 6d. per Packet, post-free.

WEBBS' MATCHLESS B. SPROUTS.

Mr. W. IGGULDEN says:—"Webbs' Matchless proves to be of great merit, producing an abundance of sprouts." 6d. and 1s. per Packet, post-free.

WEBBS' BANBURY ONION.

Mr. J. MITR says:—"Webbs' Banbury is the best for the main crop, and none can equal it for exhibition." 6d. per Packet, 1s. per Ounce, post-free.

WEBBS' CLIMAX TURNIP.

H. T. HICKMAN, Esq., says:—"It turned out a most productive crop." 1s. 6d. per Ounce, post-free.

WEBBS' MAY QUEEN BROCCOLI.

Mr. F. ROBERTS (Prestwood Gardens) says:—"I consider it the best winter variety yet introduced." 1s. 6d. per Packet, post-free.

Beautifully Illustrated, post-free, 1s., which will be allowed off subsequent orders.

COVENT GARDEN CLUB.

The ADJOURNED MEETING for the PROMOTION of this CLUB was held at the "Covent Garden Hotel" on MONDAY EVENING last, and numerously attended by Salesmen of the Market and others. The Secretary, Mr. W. ARTHUR BOARD, explained the objects of the proposed Club, which has been a long-felt want in the neighbourhood, particularly amongst the Salesmen in the Market. An animated discussion followed, the Meeting being unanimously in favour of the Club; and ultimately a Committee of three Gentlemen were deputed to make arrangements for the acquisition of suitable Premises and Accommodation, and the Meeting was adjourned until THURSDAY NEXT, the 1st of March, at 8 P.M. The success of the concern is confidently predicted. Salesmen in the Market and Residents in the neighbourhood are cordially invited.

W. ARTHUR BOARD, Hon. Secretary.

To the Trade. **Home-grown VEGETABLE and FIELD SEEDS.** H. and F. SHARPE are now prepared to make special offers of their fine selected stocks of VEGETABLE and FIELD SEEDS, all of which they have harvested in splendid condition. The prices will be found very advantageous to purchasers. Seed Growing Establishment, Wisbech.

Full of Useful Information—No Charge. **BARR'S ISSS SEED CATALOGUE**, now ready. In addition to the usual valuable information, will be found special remarks on the Culture of the TOMATO and TOBACCO AS INDUSTRIES, with a Special List of HIGH-CLASS POTATOS, handsome in form, pleasant in flavour, and beautiful croppers. CATALOGUE free on application to BARR AND SON, King Street, Covent Garden, W.C.

- 100 CONIFERS, in 50 distinct varieties for 50s.
 - 100 ORNAMENTAL TREES, in 50 distinct varieties, including many variegated golden and purple Acers, &c. for 50s.
 - 100 DECIDUOUS SHRUBS, in 50 distinct varieties for 20s.
 - 100 EVERGREEN SHRUBS, in 50 distinct varieties for 30s.
 - 100 ROSES, in 50 finest varieties, of H.P. and Tea on the Seedling Brier, from the open field for 35s.
- We may state that we have grown Teas on the Seedling Brier in the open field for many years back, proving that they are about as hardy as the H. P., as we have frequently had the latter cut back to the snow line. It is only when the thermometer registers below zero that they require protection.
- 100 HERBACEOUS PLANTS, in 50 fine varieties for 20s.
 - 100 PRIMULAS, in 50 distinct varieties for 50s.

RAWSON'S "SURPRISE" BROCCOLI.—A late Broccoli, coming in in May. Stood the last severe winter in the Lake district unprotected. The foliage is beautifully variegated, and a row of plants looks unique. See *Garden*, vol. xxxi., p. 518. A limited quantity of seed, from selected plants for disposal at 2s. 6d. per packet. Postal Order to
Mr. J. GARNET, Seedsmen, Bowness, Windermere.

A Good Potato, of Sterling Worth
MAIN CROP KIDNEY,
W. W. JOHNSON AND SON,
 First-class Certificate awarded by the Committee of the Royal Horticultural Society, September 21, 1887.
 It was tested by cooking, and described by the Committee as a "White Kidney, with clean, rough skin, white flesh, a good cropper."
 This Potato is pronounced by competent judges as likely to become one of the best Main Crop Potatoes of the future. It has entirely resisted disease; tubers have a handsome appearance, with very shallow eyes; are white, mealy, and of the finest flavour when cooked. In excellent condition for the table from the time of taking up until late in the spring.
 Price per peck of 14 lb., 5s.; per bushel, 18s.
 Wholesale of Messrs. **HURST AND SON**, 152, Holmditch, London, E.; and from **W. W. JOHNSON AND SON**, Seed Potato Growers and Seed Merchants, Boston, Lincolnshire.

NOTICE OF REMOVAL.
 HORTICULTURAL SUNDRIES.

MISS J. SLAYMAKER, daughter of the late Mrs. Slaymaker, who for 43 years was Tenant of a Shop in the CENTRE AVENUE, COVENT GARDEN, begs to inform her Customers that she has

REMOVED HER BUSINESS OF FLORIST AND HORTICULTURAL SUNDRIES FROM COVENT GARDEN to 25, CATHERINE STREET, W.C.

(directly opposite the main entrance of Drury Lane Theatre), where the Business will be conducted on the same lines and with the same attention to the wishes of Customers and the Public as hitherto. **THE SHOWROOMS** at the New Premises will be stocked with all the Latest Designs in **BOUQUETS, WREATHS, CROSSES, BASKETS, &c.**, also all **HORTICULTURAL and FLORIST REQUISITES**. The favour of an early visit of inspection is respectfully solicited. The New Premises are situated less than one minute's walk from the Flower Market and Central Avenue, Covent Garden Market, where Messrs. **SLAYMAKER & Co.** for nearly half a century have enjoyed the support which, with the increased facilities now at their command, they trust still to receive.

I have very much pleasure in announcing that my New Catalogues of the above and other plants are now ready, are being issued to my regular customers, and may be had post-free upon application.

HARDY PERENNIALS.

The present season's edition of this Catalogue has been prepared with an unusual amount of care, and contains almost every known Hardy Perennial of really sterling worth, either as a plant adapted specially for cutting, or as a decorative subject in pots, in the borders, or in beds, and must certainly be admitted to be the most complete Catalogue of Perennials ever published. It is embellished with a number of thoroughly well executed engravings representing many of the specially meritorious and new plants: several of the engravings have been expressly prepared for the work in question. It also contains very complete collections of

HARDY ORCHIDS, AQUATICS, AND BOG PLANTS, GAILLARDIAS, SUNFLOWERS, POPPIES, IRIS, LILIES.

BAMBOOS, ETC.,

PÆONIES—TREE AND HERBACEOUS.

These are offered in a separate Catalogue, and go to constitute one of the most complete Collections of these really interesting and practically indispensable flowering plants ever offered. I was awarded, last season, several FIRST-CLASS CERTIFICATES for new varieties.

HARDY FLORISTS' FLOWERS.

This Catalogue is one of the most complete and correct of its kind containing every variety of real merit, including Carnations, Picotees, Delphiniums, Pansies, Pyrethrums, Phloxes, Pentstemons, and several other families. Twelve pages of Novelties belonging to the families enumerated are also included. The Catalogue is thoroughly complete, well illustrated, and contains abundant cultural notes.

CHRYSANTHEMUMS.

My collection of this family is one of the most complete in Europe. Every variety which is really worthy of cultivation is included. Many varieties are offered in some catalogues which are really valueless: they will not be found in the Catalogue referred to. It extends to twenty pages of really first-class sorts, all fully and correctly described, and is accompanied by a well executed litho of a new, late-flowering, golden-yellow variety, named

GOVERNOR OF GUERNSEY,

which I have much pleasure in offering this season for the first time, and which I am sure is destined to become the most popular of late-flowering varieties for cutting or for decoration.

HARDY CLIMBERS

are grown at Tottenham upon a most extensive scale. My sales of this section reach prodigious proportions. Large quantities of Ampelopsis, Jasmines, Clematis, Wistarias, &c., are grown.

HARDY FERNS.

My collection of these has recently been very considerably extended, and now can fairly claim to be a complete and representative one of Hardy British and American Ferns, and is a Catalogue well deserving of the attention of all who are interested in this useful class of plants.

HARDY PRIMULAS.

I hold a very extensive collection of these, which includes every variety claiming any real usefulness, amongst which are many beautiful Indian and other forms.

Copies of any of the above CATALOGUES may be had upon application.

THOMAS S. WARE,
HALE FARM NURSERIES,
TOTTENHAM, LONDON.

"THE DANIELS" POTATO.

Is the coming POTATO.

A cross between the White Elephant and Magnum Bonum, having the unequalled qualities of both. Ready to lift same time as White Elephant. An immense cropper, and of splendid table quality. All Potato growers should try it.

Price per peck, 3s. 6d.; per bushel, 12s. 6d.; per sack, 30s.

From Mr. J. ERR, Broom Park, Clebury Mortimer, Oct. 29:—"The seed Potatoes, The Daniels, I bought of you last spring have turned out remarkably well in quantity as well as quality; I had 286 lb. from 7 lb.; not one diseased."

From Mr. E. PITT, Ventnor, I.W.:—"From 2 lb. of your new Potato, The Daniels, I have raised 213 lb., of splendid quality."

A CHANGE OF SEED ALWAYS PAYS.

Before ordering your supply send for Daniels' Illustrated Potato Catalogue, containing valuable hints on the Potato, with descriptions of nearly 200 kinds, and the latest Novelties. Gratis and Post-free to all applicants.

DANIELS' CUCUMBERS

Are the Best in the World.

DANIELS' DUKE OF NORFOLK.

A magnificent New Variety, immensely prolific. Handsome dark green fruits, 18 to 24 inches long. Price 2s. 6d. and 5s. per packet.

DANIELS' MASTERPIECE.

A splendid New Variety, exceedingly handsome. First-class for Exhibition, and unexcelled for table. Price 2s. 6d. and 5s. per packet.

DANIELS BROS., The Royal Seedsmen, NORWICH.

1888.

WRENCH'S

SPECIALTIES of the SEASON.

BEAN—

WRENCH'S GIGANTIC RUNNER.

Pod perfectly straight, and of extraordinary length. Unrivalled for exhibition purposes. Tender and delicious. Proved last season to be unequalled.

Per Pint, 3s.; per Quart, 5s.

BORECOLE—

WRENCH'S VARIEGATED KALE.

Extra selected. Per Packet, 1s.

BROCCOLI—

SNOW'S WINTER WHITE.

A perfect stock of this unique variety.

Per Packet, 1s.

BRUSSELS SPROUTS

WRENCH'S "KING of the MARKET."

The largest, most prolific, and most delicate flavoured of all.

Per Ounce, 1s.

CABBAGE—

WRENCH'S NEW DWARF, "THE PIGMY."

The earliest and dwarfest variety in cultivation. Admirable for private gardens.

Per Packet, 1s.

CARROT—

WRENCH'S NEW MAIN CROP.

This splendid intermediate variety is somewhat longer than Nantes, and thicker at the shoulder, producing an enormous weight per acre.

Per Ounce, 1s.; less by the Pound.

CELERY—

WRENCH'S NOTTINGHAM RED.

The best variety for its delicious crispness and sweet nutty flavour.

Per Packet, 1s. and 2s. 6d.

LEEK—

THE LYON.

A regular prizetaker. Per Ounce, 1s. 6d.

LETTUCE—

WRENCH'S MAMMOTH SELF-FOLDING GREEN COS.

The best green summer Lettuce, standing a long time before running to seed. Very crisp and good flavour.

Per Packet, 1s.

PARSLEY—

WRENCH'S CHAMPION.

The finest stock in the world.

Per Ounce, 6d.

To be had Retail of all Respectable Seedsmen throughout the world, and WHOLESALE ONLY of

THE

Gardeners' Chronicle.

SATURDAY, FEBRUARY 25, 1888.

CONIFERS FOR CHALKY SOILS.

THE SPANISH FIR (ABIES PINSAPO).

NOT long ago a correspondent of the *Gardeners' Chronicle* pointed out how well suited this pretty and distinct Fir is for planting in chalky or limestone districts; and as this is not generally known, nor the advice acted upon, at least in instances where it might well be so, a few words of a supplementary nature may not come amiss at the present planting season. In the chalky districts of Kent this tree thrives with unusual luxuriance; indeed, nowhere have we seen either larger or healthier specimens than are to be found on many of the estates in that county. At The Rookery, near the now famous little village of Down, amongst a rich and varied collection of Conifers, we the other day were shown some of the largest trees of the Spanish Fir that it has yet been our good fortune to behold; and not only were these of unusual size, but with such a rich tint of bluey-green pervading the foliage that it was some time before we could recognise an old favourite, or believe that we were not being misled by some other and nearly allied form. The largest was fully 60 feet in height, with a beautifully rounded and gradually tapering stem, whose girth at 3 feet and 5 feet from the ground we found to be 7 feet 9 inches and 6 feet 11 inches respectively. From base to tip this peculiarly symmetrical tree is thickly furnished with branches, whose diameter of spread where they sweep the greensward is exactly 33 feet. The bole of this perhaps unique specimen, contains 67 feet of timber. Now, when we consider that the Spanish Fir was only introduced in 1839, or about forty-eight years ago, it must be admitted that the specimen whose dimensions we have just recorded, has made no bad use of its time. The upward rate of growth has been 15 inches for each year, assuming that it was planted the same year it was introduced to this country, and the annual cubic content of wood formed nearly 1½ foot. The soil on which this fine tree is growing is a sandy loam mingled with chalk, and resting at no great depth on pure chalk rock:

while the situation is fully exposed to the worst winds of that particular district. Not a hundred yards from this specimen grows another of almost similar dimensions, the bole of which girths 5 feet 11 inches at a yard from the ground level, while the branches cover a spread of nearly 30 feet in diameter. The same bright healthy look is noticeable about both trees, while the luxuriant foliage and branches, particularly of the latter, quite hide the stem from view. In various other Kentish gardens, and growing where only a few inches of loam overlies the chalk, we have noted how rapid of growth the Spanish Fir is, and how healthy and bright is the abundantly produced foliage. Where not a particle of limestone or chalk was incorporated with the soil we have noticed this Fir thriving, as we then thought well; but a comparison of such specimens with others growing on the warm chalky cliffs or limestone heds, the differences are marked—indeed, far more than we could have anticipated.

The *Willingtonia* (*Sequoia gigantea*) is likewise doing unusually well at the same place, one stately and robust-growing specimen being fully 60 feet in height, and with a trunk proportionately large. Being fully exposed, we did not expect this usually wind-shorn tree to have put on its best form on the eminence on which it is planted; but no doubt the peculiar quality of the soil—loam on chalk rock—had much to do with the bright pleasant green of the abundantly produced foliage. It is no uncommon thing to see the *Sequoia* "Carrot-shaped" in stem—that is, the lower portion of the butt out of all proportion in point of size to what it is further up, or in comparison with the height; and this we have noticed is usually the case when the tree is unsuitably placed, and in consequence becomes stunted in growth. The specimen under consideration was not so, for the stem had a gradual taper throughout, and rose as straight as a ship's mast for its entire height, the branches being rather longer and more lithe than is the case in the majority of specimens. Too often do we find this giant of the Fir tribe crowded up amongst other trees, and where its huge proportions are never fully developed, the lower branches being either dead or dying off piecemeal, and the tree with a scanty ill-begotten appearance, that renders it anything but an ornament to the grounds it is intended to embellish. This, we need hardly say should never be tolerated, for it is far better to have half-a-dozen trees with well furnished healthy foliated stems than half a hundred crowded and cramped together, and whose natural beauty, owing to not being allowed sufficient room for lateral development, can never be fully appreciated. The *Sequoia*, like the *Araucaria* and the Spanish Fir—indeed, the majority of trees—cannot abide being overcrowded, or shut in by other subjects; so in order to have good shapely specimens, give plenty of room for the branches to become perfectly developed.

The *Mount Enos Fir* (*Abies cephalonica*) is, as might be expected from the limestone rocks of its native habitat—the Black Mountain in Cephalonia—well adapted for growing in the chalky districts of southern England. [It is, however, spring-tender when young. En.] In several gardens and parks that we have visited lately, particularly in north Kent, this pretty and desirable Fir has rather surprised us with its rapid growth and abundance of the brightest and healthiest of foliage. Some places where we saw it of unusually strong and robust growth the soil was little more than pure chalk, with a small admixture of loam or vegetable mould, and yet in such it seemed quite at home, the annual growths being stout and well matured, and the foliage such as betokened perfect health.

The number of evergreen trees that succeed in anything like a satisfactory manner on chalk soil is well known to be limited; and how great a thing it is that two so beautiful and hardy subjects as the Spanish and Mount Enos Firs there find their most congenial home and put on their best form even where but a few inches of soil overlies the chalk.

Some of the first plants, raised from seed sent home by Sir Frederick Adam about 1824, are growing at Blairadam, in Scotland, and the following measurements, supplied to us by a kind friend there, show that these trees, at least, have not succeeded in a very satisfactory manner, and cannot compare with others planted several years afterwards and in soil

composed largely of chalk. The measurements were taken two years ago. No. 1, height, 35 feet; stem girth at 3 feet from the ground, 4 feet 4 inches. No. 2 is 38 feet in height, and girth 4 feet 11 inches at a yard up; while No. 3 stands 36 feet in height, and has a stem girthing 3 feet 8 inches. These trees are coarse and ill-grown, and have repeatedly lost their leading shoots. Those who are interested in this distinct species of Fir should refer to that pleasantly written book, *The Colonies*, by the late Sir Charles Napier, when Governor of Cephalonia.

We have ourselves measured, not one, but many specimens of the Mount Enos Fir growing in various parts of the country of from 50 to fully 60 feet in height, but in most cases the soil on which they were growing was either of a calcareous or chalky nature.

The *Weymouth Pine* (*Pinus Strobus*) has more than once been recommended as a suitable tree for dampish, nay, even damp soils, but such statements we could never corroborate, at least from our observations or experiments. That it is a valuable adjunct to the list of such as succeed on chalk we make bold to announce, and more than one of the readers of the *Gardeners' Chronicle* will take up the cudgels in our behalf on this point should such be required. We had often the night, when viewing those grand 90 feet high specimens, whose stems were straight as arrows, branchless for three-fourths their length, and upwards of 8 feet in circumference, in the grounds at Gwydyr Castle, in North Wales, that the soil which reared such giants must have peculiar suitability for the work in hand. Rocky, partially slaty, *débris*, with a small quantity of decayed vegetable matter atop, were the principal component parts of the soil that produced the Gwydyr specimens. No such trees as the *Weymouth Pine* have we yet met with in the "Garden of England" as were those Welsh specimens; but in judging from trees of perhaps forty years' growth, growing on chalk rock, there can be little doubt that in years to come, should no accident befall them, the dimensions of the Kentish trees will be well worthy of record. A few days ago we could not help admiring the bright healthy appearance of the specimens of *Strobus* that lined one of the roads here, and which in company with the Scotch Pine and numerous hardwoods, lent quite an unusual air to the landscape. What a pity it is that the *Weymouth Pine* gets so "bedraggled" in wet weather! Then it looks miserable indeed, just as if it had been dragged through a pond and reinstated in position again; and what is rather strange, the dripping of moisture from the foliage of this Pine is a singularly slow process, and this we have noticed for many years past, but how to account for such has proved a puzzle.

It cannot be denied that the state of the weather exerts a powerful influence over trees and shrubs, particularly in their appearance, for when, may we ask, does the Weeping Spruce (*Picea Morinda*) look half so beautiful as when subjected to a couple of days' clear frosty weather?

The *Scotch Pine* (*Pinus sylvestris*) ranks high as a tree for planting in chalky soils, as any one must admit who has travelled through some of the southern English counties. Near the chalk pits at Down, just at the division of Earl Derby's and Sir John Lubbock's estates, is a noble clump of the Scotch Pine, and I have never seen a better example than is here presented of Darwin's "survival of the fittest," for, owing to Nature having been allowed her own way, the strongest trees are gradually killing out and exterminating the weaker. But this is not all, for by such a course of natural treatment, clean, straight, and almost branchless trees are produced, and which when compared with such as have been allowed room to develop their side branches, are vastly superior, for economic value at least. From this we do not, however, wish to calculate that Fir plantations in this country—which is widely different from Norway, Sweden, or Canada—should not be thinned, but what we have oft before said, and again repeat, that in order to grow timber, particularly Pine, for profit, an unbroken leaf canopy must be preserved throughout the entire woodland. But where the value of the timber produced is only of secondary importance, and the production of ornamental, far-spreading trees forms the primary object, by all means give plenty of room for lateral development of the branches; but do not expect clean and valuable timber as well, or you will be sadly disappointed. It has always been my motto, where practicable, to show off the stem of any tree where this is of large size and well formed, and it is a question whether these fine columnar trunks do not add considerably to the ornamental aspect of such specimens, more so, we believe, than if they were clad to the ground with

the greenest of foliage. Tastes differ, and some estate-owners would consider it but little short of an act of vandalism were their foresters to show off, by pruning, the stem of any tree, be it ever so large and well-proportioned. But we are wandering from our subject, and in returning may say that the clump of Scotch Firs above-mentioned, is growing on a bed of chalk with a quantity of loam atop, and not far distant from where chalk for building purposes is procured.

The *Giant Arbor vite* (*Thuja gigantea*) should be made a note of by proprietors who own tracts of chalky or limestone ground, for it is peculiarly well-suited for planting in such. This beautiful, fast-growing, perfectly hardy, and valuable timber-producing tree is fast coming to the front for afforesting purposes, and most growers find it somewhat difficult to meet the demand. Thanks are due to several readers of the *Gardeners' Chronicle* for recording their observations in various parts of the country, and thus bringing publicly to notice the merits of so valuable a tree. We saw it the other day growing with great luxuriance where chalk was freely commingled with the soil, and Sir C. W. Strickland, of Hildenley, Malton, informs me that he has it growing with extreme vigour on thin soil upon limestone-rock and where Larch had several times been planted with little or no success. Taking everything into consideration this is a capital tree for general forest planting anywhere in the British Isles, and we may well ask the question, "Who has ever known this tree to be uprooted by the wind or to lose its leading shoot even during the most severe and long-continued storm?" [We have ourselves had one tree overthrown. Eo.]

The *American Arbor-vita* (*T. occidentalis*) also does well when planted in chalky soil if this be not too dry. For forming a screen fence this tree or big shrub is admirably adapted, but for timber purposes, or as an ornamental subject, we will not say much in its favour, at least as grown in this country.

The *Larch* does better when planted on chalk soil than would be imagined, and enquiries made by us only prove the accuracy of what we every day see on the downs of Kent. These are a few of the coniferous trees that we have, from actual observation, found to be well suited for planting on chalk, but we will advert to the subject on another occasion, and then record a list of such deciduous trees and shrubs as seem to be in every sense of the word adapted for use in similar situations. *A. D. Webster.*

ORIGANUM HYBRIDUM.

FROM Mr. C. Wolley Dod I received, some time ago, a specimen of a very ornamental *Origanum* which he says he received some ten or twelve years ago under the name of *O. pulchellum*. This plant is the same as Mr. Dewar wrote about at p. 71 of the *Gardeners' Chronicle* for July 16, 1857, under the heading of *O. Tournfortii*, and which he there correctly identified with a specimen of Bishop Goodenough's in the Kew Herbarium labelled *O. hybridum*, with the note, "hybridum *O. Dictamnus* matre, *O. siphyleum* patre? vel e contra," and as Goodenough's herbarium was formed probably between 1780 and 1800, it is, no doubt, the plant described by Miller as *O. hybridum* in the eighth edition of his *Gardeners' Dictionary* (dated 1768). *Origanum*, n. 12, which name is corrected in the list of errata at the end of the work to *O. hybridum*, as it appears in later editions of that work, where it is considered to be a variety of *O. dictamnus*. Mr. Benthams, in De Candolle's *Prodromus*, quotes "*O. hybridum*, Mill. *Dict.*, n. 12," as a synonym of *O. siphyleum*, but certainly Goodenough's and Mr. Dod's specimens (which admirably agree with Miller's description of *O. hybridum*) are quite distinct from *O. siphyleum*, which is a glabrous plant, with smaller leaves of a different texture, whilst *O. hybridum* is softly hairy, except the inflorescence. It is also quite distinct from *O. dictamnus*, which I believe is a much less hardy plant. From *O. Tournfortii*, under which name Mr. Dewar says that it is grown in gardens, it differs in being hairy, the true *Tournfortii* being quite glabrous. With regard to *O. pulchellum* (Boissier *Flora Orientalis*, vol. iv., p. 547), I am unable to say with certainty if it is the same as *O. hybridum*, as there is no specimen of *O. pulchellum* in the Kew Herbarium, but Boissier's description quite agrees with Mr. Dod's

FIG. 37.—ORIGANUM HYBRIDUM, MILLER.

by Boissier as *O. pulchellum* is a descendant of the plant mentioned by Miller, and if it really came from the East (that is, the Levant), and, as I believe, is really the same as *O. hybridum*, it is very interesting as proving that species originate naturally by hybridisation as well as by artificial aid. Gardeners will please note that the name to adopt for this plant is *O. hybridum*, which has the priority of ninety-one years over the name *O. pulchellum*, the latter being first published in 1859. The allied species of the group to which *O. hybridum* belongs, such as *O. dictamnus*, *O. Tournefortii*, *O. sipyleum*, &c., are all ornamental plants, and one or two of them some years ago were favourite cottage window plants, but of late years I have seen them but rarely. (See fig. 37). *N. E. Brown.*

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM CHRYSSEUM, Rolfe, n. sp.

A DEEP yellow flowered *Dendrobium* has just been sent to me by Messrs. James Veitch & Sons, of Chelsea, with the remark that it passed into their hands as an Assamese importation, and is distinct from anything known to them. I, too, am unable to identify it with anything already described, and therefore propose for it the above name. Its flowers are a rich golden-yellow, almost orange, and with much of the appearance of those of *D. chrysanthum*, but it belongs to the racemose group, called by Bentham *Eu Dendrobium calostachyæ*, and not to *fasciculatæ*. Pseudobulbs $1\frac{1}{2}$ foot long, erect, arching above, slender, $\frac{1}{4}$ inch broad, nodes $1\frac{1}{4}$ — $1\frac{1}{2}$ inch apart, sheaths white, reaching to node above. Leaves linear-lanceolate, acuminate, probably 3—4 inches long. Racemes lateral, 1—2 inches long, two to three-flowered. Bracts short and tubular at the base, almost overlapping, the upper ones oblong obtuse, $\frac{1}{2}$ inch long, all striate and pale green, the lower ones marbled with dark purple. Segments subacute, $1\frac{1}{2}$ inch long, the sepals oblong, petals broadly elliptical, lip orbicular, minutely pubescent, and with a minutely fimbriated margin. The only departure from uniformity of colouring is, that the front of the lip is a little paler than the rest of the flower, and there are a very few faint crimson lines on the side lobes near the base. Though the racemes are short, the affinity is unmistakable, the very characteristic bracts being precisely of the type of *moschatum*, *clavatum*, and others of the group. There are several plants, each behaving alike, but I believe the short racemes arise from weakness, through not being established after importation, especially as many of the flowers have not opened properly. When established it will most likely improve, and not unlikely the foregoing description will require amendment in a few points. *R. A. Rolfe.*

MASDEVALLIA CUPULARIS, Rolfe, f.

When Herr Oberhögartner Herrmann Wendland made his trip to Guatemala and Costa Rica—unfortunately a very short one—he was the first who explored those hunting-grounds, but he selected with the eye of a botanist. Thus the number of new discoveries made in a few months was very considerable. One of those discoveries was *Masdevallia cupularis*, found on August 5, 1857, in Costa Rica. All I knew of the plant for a long time consisted of two dried specimens. After an interval of twenty-seven years the plant was once more found in Costa Rica by Mr. F. Sander's traveller, Mr. Hübsch. In December, 1887, a plant obtained from Mr. Sander flowered with Herr Baron Hruby von Telenyi, of Peckan, under Mr. Pfau's excellent management. The same plant flowered nearly at the same time with Mr. F. Sander. It has small oblong blunt shining leaves, emarginate at the base. The flowers, evidently showing the typical characters of the *Coriacea* group, do not exceed 2 inches in length when much developed. The tails are nearly equal to the body, and the midribs from which the tails extend are green. The remaining part of the outer perigone, the cupula, is light brown, with

plant, and as he received it under the name of *pulchellum*, I have no doubt that it is the right plant, which Boissier states came from the East to the Paris gardens, where it was cultivated as *O. dictamnus* and *O. pseudo-dictamnus*. This is an interesting point, because Miller also states under his description of *O. hybridum*, "I have also dried samples of another variety, which arose from seeds in the Leyden Garden;

the seeds were sent from Paris by the title which Tournefort gave to that which he found in the Levant" (that is, *Origanum Dictamnus cretici facie*, now called *O. Tournefortii*), "which I have joined to the variety before mentioned" (*O. hybridum*). By which I understand that Miller considered the Leyden plant (originally from Paris) as the same as his *hybridum*. And it is quite possible that the Paris plant described

numerous brown spots, so densely arranged that the surface appears quite brown. It is very markedly glossy. The petals and lip are ochre-coloured—petals with a mauve mid-line and spots of the same colour on each side of the mid-line. Lip with three brown longitudinal lines on the anterior lobes, with numerous brown spots on the side-lobes. Column green, white at the top. The inside of the cupula is very dark brown.

It is not a grand Orchid, but a Masdevallist will appreciate its peculiar qualities; and last, not least, it is very scarce. Very few, excepting myself, have it. It is a very slow grower. *H. G. Rehb. f.*

LÆLIA ANCEPS MUNDA (*Rehb. f.*) and *L. A. ROSEA* (*Rehb. f.*).

I hear that these two varieties are believed by some to be synonymous. Some would gladly adhere to this opinion, if *munda* and *rosea* were really identical. If we look to the types or to the original descriptions we find we cannot follow this innovation. *Lælia anceps rosea* appeared at Mr. W. Bull's in December, 1879, and was very much admired there by our lamented friend, Mr. J. Day. It has the mid-lacinia of the lip acute and short, and the flower is mostly of a delicate rose colour. *Lælia anceps munda* is an introduction of Herr Consul Kienast Zölly, of Hirslander, Zurich, in 1886. It is one of the whitest forms of *anceps*, with the most delicate hue of red nerves on the lip, whose mid-lacinia is blunt. It is the sister of *vestalis*, the treasure of Sir Trevor Lawrence, and *alba*, the pride of Mr. W. Bull and Herr Heinrich von Ohlendorf, Hamburg, the possessor of a select Orchid collection kept in an excellent manner by Mr. Blythe. *Munda* is distinct from both in its very light rosy nerves on the side-lacinia. The other white *anceps*, Dawsoni, Sanderiana, Schroderiana, Williamsiana, Stella, have very deep coloured blotches on the lip. *H. G. Rehb. f.*

AVAILABLE FOOD FOR THE PEOPLE.

A PAPER bearing this title was read by Mr. D. Tallerman, in the Hall of the Bakers' Company, Harp Lane, Great Tower Street, E.C., on the 15th inst., it being the fourth of a series of lectures, and its scope, in common with that of the other three, was to put forward the scientific, mechanical, and practical arrangements that enable foreign produce to displace home-grown food in British markets. This particular paper deals with "The Results and their Remedy." The Earl of Winchelsea occupied the chair, and there was a fairly good attendance. Various coloured diagrams on the walls served to illustrate some of the points put forward by Mr. Tallerman.

The Chairman said the supply of food was a matter of national importance. They were to a large extent an agricultural community, and the question was therefore one specially of interest. It is a good policy to get as large a supply of food as possible from home.

Mr. Tallerman called attention to the fact that while British agriculturists were in a desperate position, farmers in foreign lands, far and near, are enabled to send their produce to British markets, and successfully compete with home farmers on their own ground, notwithstanding the unequal terms upon which they contend; while our own agriculturists, although surrounded by larger groups of consumers than will be found in similar areas in any part of the world, suffer from such an unbearable depression that the lands are gradually going out of cultivation, while the agriculturists of distant lands destitute of consumers, can profitably supply our markets, their industry prospering and rapidly developing itself to a remarkable degree. Three terms may be used as setting forth the means by which these great results have been achieved by others—1st, Combination, or the systematic organisation of the owners of pro-

duce and material for their economic production, utilisation, collection, distribution, and realisation. 2nd, Refrigeration, or the systematic application of the known natural law for the preservation of perishable foods by means of a dry, low temperature. 3rd, Evaporation, or the systematic application of the known natural law for the preservation of perishable produce by means of a dry, high temperature. Foreign combination operated to send us a large portion of the 160,000 tons of butter and cheese that reached us last year, and for which we paid £12,000,000 sterling; preserved meats to the value of £1,500,000 sterling, and £1,000,000 sterling worth of fish, fruits, and sundries. Refrigeration was the means by which in the same period we imported 80,000 tons of fresh beef and mutton at a cost of £3,500,000 sterling. Evaporation was employed in the preparation of the 500,000 cans of condensed milk, also the large quantities of dried fruits and vegetables we received, only a very small portion of the respective crops preserved by the farmers of America, Canada, and Eastern Europe. After dwelling in detail upon the means by which these systems are utilised abroad, he thought that in the important particulars he set forth will be found the germ of the success that must attend home over foreign operations, when the time shall arrive for refrigerators to be utilised in connection with the distribution of fresh meat by the British farmer. After showing the advantages enjoyed by the home farmer—especially mentioning two—1st, the small cost of the temperature necessary to keep the meat in good condition; 2nd, the short time occupied in its transit from producer to consumer—Mr. Tallerman went on to dwell in detail upon the processes by which the results might be attained; he applied his remarks to Wheat, meat, flour, dairy produce, and fruit. Under the last heading some very interesting information was given, to which further reference can be made. Proceeding next to dwell upon the commercial phases of distribution, he deplored the lack of the commercial mind in the English agriculturist, especially in relation to the ever important economic axioms that "the supply of an article tends to create the demand for it," and "the demand establishes its value." By way of practical results he would operate through Chambers of Agriculture, Farmers' Clubs, Trade Societies, Working Men's Clubs, &c., so as to secure the combination of producers and consumers for their mutual interest. The essential point to be understood is the fact that the operations necessary to bring producer and consumer into direct communication as sellers and buyers are of a purely mechanical character. The food material exists in one direction, and the means wherewith to purchase it in another. The problem lies in the provision of a ready means by which those who have particular commodities to sell can be brought into contact with those who wish to purchase them.

Farmers and their landlords, with working men and their employers, may well deal with the subject from one common standpoint, and consider how a working arrangement for bringing home producers and home consumers into definite contact can well be brought about. Both parties have large organizations that may be usefully occupied. Agriculturists have their Royal and County Societies, Chambers of Agriculture, and Farmers' Clubs. The industrial bodies have their Trade Societies, Unions, Co-operative Stores, and Clubs. Let the representatives of both meet, and take some steps by which the supplies of the one and the demands of the other can be adjusted, and a fairly remunerative price may be readily arrived at for one to pay and the other to receive. The paper concluded with references to the position of the middleman, the masses and their meals, and the railway difficulty and how to deal with it, to which subject also a further reference will be made.

A brief but interesting discussion followed, which was closed by Lord Winchelsea proposing a resolution to the following effect:—"That the time has arrived when home producers should adapt themselves to the altered circumstances of the home market, and com-

bine in the same manner as the foreigner in order to bring their products directly to the consumer." This was seconded and carried, and the proceedings closed with hearty votes of thanks to Mr. Tallerman and to the Chairman.

THE BULB GARDEN.

THE EARLIEST FLOWERING CROCUSES.

I HAVE before me as I write six distinct species of *Crocus* gathered in the open garden, and in some instances protected by glass; they are singularly pretty in January and February, but we seldom get enough sun to open the flowers either out-of-doors or under the glass lights; but when the flowers are cut and placed in glasses in a warm room at night they open as freely as if they were exposed to bright sunshine; and the colours are most charming by artificial light. *C. alatavicus* has been gathered from a clump quite in the open ground on February 9; it is a distinct and charming species. The inner segments of the perianth are of the purest white, the outer segments are also white, but the outer surface and the scape is of a dingy purple. *C. Imperati* is also very pretty, though a common species; the segments of the perianth are lively pale purple, the outer surface of the outer segments is buff, with deep purple lines. *C. corsicus* is much like it, and they have both flowered together. *C. carpatanus* is quite distinct from any other flower at this time. The flowers are of a delicate lilac colour, flushed with yellow at the base of the segments internally. Mr. Maw, the authority on the *Crocus*, says it flowers from February to April, and as late as May, in its native habitats.

We have also in flower together two species of a deep yellow colour, of which *C. ancyrensis* was the first to flower in a cold frame, and about the middle of January. The colour is rich orange, and the flowers are small; from the other—*C. chrysanthus*—I gathered flowers on February 9, which opened at once in the room in the evening by artificial light. This was the variety *fusco-tinctus*, whose flowers have perianth-segments of deep orange, the outer ones externally suffused with brown. This species is very variable, as besides the yellow normal form there are also white, blue, and blue with white varieties. The frost does not seem to injure the flowers, for they may be quite stiff with the frost, and when a thaw comes they may be gathered to open in the house, and are very pretty arranged in small vases. *J. Douglas.*

LILIUM THOMSONIANUM.

This seems to be one of those plants about which doctors differ. Wallich made a new genus of it called *Notholirion*, then Don, in *Prod. Nep.* 51 (1825) called it *Fritillaria macrophylla*. Wallich, 1832, called it *Lilium roseum*, *Wall. Cat.* 5077, under which name it was figured in *Bot. Mag.*, t. 4725, and again in *Belg. Hort.* (1853), t. 21. In Rözel's *Illustrations* (1839), t. 91, Don again named it *Fritillaria Thomsoniana*: while Lindley (1845), *Botanical Register*, 31, t. 1, gave it the name above quoted, and Griffith in his *Icones*, t. 277, named it *L. longifolium*. In the *Genera Plantarum* the name given by Lindley is cited, with the remark that the floral characters are nearer *Lilium* than *Fritillaria*; and as it will be less confusing to follow the standard laid down by Bentham and Hooker, we have adopted the name given by Dr. Lindley. The Messrs. Loddiges are said to have been the first to flower it in this country; in April, 1844, and although an interesting plant it has probably not been deemed sufficiently good as a florist flower to include in general collections. It does not, however, lack beauty, a few of the coloured drawings we have seen representing fairly sized flowers of a pretty delicate rose colour, while the form in flower at present in the herbaceous department at Kew is a creamy-white with greenish tips, and a very faint fragrance, and corresponds in every way with a photograph of a plant flowered by Herr

Max Leichtlin a few years ago. It seems to be widely dispersed. Lindley gives Mussoore, others give Almoro, 5000 feet elevation; Afghanistan, 5000—6000 feet, &c., while the bulbs of the above plant were received from Hazara, Afghanistan; a few years ago. Its leaves are over a foot long, lanceolate. *D.* [A good figure is given at p. 773, vol. xxi., 1884.]

FŒNESIAS.

When pure white sweet-scented flowers are required during the early autumn and winter now is the best time to plant the bulbs, as the best matured bulbs arrive in England from Natal at this season of the year, and, if not planted before next autumn, they very often fail to start into growth; hence the complaints made by some growers. *F. refracta alba* is one of the best varieties, and if planted at once, say, six bulbs in a 5-inch pot in good fibrous loam and peat of equal quantities, with a plentiful addition of sand, with good drainage, the pots should be placed in gentle bottom-heat in cocoa-nut fibre until they have made a growth of a few inches, when they should be exposed to the light and kept at a temperature of about 55°—60°, giving them an abundant supply of water. *J. G. Hill.*

ORCHID NOTES AND GLEANINGS.

CATTLEYA VELUTINA VAR. LIETZEI, *Gartenflora*, 1888, t. 1265.

A BRAZILIAN species, with elongated pseudobulbs, lanceolate leaves in pairs at the end of the bulbs, and flowers in loose terminal racemes. Each flower is about 3 inches across, with oblong acute spreading segments of an olive-colour, spotted with sparse red spots; the lip is whitish, convolute in the basal half over the column, expanded in front into a broad rounded and yellowish lip with numerous radiating stripes.

LÆLIA PORPHYRITIS, *Revue de l'Horticulture Belge*, February, 1888.

Flowers like those of *Lælia pumila*, with oblong acute segments of a dull purplish colour, a lip the basal two-thirds of which are convolute around the column, and a roundish terminal lobe of a rich carmine colour.

ONCIDIUM MANTINI, Godefroy, *Orchidophile*, February, 1888.

A supposed hybrid between *O. Marshalli* and *O. Gardneri*. The flowers are in racemes, each exceeding 3 inches in diameter, with oblong sepals, shorter than the oblong obovate retuse spreading petals; both sepals and petals yellow, with a large central blotch of chestnut-brown. Lip with a narrowish stalk, dilating into a large roundish yellow anterior lobe, sprinkled with a few purplish-brown spots.

PAPHINIA CRISTATA VAR. MODIGLIANA.

This elegant Orchid, described in the *Gardeners' Chronicle*, 1888, is now illustrated in the *Lindenia*, t. 117. It has pendulous racemes of starry white flowers, each about 2½ inches across. The typical plant has, as is known, purple flowers.

CYRIPEDIUM HARRISIANUM × VAR. SPERNUM.

One of Messrs. Veitch's hybrids, raised between *C. villosum* and *C. barbatum*. Leaves mottled; peduncles purplish, villose. The upper sepal is broadly ovate acute, with a reddish-purple ground marked with darker nerves, and edged with white. The lateral petals are oblong obtuse, dull purple; lip thimble-shaped, purplish. *Lindenia*, t. 118.

DENDROBIUM ROTRIFERUM.

This remarkable New Guinea Orchid, described in the *Gardeners' Chronicle*, p. 746, December 17, 1887, is now figured in the *Lindenia*, t. 119. It is evidently a most remarkable species, with elongated, slender pseudobulbs, lanceolate leaves, and short dense ra-

comes of pinkish flowers, each about three-quarters of an inch long, and resembling a sabot or shoe in form. It is to be regretted that no analysis accompanies the illustration of so remarkable an Orchid.

CATASETUM PULCHERRUM.

A curious species, with flowers 1½ inch, segments oblong-lanceolate, green, with horizontal purplish-brown bars and an orange-yellow boat-shaped lip. Figured in the *Lindenia*, t. 120.

ARRANGEMENT OF HOT-WATER PIPES.

CONSIDERABLE advance has been made during the last few years in the construction and internal arrangement of plant-houses, and this is most conspicuously the case in the matter of ventilation. Not many years ago the only purpose ventilators were supposed to have was as a means of regulating the temperature, the necessity of a supply of fresh air to the plants at all times and in all seasons being almost if not entirely overlooked. This is now remedied, and we have our ventilators arranged so that fresh air is constantly entering the houses, the result being an improvement in the health and vigour of the plants.

In like manner our heating arrangements have been improved in various ways, the most important being the distribution of the pipes in the houses. The old and, I may say, stupid plan was to place all the pipes under the side stages, partly, I suppose, to get them out of sight, and partly because it was thought they were as well there as anywhere else. In small, narrow houses this was no doubt right, but in large wide structures it was utterly wrong. I have to do with an old house which is an excellent example of what I mean. In it there are eight rows of pipes under each side stage, and the house is so large that in very cold weather these pipes have to be kept so hot that they cannot be touched, otherwise the temperature of the house would be too low.

In winter all plants should rest, but what rest can there be for the plants which stand upon these stages, beneath which there are eight burning-hot pipes? The stage gets hot, the gravel dry, the soil baked, and the plants covered with insect pests of all kinds; or, if this is prevented by pouring water on the stages and by frequently watering and syringing the plants, then quite as much harm is done by the excessive heat and moisture at a time when these should be kept at a minimum. Evaporating pans are quite as bad as the frequent watering, except that they save labour somewhat. The air about these shelves is necessarily much hotter than it is further away when the heat is diffused. Had these sixteen rows of pipes been distributed over the house, having, say, four rows on each side under the stages, and the other eight rows in chambers on the sides of the central path, four on each side, it is obvious that they would have done their work better, and the shelf plants would have escaped treatment which at present is simply either baking or stewing.

But the sixteen rows of pipes are clearly insufficient to heat the house under notice for the following reasons:—

When pipes are heated to such a degree that one cannot place his hand upon them for a moment they become dangerous to the plants about them. Fierce heat like this is bad for both man and plant. Every gardener understands the term "stinking heat," and knows that it does harm, but in houses where there are not sufficient pipes this disagreeable heat is unavoidable in very cold weather. Had there been twenty-four rows of pipes in my house instead of the sixteen, and these properly distributed over the house, then they would have done their work satisfactorily without "stinking."

The house for Cattleyas, built by Messrs. Veitch about three years ago, affords a good example of how pipes ought to be arranged in a house, and the

wisdom of using sufficient. This house is 22 feet wide by 132 feet long, and 14 feet high, and although an intermediate temperature is all that is required, yet sixteen rows of pipes run from end to end, and they are spread right across the house. This house has proved a perfect success for Cattleyas—no mean test. Other modern houses could be named as instances of improvement in this direction, but this is sufficient to prove my point.

The first cost of extra piping is as nothing when compared with the immense advantages it gives, and there is no excuse now-a-days for such bad arrangements as would make it necessary for the whole of the pipes to be under the side stages.

I have lately discussed this matter with several who do not appear to be quite clear as to the advantages of the arrangement here insisted upon; possibly others interested will let us have their views upon what must be considered of much importance horticulturally. *W. Watson, Kew.*

CULTURAL MEMORANDA.

THE TUBEROSE.

THIS bulb should be grown by every one who has a hotbed and a greenhouse from which frost can be excluded. The best bulbs sold by most of the nurserymen at 30s. per hundred are the cheapest in the end, inasmuch as a large percentage of the bulbs sold at a much lower price will not throw up a flower-spike. A small batch of tubers should now be potted into 3-inch pots in light sandy loam, burying the bulb three parts deep in the soil, and taking care to first rub off any bulletts that may be attached, for herein lies the secret of success in flowering the Tuberose. Every sucker that springs from parts other than the apex of the bulb should be removed as soon as they appear.

Plunge the pots to the rim in a bottom-heat of 80°—85°, and apply water very sparingly to the bulbs until active growth has commenced. When the flower-spikes have attained to a height of 6 or 7 inches shift the plants into 6-inch pots, and grow on near the glass in any warm frame, pit, or house that may be at hand, withholding water from the roots until the latter have pushed into the new soil, and damping the plants overhead morning and afternoon on bright days to keep them free from the ravages of red-spider. As soon as the roots have pushed well into the soil a slight sprinkling of Beeson's manure twice a week before giving water at the roots will tend to the production of finer flowers than would otherwise be obtained. The flower-spikes should have supports. The Pearl, a dwarf-growing American variety, is one of the best varieties.

WINTER-FLOWERING BEONIAS.

The present is a good time to take cuttings of this useful class of stove flowering plants. Cuttings from 2 to 3 inches long inserted in 3-inch pots filled with light sandy mould, put in heat and watered, will soon take root. They should then be potted singly into small 60-sized pots, put back in heat near to the glass, watered, and shaded from the sun for a few hours daily until the roots have taken to the soil, when it should be discontinued. Pinch the shoots a few times to insure dwarf bushy plants; give water at the roots when needed, and shift the plants into larger pots—48's and 32's—when they require more room at the roots. Plants thus raised will be much admired when used for furnishing purposes before the close of the present year, and as cut flowers. *H. W. Ward.*

GLOXINIAS.

To obtain good blooming plants, seed should now be sown, and from this sowing plants will be produced which will flower in the late summer and autumn. The seeds, being very small, should be sown thinly on the surface of the compost, when it has been made quite level, and be just covered with sand. The plants will soon appear, and should be

pricked out when of small size a dozen or so in a 60-sized pot. When the leaves have met together they may be potted off, but this time three in a pot, and kept in a minimum temperature of 60°, with a moist growing atmosphere; the plants grow very rapidly, and in three or four weeks will require to be repotted singly. The best potting materials are loam and peat in equal portions, with a little decayed manure, and some sharp sand, with good drainage. I grow the two-year-old tubers in 8-inch pots, and very beautiful specimens these make for large houses. They are seldom attacked with insect pests if the temperature and atmospheric conditions are right. *J. Douglas.*

ROSES.

THE SCOTCH ROSES.

At a meeting of the Royal Horticultural Society held in June last, a collection of cut Roses was shown of a very interesting character, representing groups the flowers of which are seldom seen by those who do not grow them. The Scotch Roses were well represented. This Rose is a native of the North of England and Scotland, and can be found wild in many parts of the country. When I was in Llandudno in May, 1886, I found a variety of Scotch Roses growing on the hills, all single and white, but varying in the size and slightly in the colour of the blotches surrounding the centre. From seed many pretty and interesting varieties have been raised, and it is only of late years that their charms have been appreciated as they ought to be, for they are very pretty and sweet-scented: and they bloom early in spring before any other Roses. Among those exhibited were the double white, Gil Blas, delicate blush (double); Mrs. Stirling, bright rosy-pink, very pretty indeed; Scotch Provence, delicate pink; Mrs. Tritter, delicate pink and white; Duchess of Bedford, a little paler than Mrs. Stirling; and Stanwell Perpetual, large, double, and delicate blush in colour. When in Wales I made an effort to secure a few of the best varieties on the hills, but of those I brought away only two survived, which I hope to flower this year. In searching for the roots it was remarkable how far they had travelled between the rock and the turf which covered it. Hot and dry as the position seemed they were flowering very freely indeed. With those seen at South Kensington the exhibitors had set up some charming bunches of the Austrian Roses, viz., the Austrian Copper, with its large single blossoms; the double Persian Yellow, the deepest in colour; and the fine double golden-yellow Harrisoni. That they were much admired goes without saying. *R. D.*

NEGLECTED ROSES.

I would venture to add the following Roses to the list given by "Wild Rose" in a recent number of the *Gardeners' Chronicle*, and which are all too seldom seen in gardens:—

Auguste Mic.—This is one of the most delicate and perpetual-flowering of the unique-coloured, light, glossy pink Roses.

Jules Margottin.—No garden was considered complete in its Rose furnishing a few years since without Julia, as this popular favourite was commonly called some twenty years ago; now, such a familiar name would beget a bewildered stare, and you may enter scores of gardens without finding one lighted up by the light cherry-coloured blossoms of this most free-blooming, useful Rose.

John Hopper.—This popular favourite, though only twenty-six years old, is gradually disappearing also, though it is unrivalled in good qualities, and certainly is not yet superseded in its not very numerous class of bright rose on a base of pale lilac.

Duchess of Sutherland.—This is one of the oldest and still very best of our rosy-pink, exquisitely-cupped Roses, of vigorous habit and robust constitution.

La Reine.—These two are placed together, as they

were the first two perpetuals grown by the writer. *La Reine* also resembles the *Duchess* in form, though the flowers differ widely in colour; the latter, indeed, vary considerably on different soils, sites, and plants, and sometimes on the same plant. Their normal colour is rose, shaded with lilac, occasionally with crimson.

Centifolia rosæ.—This Rose is but a quarter of a century old, and already it is on the wane, and yet it is one of the most beautiful and fragrant of our bright light Roses. Being much shown in the early period of its history, and being apt to show its eye at times through the thinness of its petals, a prejudice was raised against it, though it is one of the choicest of our cupped Roses.

Fisher Holmes, a Rose about the same age, is disappearing from similar causes, though it is one of the most brilliant of our crimson-scarlet Roses.

Duchesse de Caylus, too, one of the most brilliant and most fragrant of our brightest carmine-red Roses, is going out of fashion before our eyes, because it is not such a Cabbage as *Paul Néron*, nor equal in bulk to many others.

Madame Knorr.—Bright Rose, fading into paler edges, beautifully cupped and fragrant.

Madame Laffay.—It seems but as yesterday that this fine crimson Rose was as popular in any garden as *La France* is to-day, and already it is not only neglected, but forgotten by most growers.

And such brilliant companions as *Marie Rady*, *Maréchal Vaillant*, and *Senateur Vaisse* seem almost in danger of slipping into the ranks of the neglected, unless "Wild Rose's" timely notes make rosarians pause, ponder, and re-weigh all Roses, old and new, on their merits.

I trust that when "Wild Rose" picks out the neglected from other groups he will not fail to do justice; to possibly the most beautiful, as well as the most neglected of all pink Roses, *Compe d'Hebe*, and its companion in neglect, though not quite its equal in beauty, *Charles Lawson*. *Rosa.*

THE ABIES NOBILIS AT THORPE PERROW.

THE specimen of *Abies nobilis* (fig. 38) is growing in the gardens of Thorpe Perrow, Bedale, and has, says Mr. Culverwell, the gardener, a little history of its own. "The tree was bought of Messrs. Knight & Perry, then at Chelsea, just one year before I came to this place in 1848. The tree, like many others, was planted in a secluded corner for shelter; this turned out to be a mistake, as the plants became drawn and tender, and made unnatural growth; the consequence was, that in the severe winter of 1860 and 1861, when 46° of frost were registered, nearly all the Conifers were destroyed, only one of Hartweg's collection being left—that was *Pinus Benhamiana*, of which we have now two grand specimens; but the cold had no effect on *Abies nobilis*, neither had the summers up to that time. The trees were quite stunted, the rate of growth being at about an inch in the season, and the shape that of a branch about 4 feet high. At last, the tree becoming quite an annoyance, I had orders to destroy it, and in taking it up I discovered that the plant had been grafted on a weak stock—*Abies Frazeri*—and a collar was about the graft four times the size of the stock. I cut four pieces of bark from the swollen part of the graft, and replanted the tree, but this time 6 inches deeper, well ramming the soil in round the union. It threw out roots quickly from the graft where the bark had been removed, and in two years it had made a strong leading shoot, and grew away with great rapidity, as the present height (56 feet) and stem (6½ feet round at 1 foot from the ground) prove. As the position was one exposed to the north-west winds, the roots have been weighted on three different occasions with about 20 tons of soil, so that the tree stands on a mound, and its appearance is much improved in consequence. Other grafted Conifers here have been treated in the same way, with similarly successful results.

PTERIS TREMULA.

ALTHOUGH one of the most useful Ferns for decorative purposes, and one that is extensively grown for market work, this is considered of little value by those who grow collections of Ferns. In most private establishments it is treated more as a weed than as a plant that is worthy of better culture, and consequently it is not seen in its best form. When once introduced into an establishment, and fertile fronds are developed, the spores will float about, and eventually seedlings will spring up in any genial position; but when species are sown in the ordinary way, it is often difficult to get a good batch of plants, for, being very fleshy and tender, they are liable to damp off when crowded together, as they invariably are, even when the greatest care is taken to avoid sowing the spores too thickly.

It is perhaps on account of its being so often seen in an unsatisfactory condition, that it meets with so little favour. When plants are left to take care of themselves they soon get drawn and leggy, especially if crowded up together in a warm position; but pot the plants in fairly good soil, give them plenty of room, and an intermediate temperature, with water as they require it, and good plants may be obtained in a very short time. When a little extra care is bestowed upon them, very elegant plants, which for decorative work cannot be surpassed, will be the result. Old plants, after they get a little shabby, should be discarded, to make room for young ones, a batch of which should always be coming on for succession. There are several very distinct forms of *Pteris tremula*, but it is not until recently that any of the varieties have been considered worthy of distinction. The form which I was acquainted with some fifteen years ago (of which I had dried specimens) was widely different from that usually grown for market work at the present time. Where large numbers of seedlings are grown variations will frequently occur. The variety selected by Messrs. Veitch & Sons, and named *P. tremula foliosa*, is one of the best forms I have seen. In this variety the stipes are short, the fronds broad and spreading, the pinnales close and much broader than in the normal type. *P. tremula flaccida* (May), is another very distinct variety; in this the fronds are longer, the terminal pinnales being much elongated; the lower pinnales of the side pinnae are also more extended and slightly twisted, giving the fronds a beautiful undulating appearance. First-class Certificates have been awarded for both of the above varieties. Crested forms occasionally make their appearance, but they are not very constant. *P. tremula grandiceps* is the most distinctly crested form. *Pteris.*

NURSERY NOTES.

W. ICETON'S, PUTNEY PARK LANE.

THIS nursery is situated close to the Barnes end of the Lane, very near Barnes station on the London and South-Western Railway. The speciality of this nursery consists of Palms, of which there is a very large stock of various sizes, from small seedlings in thumbs up to fair sized specimen plants. Two good samples of *Kentia Forsteriana*—probably the most useful of all Palms for decorative purposes—average about 18 feet in height—a decent size. But it is of the smaller sized plants that the stock consists—Mr. Icton having had this last season 70,000 of this useful species. *Cocos Weddelliana* is largely cultivated, and so also is the true *Phoenix rupicola*, which is a very handsome Palm, and of which Mr. Icton has a nice healthy lot. A noticeable Palm is *Areca Sanderi*, which is remarkable on account of the whitish nerves of the leaves and red colour of the petioles; it is distinct, and will probably find many admirers; only small plants of it were to be seen here. *Areca lutescens*, *Lantania borbonica*, and other popular sorts are also grown. Other plants besides Palms also find room here, and next in importance are the *Dracænas*, of which *D.*

Lindeni, with the pale golden-yellow variegation, is the most attractive; it makes a first-rate furnishing plant. *D. australis* and *Cordyline brasiliensis* are both represented by good plants in fine condition. Other *Dracenas* are *D. linearis*, *D. Danielli*, &c., both good kinds. Before quitting the foliage plants mention has to be made of *Ficus elastica*, which is grown as far as possible on the Continental system, being planted out in pits, and thus gaining the rich bronzy hue which so enhances its beauty. A large space is devoted to the decorative *Asparagus plumosus*, which is raised from seed saved in the nursery, the demand for the "foliage" of this plant is ever on the increase in the market.

who can make it convenient to visit the nursery. The sprays gracefully arch over, and present the upturned faces of the flowers, ranged in two rows, with the greatest precision; the well-rounded petals, the curiously curved spurs, the delicately sulphur-tinted white flowers, with a shade of sky-blue near the column, are all well shown up by the dark green of the plants. A spike or two with a piece of Maidenhair Fern could leave nothing to be desired as a spray for evening wear.

Angraecum dependens.—This is also in bloom in good quantity for the first time; it is a robust grower and very profuse flowerer, and so also are the rare *A. fastuosum* and *A. polystachyum*, the

dered distinguishable by name) should be mentioned, as they are the best which have yet appeared in their sections. The one has the general features of *C. T. Backhousiana*, and has a similar dark tip to the delicate lavender petals, but the glowing purplish-crimson of the front portion of the labellum is still further intensified by the rich orange throat, and the blending of the two colours where they merge into each other. The other is of the delicate tint of that known as *C. T. delicata*, but is a perfectly-shaped, neat florist's flower, the slightly rose colour of the labellum being clearly displayed, the habit of the whole plant and flowerspike is erect, and the parts of the flower are exquisitely arranged.

The two large houses of *Phalaenopsis* are now well over the fog difficulties, and are displaying bloom profusely, the pretty and fragrant *P. Schilleriana* supplying the bulk of it, though *P. amabilis*, *P. Stuartiana*, and others, are plentiful, and with them are some flowers of *P. Sanderiana*, and the new and curious *P. denticulata*.

The *Cypripediums* now are a great feature here. Five new houses have been built for them and filled, and now this genus alone occupies as much space under glass here as some nurseries can give to the whole of their stock. Many thousands of the new *C. Sanderianum* are here, and as many of them have been in flower, all others available have been crossed with it, and so there are "great expectations." Certainly an examination of the quaint beauties of the flowers now open seems to say that its hybrid progeny would produce some wonderful things. Many of the other *Cypripediums* are in flower or bud, and among those expanded are *C. Haynaldianum*, *C. Lawrenceanum*, and others in quantity.

The *Odontoglossums* are in equally great force, and a grand strain of *O. crispum* give their attractive flowers to the houses, as well as good supplies of bloom on *O. luteo-purpureum*, *sceptrum*, *Pescatorei* (out of which some fine *O. excellens* have flowered), *blandum*, *mirandum*, *pulchellum majus*, &c.; and in a warmer house a lot of *O. Roezlii* is in bloom, about which a curious fact is noted. The varieties with red or crimson in them smell like Roses, but that called *alba*, having no colour, except a yellow tint on the labellum, has exactly the odour of Lily of the Valley.

Among the other Orchids in bloom at the Clapton Nurseries, are in more or less quantity, *Coclogne cristata*, *Lycaste Skinneri*, *L. plana*, *Dendrobium Fitchianum*, *D. Wardianum*, *D. heterocarpum*, *D. crassinode*, several of a new strain of *D. lituiflorum*, with nearly white sepals and petals; *D. fimbriatum oculatum*, *D. Brymerianum*, a grand lot of high coloured imported *D. nobile*, some *Zygopetalums*, and *Oncidiums*, and a pretty and presumably new *Restrepia*, with brownish-crimson lines on golden-yellow instead of the spots usually seen in that section of the genus. *J. O'Brien*.

FOREIGN CORRESPONDENCE.

BERLIN.

SINCE my last letter on the Berlin flower shops the display in them has somewhat altered. Hyacinths in the finest white and rose varieties are much in request, as well as yellow ones; the darker sorts are, however, seldom to be found—preference is given here to the tender tints of varieties of Hyacinths as well as of other forced flowers. White and light blue *Syringas* are in almost every shop; *Galaanthus* and *Myosotis* are still scarce, but in great request. A delightful arrangement—a basket in Mr. Maus's establishment—has attracted the attention of every spectator. The large dark brown basket was filled with moss, in which were placed a great many twigs of *Salix*, with dark reddish-brown bark and rose-coloured catkins, interspersed with rose Hyacinths and rose *Anemones* and long tender shoots of a very small leaved dark variety of *Ivy*, with bright greenish-white nerves. The handle was dressed with a bouquet of rose Hyacinth with dark brown leaves of *Mahonia*. This basket was so much admired that some days after

FIG. 38.—*ABIES NOBILIS* AT TUORPE FERROW. (SEE P. 236)

Of plants in flower there are but few comparatively forced—Lily of the Valley, largely grown and in a capital manner, formed the chief; Hyacinths and Tulips following in less quantities, and a bright relief was seen in the house devoted to Ghent Azaleas, which were masses of rich bloom.

ORCHIDS AT MESSRS. HUGH LOW & CO.'S.

Angraecum citratum—This charming Orchid, represented by the largest quantity ever seen together, and bearing over 2000 of its neat and elegantly arranged sprays of flowers, forms the chief attraction of the Clapton Nurseries at the present time. The beauty of the display is altogether beyond description, and an opportunity to witness such a sight should not be allowed to pass by any lovers of flowers

latter having sprays of white flowers with curious convolute lips, and exhaling a fragrance like that of *Pilumna fragrans*. A very large quantity of the fine *A. sesquipedale* has a few of the spring-flowering variety coming into bloom, and some new species are sending out spikes which it is to be hoped they will bring to perfection.

Cattleyas.—Many houses are devoted to these, one of them alone containing some 8000 plants; but in the matter of flowering the varieties of *Trianae* have it now nearly all to themselves. The strain throughout is of the best, and in one little batch, with flowers of excellent shape, the colour of the glowing lipped *C. T. Osmani* is closely imitated—a very rare thing in any importation of *C. Trianae*; two specially distinct things (which it is to be hoped will be ren-

similar arrangements might be seen in a great many other flower-shops. Very nice were those variations with dark-red Anemones. Violets are still in great quantities; Lilies of the Valley less so. Much appreciated and almost in every flower-shop, are now two plants, in former years rarely seen—*Amaryllis* and *Acacia*. Of the first you find everywhere large bundles of flowers. The yellow flower-twigs of the second are to be found in a great many of the bouquets sold in the streets by the flower women. Tulips and Daffodils in fine specimens everywhere, *Cyclamen* and *Roses* now seldom. D.

VARACH SEEDS AND CRABOO FRUITS.

Under the name of Varach seeds and Varach candles there were exhibited in the Gambia Court at the Colonial and Indian Exhibition in 1886 some flattened roundish seeds strung upon a piece of Sorghum stalk, each about a foot long. The information given with these very primitive candles was that in some parts of the interior, where the plant grows, the natives use the seeds sometimes as candles, by threading them closely together, so that when burning they catch fire slowly one after another—one of the so-called candles above described giving an uninterrupted light for nearly an hour and a half. None of the seeds in the specimens exhibited were perfect, being either broken or partially destroyed by insects, so that it was impossible to identify them botanically. Since then, however fresh material received at Kew has proved the seeds to be those of the Coco Plum (*Chrysobalanus Icaco*), so that it would seem that the seeds of this plant contain sufficient oil to enable it to burn readily.

Craboo fruits were exhibited in the British Honduras Court of the before-mentioned Exhibition, and were described as a small acid fruit, in size between a black Currant and Gooseberry, which, when sweetened, makes a pleasant wholesome drink. In Morris' *Colony of British Honduras*, p. 56, the Craboo is thus referred to:—"Another common 'Pine ridge' plant in the South is the 'Craboe,' which yield a kind of Plum or Cherry, sometimes used for food, and whose bark is used for tanning." The fruits exhibited at the Colonial Exhibition were procured for the Museum at Kew, and upon examination proved to be those of *Byrsonima spicata*.

VENTILATION.

CONSIDERABLE additions, at an estimated cost of about £40,000, are being made at Etcoo College, from the designs of Arthur W. Blomfield, Esq., M.A., architect, who has entrusted the warming and ventilating arrangements to J. Weeks & Co., Chelsea.

The buildings are to be warmed by means of patent hydro-caloric warming and ventilating coils, which admit, into each apartment a continuous stream of fresh warm air, either perfectly dry or charged with an agreeable amount of humidity, at pleasure. As these coils have been largely used by the Government and in many public buildings, their principle of inlet is pretty well understood; our readers will, we think, be more especially interested in their method of purifying the rooms, by extracting the vitiated air, as this is a matter of great sanitary importance, not only to those whose houses are warmed by means of a hot-water apparatus, but also to those who cannot afford that luxury.

The apparatus consists of properly constructed air ducts, next the ceiling of the various passages, commencing at the extremities of the buildings and converging to one large vertical shaft, situated, in this instance, about the centre of the building. The warm vitiated air from the upper part of each room is passed into one or other of these air ducts by means of ventilators specially constructed for the prevention of down-draught. This influx of hot air naturally renders the ducts warm throughout, and serves to create a continuous and steady exhaust from each of the compartments. But to render this exhaust

assured, and of various degrees of potency—for it can be regulated to a nicety—the upright shaft is fitted with a powerful extractor, consisting of a series of gas-jets, which when lighted increase and confirm the tendency which the rarified air already possesses to pass out of the rooms and discharges it with considerable velocity above the roof without the possibility of any back-draught. The capability of this system of ventilation may be judged from the fact, that it effects a complete change of the air in the various rooms at least twice within the hour, and that without opening any doors or windows.

Another valuable feature of this system is its adaptability for summer as well as winter use. During the former season the heated air can be continuously drawn off, and cool fresh air passed into the rooms without discomfort or trouble, as the apparatus, when once set going, is self-acting.

FORESTRY.

USES OF COAL-TAR IN FORESTRY.

COAL-TAR, an almost waste product of gasworks, has remarkable preservative properties when applied either to dead or living wood, but unfortunately its great value in this particular way is but little understood. True it is that for painting wood and iron fences coal-tar is greatly in request; but what we particularly wish to draw attention to at present is the great value it possesses for coating over freshly amputated branches, and wounds caused by trunk cavities, loosened bark, or branches riven off during high winds. Trees that have been neglected for a number of years are frequently to be seen with their holes seriously injured by cavities, caused, it may be, by the decay of dead or broken branches, effects of lightning, or carelessness on the part of those who are entrusted with the charge of horses in the woodlands. These evils can, perhaps, not be cured, but they may certainly be minimised, and in many instances the progress of disease may be arrested by careful pruning away of all dead wood, making the edges of the wounds as smooth as possible, and applying a coating of tar to the surface. Without penetrating deeper than ordinary paint coal-tar forms an impervious coating to the wood-cells, and thus causes water to run off and wards away decay. Bark that becomes loosened from whatever cause can never again attach itself to the trunk, although more than once we have noted those who were ignorant of the fact nailing it on under the impression that it would again become united. Where loosened bark is present on the stem of any tree the best way is at once to have it carefully removed, the edges neatly rounded off with a sharp pruning knife, and the whole coated over with tar.

Some of the attending evils of loosened bark are that it prevents the circulation of sap, and forms a snug retreat and breeding ground for numerous insects that are injurious to tree life. The odour of the coal-tar soon drives away all insects that may be present on the stem, and by its complete adherence to the wood prevents others from settling thereon. No injurious effect has been noted in connection with the application of coal-tar to forest trees generally, but instances have come under our own notice, and have also been reported from the Continent, in which stone fruit trees, particularly the Plum, have suffered severely from an application of this tar. The Apple and Pear show no bad effects, even from several applications, and we have treated large specimens of the Plum and Cherry with perfect success, while young trees of the latter have been all but killed by a single application. Where the bark is young and tender the tar should be applied with caution, and never, if possible, wholly around the stem of the tree or shrub requiring treatment.

Coal or gas-tar is of great value to the forester in another way, for by dabbing the outer branches or stem (or even small stakes inserted in the ground alongside) of any plant with which ground game interfere, it will immediately and for some time put a stop to such depredations. We have found it to be a good and safe plan to stick a few pieces of branches around the plant requiring protection, and dab these over with tar at intervals of time varying from one to two months, according to the state of the weather. Both hares and rabbits have a great aversion to the smell and taste of coal-tar.

To applying tar, whether it be to living or dead wood, it is advisable to use it in as thin a state as possible, and to insure this the easiest method is to boil or heat the tar just before it is wanted for use. Tar in a hot state may with great benefit be applied to fences or dead wood, but it is highly injurious to coat either bark or living wood with it when partially heated. When tarring fences it may be well to inform the inexperienced in such matters that just at the ground surface, or where earth and air meet, decay in the wood soonest sets in; therefore, to counteract this as much as possible the tar should be applied well down to the ground level, all surface herbage having been previously removed to facilitate the operation. A. D. Webster.

DURABILITY OF SILVER FIR AS RAILWAY SLEEPERS.—With a view to test the durability of the above wood as railway sleepers, compared with Baltic Pine ones, I made the following experiment:—On April 17, 1877, I had four Silver Fir sleepers laid beside new Baltic Pine ones, on the Caledonian Railway line four miles north of Perth. On June 21, 1884, one of the four Fir sleepers was raised for the purpose of exhibiting it at the Forestry Exhibition held at Edinburgh. Although it had been seven years and two months in use, it was in a remarkably good state of preservation, whereas many of its Baltic Pine companions had been thrown out after being but six years in use. In August last, 1887, when renewing sleepers on the line, two of the remaining three Silver Fir ones were thrown out, the fourth being considered still fit to retain its original bed. As the success of my experiment seemed fairly satisfactory, I consider the result obtained worthy of all publicity, for when it is remembered that the average duration of Larch sleepers is about eight years, it cannot but be regarded as noteworthy that those of the wood experimented on should have attained a duration of ten years and four months before being thrown out. But durability is not the only point in which the Silver Fir is equal to the Larch, for it luxuriates and produces sound timber on soils that will affect injuriously the Larch with dry rot, which deteriorates so much the ultimate value of Larch.

I do not know any coniferous tree (Douglas Fir excepted) that equals the Silver Fir in producing bulk of timber per acre, for after reaching its fiftieth year it outstrips all other Conifers in size. In planting this tree great attention should be given to the selection of favourable sites for its growth. Humid situations should be avoided. Upon estates where my advice has been asked, I invariably recommend to plant Silver Fir on snitabile sites for the permanent crop, at about 14 feet apart, filling the intervals with Larch only at 4 feet apart. When this mode of planting with Silver and Larch has been adopted, if at an early stage of their growth, the trees intended for the ultimate crop give indications of becoming healthy, the Larches may be gradually thinned out, and the permanent crop reared purely of Silver Fir; or the plantation may be reared a mixed one; or, should the Silver Fir trees fail to advance satisfactorily, the plantation may be converted into a pure crop of Larch. *Wm. McCorquodale, Jeanie Bank, Perth, January 26, in the "Perthshire Constitutional."*

ADMINISTRATION REPORTS OF THE FOREST DEPARTMENT, MADRAS, 1885-86.—A copy of this bulky publication has lately reached us. The work of the year mainly consisted in the selection and reservation of the land that is to form the permanent forest area of the Presidency. Mahogany and ceera-rubber are likely to do well, Encalypts are a failure on the plains, Manilla Hemp and the Date Palm promise well in the southern districts, Ipecacuanha plants are in a promising condition at Nilambur, while Maples and Conifers are doing well on the Nilgiris.

PLANTS AND THEIR CULTURE.

CALATHEAS (MARANTAS).—Few plants show signs of distress sooner or more plainly than these; and when this arises from the exhaustion of the fertile ingredients of the soil, their leaves not only get smaller, but are very apt to take on a singed-like appearance round their edges. *C. Veitchii* is very sensitive in this respect, and seeing that the ornamental value of the plants depends on their foliage, the cause of this should, if possible, be avoided, and an abundance of clean, well-developed growths aimed at. To secure this result it is advisable to report the plants

annually, employing a porous soil, such as rough fibry lumps of peat or loam, with large pieces of charcoal, and sandstone or brick rubbish broken up rather finely. A good portion of sharp sand, and a little dry powdered cow-dung may be added to the above. This compost suits equally *Alocasias*, *Schismato glottis*, *Drymonias*, *Curmerias*, the dwarfier growing *Hoffmannias*, and many of the *Anthuriums*, such as *Andreanum*, *Scherzerianum*, *Veitchii*, and *Warocqueanum*; but for the stronger growing *Anthuriums*, like *magnificum*, *ornatum*, *crystallinum*, and *aculea*, loam may replace the peat with advantage. The last-named *Anthurium* is by far too seldom met with: it is a noble foliaged plant with green leathery leaves a yard or more long, and a foot broad; the spadix is upwards of one foot long, has a Violet scent and colour, and is followed by white fruits. All these plants enjoy a high temperature and moist surroundings, but the *Calathas* are extremely sensitive to sudden fluctuations, and are much injured by being placed in a draught; and they dislike full exposure to the sun. If peat of the best light fibry kind be not at hand, some finely chopped sphagnum may be used instead of it; and in the case of *Anthuriums*, tufts of fresh sphagnum inserted between the fibry lumps on the surface of the pots are beneficial. Give plenty of water at the roots, but avoid letting the soil become soured from over-watering.

Franscescas.—These plants will now be on the move, and should be encouraged either by potting, top-dressing, or with liquid manure. A light loamy soil suits them best, as in it the growth is sturdy and floriferous: the wood also ripens well, and does not require so much pruning back as is the case when peat or leaf-mould is used. They are cool stove plants, delighting in plenty of light and air, with copious syringing during the growing season. Cuttings of the half-ripened wood inserted singly in sandy soil in small pots and placed in a propagating frame will be well rooted in a month, when by potting them on and growing in brisk heat, with once or twice pinching, they will make handsome little decorative plants within the year; but the wood must be well ripened to secure this result, by giving plenty of warm dry air towards the end of August and during September. They may afterwards be kept cooler until it is desired to start them. There are many varieties, but the well known *F. calycina*, its large-flowered variety, *F. c. major*, and *Lindeniana*, are the best—*acuminata*, *confertiflora*, and *eximia* being added for variety.

The Forcing Department will require attention in order that the supply may be kept up. A great many hardy flowering shrubs will now be easily excited into bloom, viz., *Rhododendrons*, *Lilacs*, and *Azaleas* of the Ghent or mollis type. Of *Deutzias* the double-flowered *D. crenata flore-pleno* should now be started, as well as a first batch of *D. gracilis*; *Prunus* of sorts—especially the newer *P. Pisardi*—are very effective plants when forced. A number of the *Gueldres Rose* put in now would flower in time for the Easter decorations, when the large white flower-heads are much appreciated. Syringe them freely, and maintain a temperature of about 60°, and they will come on quite as fast with this temperature as a higher one, unless it be that the rise is occasioned by sun-heat. Look over the various bulbs, and see that they are not becoming drawn. Place fresh relays of them in heat according to demand; but very little heat will be required in most cases—ordinary greenhouse temperature being sufficient. Mere protection from frost will greatly forward these plants, and in most cases will be all that is required to bring on *Narcissus*, *Scillas*, *Crocuses*, *Hyacinths*, *Anemones*, and *Ranunculus*; *Astilbe japonica* and *Lily of the Valley* should be placed in the forcing-house. Neatly stake, and give manure to all forced plants that may require these aids. *Indian Azaleas*, such as the old white, *Borsig*, *Deutsche Perle*, and *punctulata*, are easily induced to open their flower-buds; but in forcing this species it is not desirable that they should also produce young leaves with the flowers, as this rather tends to spoil the plants and mars the effect. To prevent this as much as possible it is better not to wet the foliage more than can be helped, and give only just sufficient water to enable them to expand their flowers. Forced plants which have flowered and are now making their growth, should receive encouragement until it is completed; they will come in useful for starting at an early period next season. See that such plants as *Gesnera cinnabarina*, *G. refulgens*, *Poinsettias*, and *Tydeas*, which have gone out of flower, are carefully watered, and the foliage preserved in health until it has performed all its

functions; for on the attainment of this, their progress next season will in a great measure depend. *F. Ross, Pendell Court, Bletchingley.*

THE ORCHID HOUSES.

SHADING.—The sun's increasing ardour will remind us that the shading for the houses must be overhauled to ascertain what is required for the season. The south side of the cool *Odontoglossum*-houses that run east and west must be shaded for an hour or two in the middle of the day if bright, or the foliage of the plants will not keep of a fresh green tint. I am of the opinion that they will bloom quite as well and produce finer flowers for a season or two when the sun is allowed to shine upon them sufficiently to make them of a reddish-brown appearance, but the plants will not retain their foliage so long, and which make it appear that the plants are not doing so well as under shade. Once over the middle of February I find it is better to shade a little on bright days rather than to give ventilation sufficient to keep down the temperature, especially while cold winds prevail. The East Indian-house is best shaded with some light material at first, the heavy summer shading making the house too dark and cool. Sun-heat is very beneficial to these species of Orchids, but the tender foliage of many of them cannot bear with impunity the direct rays of the sun passing through glass. *Cattleyas* will enjoy a fair amount of sunshine provided the floors are damped often and the ventilators kept open. Sunny weather is good for *Cattleyas* when forming their flower-buds, causing them to expand to a larger size, and the colourings to be richer; but the flowers fade soon if not shaded from too bright sunshine.

Repotting Vandas.—The months of February and October consider to be the best time for an examination of the *Vandas*; some plants will require only top-dressing, whilst others will be better for being plunged, pot and all, into a larger one, first picking out all the old moss, and filling up with large new crocks near to the rim; others that have lost their lower leaves will have to be set lower in the pot by cutting away a portion of the stem, but leaving sufficient roots to sustain the plants; those that have not yet rooted near enough to the bottom foliage to make shapeable plants when cut down, should be encouraged to do so by syringing the bare stems daily. All *Vandas* that have been disturbed at the root will right themselves quickly if the atmosphere be kept moist and a little warmer than that of the *Cattleya*-house.

Dendrobiums that have their flower-buds well advanced will open much larger if placed near the light in a moist, warm house, such as the East Indian-house. *D. Findleyanum* we grow suspended in the East Indian-house all the year round.

Pachystoma Thomsonianum is starting to grow in the warm house, and will require now watering oftener. Give a little air to all the houses on mild days, as early in the morning as the temperature of the houses will permit; close the warm houses early in the afternoon of bright days, so as to secure a portion of the sun's heat. *C. Woolford, Downside, Leatherhead.*

THE FLOWER GARDEN.

LAWNS.—Frost and snow will have delayed all turfing operations, but these should, on the first favourable opportunity, be completed without delay. In filling up and levelling eschew rich soil, if a patchy appearance is to be avoided. In the making of lawns, tennis-courts, &c., drainage is one of the first points to be considered, and cannot be overrated, but is the preliminary to all other work. After draining and levelling operations, next in importance is the surface soil; this should be dug over a spit deep, and if poor it should be afforded a dressing of rich manure, to be dug in as the work proceeds, and let the digging be done roughly, so that the soil may get pulverised by frost and wind. Prior to sowing the seed, in the first week in April, the surface should be brought into a suitable condition by levelling, raking, and rolling, treading it down firmly, and clearing away stones and rubbish. In cases where the soil is of poor quality a covering several inches thick of good loam should be added, if the best

results are looked for. In ordering of the nurseryman it is advisable to state the character of the soil, so that a suitable mixture may be sent. Choose a calm day for sowing, going over the ground twice, crossing and recrossing at right angles, so as to ensure everywhere an even plant; after sowing rake over the surface, and roll in with a wooden roller. After-management for the remainder of the season will consist chiefly of mowing with the scythe, picking out any weeds that may appear, and frequently rolling in showery weather, and immediately after each cutting. [Many persons prefer to sow the Clovers and larger grass seeds first, lightly hoeing these in before sowing the finer seeds, which are then merely raked in with a wooden rake, or one that will not penetrate the ground so deeply as to disturb the first sown. Walking over the ground after sowing with short boards fixed to the feet is better than rolling. Ed.]

Walks and Carriage Drives.—Grass edgings should be cut with the edging iron, and put in order as soon as practicable, rolling the grass previous to doing so, and afterwards the gravel, when dry enough. *J. Horsefield, Heytesbury.*

FRUITS UNDER GLASS.

PITS AND HOUSES.—*Melons.*—Regulate the growth of Melons, and when the shoots have reached the top of the trellis they should be stopped. Attend to the fertilising of the flowers as they appear, endeavouring to set about six or eight at one time, so that they may grow with uniformity. Be careful in applying water at the root at this early season, and maintain a steady temperature of 65°—70° at night, admitting a little air daily. A successional batch of plants should be started, as formerly directed.

Cucumbers.—With more light and sun-heat a greater amount of moisture may be given, and a rich top-dressing should be placed over the roots whenever these appear on the surface; this is preferable to placing a large quantity of soil around them all at once. Those Cucumbers put out on mounds at an early period of last month should now be growing freely, and when the shoots have reached the top of the lights the points must be pinched and the lateral shoots stopped at each joint as they continue to grow. A hotbed may now be got ready out-of-doors, and any approved varieties planted in it when ready. The material of which the bed is to be constructed should consist of leaves and stable litter in equal parts; this should be mixed and thrown into a loose, conical heap, and turned two or three times prior to making up the bed; in the meantime let the frame be well cleaned and, if necessary, painted. *Wm. M. Baillie, Luton Hoo.*

THE HARDY FRUIT GARDEN.

STRAWBERRIES.—The plants set out last autumn will require to be looked over, as numbers of them will be found to be lifted out of the ground by frost; and as soon as the ground is sufficiently dry to tread upon, the soil may be trodden around the plants, lightly hoed, and the weeds raked off. Then give a thick mulch of long stable-manure between the rows, placing it neatly round the plants with the hand. The rains will carry the manurial properties out of the mulch down to the roots, and the surface will have a clean appearance. Older plantations which have not yet received a dressing of manure should be attended to, and long stable-straw be strewn thinly on the surface to keep the fruits clean.

Miscellaneous.—During bad weather an opportunity will be afforded for the relabelling of those fruit trees which may require it, and a list of the names should be prepared accordingly. The labels must be well cleaned and painted afresh, and after drying the names may be either written or printed thereon. Here we use stencil plates and Indian ink for the purpose of printing the names on the fruit tree labels, and the work is quickly and easily performed by their use. After the ink is dry, the labels receive two coats of clear varnish, and the names will then be legible for several years. The fruit in the fruit-room will require frequent attention. I find that late varieties of Apples are keeping well; but Pears are finished with the exception of *Bergamotte d'Espereu*. *A. Ward, Stoke Edith Gardens, Hereford.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETING.

THURSDAY, MAR. 1—Linnean Society.

SALES.

ORCHIDS	at Protheroe & Morris' Rooms.
TUESDAY, FEB. 28.	Azaleas, Camellias, Roses, and Shrubs, at the City Auction Rooms, by Messrs. Protheroe & Morris.
WEDNESDAY, FEB. 29.	Roses, Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.
	Lilium auratum, Palm Seeds, Roses, and other Bulbs, and Plants, and First Sale of Nursery Stock (from sample), at Protheroe & Morris' Rooms.
THURSDAY, MAR. 1.	Established and Imported Orchids, 10,000 Lilium auratum, at Stevens' Rooms.
FRIDAY, MAR. 2.	3000 Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, MAR. 3.	Roses, Bulbs, &c., at Protheroe & Morris' Rooms.

The late ex-Curator, Royal Gardens, Kew. IN our last issue we made mention of the claims upon the respect of the gardening community that this venerable Nestor possessed. His example is an encouraging one to young gardeners. Beginning in the very lowest ranks, with the slenderest means, and enduring hardships few are now called on to bear, he eventually became Curator of the Royal Gardens, Kew, whose present condition is in no small degree due to his initiative, and, moreover, obtained a good place as a botanist.

In spite of the weight of ninety years—in spite of the total deprivation of sight—the veteran persevered to the last, and retained to the end his interest in gardening and botany, while his richly stored memory did not appear to be impaired by his many years. The letter we append was dated February 10, only two days before his death, and was addressed to the present Director in reference to the Garden Library:—

“Park House, Kew.

“DEAR SIR,—The books are tied up ready to go to the library if you will kindly direct some one to fetch them, as I have no one to send.

“I am very glad to learn that the library is in a flourishing state. I call it now my grown-up child. When I came to Kew I had three books, and was therefore considered a great man. In time my books increased, and I used to lend them to the men

most inclined to learn, and explain to them the parts of plants; this went on for a number of years. Under the auspices of Sir W. HOOKER money was granted for founding the men's library. The books were for some time kept in my house, and I took great interest in and framed rules for their use, which Sir W. HOOKER sanctioned, and which I continued to take interest in till the time of my retirement.

“Believe me, yours, very truly,
(Signed) “JOHN SMITH.”

The funeral took place on Saturday last in Kew churchyard. There, where also repose several members of his family, the ex-Curator lies, associated in death, as in life, with the Directors—AITON and Sir W. HOOKER—under whom he worked and to whom he rendered such distinguished service. It was fitting that the late Director—Sir JOSEPH HOOKER—and the whole staff of the garden and herbarium, were present to testify their respect to a former colleague, and to the man who helped so materially to make Kew what it now is.

The action of frost on seedlings. HERR L. KNY * has been making experiments to determine whether the action of frost on seeds influences the development of the seedlings produced from them.

In cold climates the annual period of growth is shortened, as it were, the season during which the plant must vegetate is condensed, and the shoots and flowers have to unfold rapidly, in order to “make hay while the sun shines.” This is very marked in the Alps, where the green covering of the hills makes its appearance with astonishing rapidity; and in the extreme North we have the Willows flowering directly the sun's rays fall on them, weeks before the ground is fully thawed. Again, showing how vegetation has to hurry up in the Alps, the flowers of Parnassia, Gnaphalium dioicum, Gentiana germanica, Solidago, Dianthus superbus, come out a month sooner in the high mountains than they do lower down, otherwise they could not ripen their seeds.

The question arises, Is this hurried development favoured by the long intense cold to which the seeds are subject? Several experiments seem to point to this conclusion, and various observers—KNIGHT, KRASAN, FRANK, &c.—have found that perennial plants exposed to low temperatures during the winter-rest put forth shoots more rapidly and earlier in the spring than the same plants kept warmer in the winter.

MULLER-THURGAU took ten Potatoes, all alike, and of about the same size and weight; he placed five in an ice-cellar and surrounded them with ice, the other five were kept in an ordinary house-cellar. Those exposed to the freezing process yielded a large crop in three months after planting, while the others, planted at the same time and in exactly the same way, soil, &c., had as yet only begun to show shoots, and bore no tubers. It is important to notice that the exposure to cold increases the amount of sugar in the tubers, i.e., of food directly available in growth, &c.; whether this is also connected (as SACHS has suggested) with a greater secretion of ferments in the same must remain a question.

The author discusses other instances, and points out that, in cases of acclimatisation, it has not yet been decided whether an inherited disposition to hurry the vegetative processes is established, or whether the immediate action of the low temperature is manifested. Some experiments by HABERLANDT, who used Mustard, Flax,

* Sitzungsberichte der Gesellsch. naturforsch. Freunde zu Berlin, November 15, 1887.

Maize, Wheat, Rye, Peas, &c., seem to point to the latter conclusion being correct for the Flax and Mustard seeds.

The author used Beans, Lupins, Peas, Clover, Tobacco, Barley, &c., and obtained negative results. Consequently he does not decide the question, but he comes to the conclusion that the action of frost on seeds varies in different species subjected to the same treatment, and varies with the treatment otherwise, e.g., whether the seeds are swollen or not before the frost acts. It is desirable that experiments should be carefully conducted on a large scale to test—(1), How the seedlings of different plants behave after the seeds have been exposed to frost, as compared with those from similar seeds not so exposed; (2), the influence of exposure to different degrees of temperature; (3), the influence of the time of exposure in each case; (4), whether it is important or not how long after ripening the exposure to frost commences; (5), comparisons of effects of freezing swollen and dry seeds; and so forth. It is extremely probable that an important physiological and agricultural question might be solved if such experiments were thoroughly carried out by competent botanists, aided by foresters, horticulturists, and agriculturists; in any case the results would be of great interest.

THE ROYAL HORTICULTURAL SOCIETY.—We understand that the Rev. Mr. WILKS has undertaken the duties of Hon. Secretary. The clergy generally have not a reputation for being good men of business, but in this case a man of wide views, clear head, and business capacity, has been appointed. A paid Assistant-Secretary is to be appointed, at a moderate salary. The real requirement, however, is that of a first-class man, like the manager of a railway, with a corresponding salary. As the finances do not permit this, the Society must needs do without such an officer. An ornamental official, at a low salary, will probably be as useless as his predecessors generally.

THE COUNCIL.—Two vacancies have been caused on the Council by the resignation of Messrs. LEE and COURTAULD, who, in the interests of the Society, have tendered their resignations. Their places are filled by Mr. WOODBRIDGE, a practical gardener, and Mr. HAYWOOD, the Treasurer of the National Rose Society. By these changes half the Council is renewed. The self-abnegation of the two gentlemen above mentioned will meet with the cordial recognition of the Fellows.

THE SUBSCRIPTION RATE.—We believe it is proposed that in future the subscription shall be £4 4s., £2 2s., and £1 1s. respectively, with corresponding privileges, but with only a single vote in each case. It is proposed also to establish a grade of Associate at an annual subscription of 10s. 6d., comprising personal admission to all meetings and shows, but without the privilege of voting. The associateship is to be confined to *bona fide* gardeners of good repute in their craft, and who shall be recommended by not less than two personal acquaintances. Hereafter it is hoped that a still more honourable grade may be established by means of the examination of candidates, the successful ones among whom shall be entitled to honorary rank, but this detail must be postponed for the present.

COUNTY REPRESENTATIVES.—The Council and committee will do well to nominate without delay in every county of the three kingdoms one or more gentlemen interested in horticulture as local representatives (or what other title may be preferred). Some, no doubt, would do no work, but others interested in horticulture would do good in their several localities, and form a much-needed link between the London contingent and their brethren in the provinces.

LAPAGERIA HOI SE. WORSOP. MANOR.

ALLOTA PURPUREA. NASH COURT.

LOCAL SECRETARIES.—We press upon the new Council to elect at once certain of the secretaries of the chief local societies already affiliated to the Society as local secretaries, with a seat at least on the general committee. The proposed new rates of subscription ought not in future to preclude anyone with a real interest in the subject.

THE NEW PREMISES.—The offices are well situated and convenient. The Drill Hall is open to considerable objection, but it is convenient of access, close to the offices, is comparatively inexpensive, and may be given up at the end of the year.

CHISWICK.—This will in future constitute the heaviest expense to the Society, and its finances must be rigorously managed. Among the things that can be done at once is to organise at least one show during the course of the summer in the old gardens, and we would suggest that, with a view of making a beginning in the attempt to secure the co-operation of the local societies, overtures be made forthwith to the horticultural societies of Chiswick, Richmond, Putney, and Ealing—indeed, to all the societies within easy reach by rail, for this purpose. It is monstrous that the Society should have allowed a local Society to grow up under its very eyes at Chiswick, and to avail itself for nothing, or next to nothing, of the Society's garden, but there is no reason why the young cutting should not now be removed from the cutting pot and planted out. In following years shows might be organised with the co-operation of the local societies in Croydon, Hampstead, Richmond, and other important suburbs.

THE CITY.—While the site in Victoria Street is well adapted for headquarters, it is to be hoped that no opportunity will be neglected for ensuring one or two meetings annually in the City, where the corn factors and stockbrokers already hold their own shows. The fact that the present Lord Mayor is a Fellow of the Society, Belgian by birth, and therefore a born gardener, and that during his reign it is probable that sundry of our Belgian friends will be invited to the Mansion House, make it very desirable that efforts should be made at once in this direction.

NEW FELLOWS.—Although there has been a very considerable falling off of old Fellows, yet there is a gradual accession of new ones, and it may be confidently expected that when the new policy becomes known, and the Council is seen to be in earnest in carrying it out, as far as time and circumstances permit, that large numbers of new Fellows will be forthcoming. Many, we know, are hanging back till the new subscription rates are fixed.

FUNDS.—The financial position is deplorable, but not hopeless. It will probably form the first matter for consideration by the new Council. The donation fund is proceeding favourably, but this is to be devoted only to the expenses of removal.

ASSETS.—A good deal is said, and rightly so, about the debt of the Society, which, however, has been many times larger in past years, but nothing is said about its assets. We hear, but have no certain knowledge, that there are sundry statues still remaining in the possession of the Society. Surely HER MAJESTY, the donor of some of these statues, could, after her recent message, feel no compunction about the sale of these rather useless works of Art. However excellent they may be, the Society cannot afford to keep them under present circumstances. The Fellows should be made acquainted with the nature and extent of their property—if any.

J. D. DICK.—Great changes unfortunately always injure some one. The removal of the Royal Horticultural Society from its quarters at South Kensington entails upon Mr. Dick the necessity of quitting a residence in which he has made a home for many years. Mr. Dick is a model departmental officer, whose "books" are the admiration of all who consult them, and one who enjoys so thoroughly the esteem of the horticulturists, that it is to be hoped

that the inevitable change may be made as little irksome as circumstances permit.

A BOARD OF AGRICULTURE.—We see with great pleasure that it is proposed to establish a Government department under a responsible Minister. The only drawback is, that in our system of government the exigencies of party directly or indirectly predominate over public interests. It is very important at the present juncture that horticulture should be recognised in the constitution of this new department, for it is obvious that while agricultural methods are no longer adequate to meet the circumstances of the times, the requirements of the case would be very largely met by the introduction of horticulture or of horticultural methods. We earnestly hope that the Royal Horticultural Society, in its reorganisation scheme, will not neglect its obvious duty in this matter. It is more than time that the gardener should be heard, and he could most effectively be heard through a gardeners' society. It is a splendid opportunity for the Society to prove to the public that it is concerned in something beyond the whims and fancies, however laudable, of those who find their recreation in horticulture, and with something more than the interests of those who cater for the supply of the requirements of the *dilettante*. Forestry, market gardening, and fruit culture will occur to every one as great and, up to the present time, little worked departments; but it is to the adoption of horticultural methods, the increase of scientific knowledge of the conditions under which plants grow, of the diseases which affect them, and the enemies that prey on them particularly, that the farmer of the future must trust. When he tills his field as carefully as a gardener makes a Vine border, when he is as careful to secure the right strain of Wheat and Mangel, or what not, as a grower of Chinese Primroses for market—when he avails himself of every resource of the chemist, the botanist, and physiologist, by putting their discoveries to the test of practical experiment before adopting any—there will be hope for the farmer. In the meantime let the Royal Horticultural Society, as becomes its duty, bestir itself in the matter.

BRUSSELS INTERNATIONAL EXHIBITION.—This exhibition will open on May 5. Mr. LEE BARTY, 3, Queen Victoria Street, is the Commissioner for England. English exhibitors may be represented by resident superintendents, so that the personal attendance of the exhibitor is not necessary. Classes 22–24 are devoted to agriculture, horticulture, and forestry.

THE MEANS OF PROTECTION POSSESSED BY PLANTS.—On Tuesday evening, February 21, Mr. F. M. CAMPBELL, F.Z.S., F.L.S., &c., President of the Hertfordshire Natural History Society, delivered the Presidential Address on the above subject at the annual meeting of that Society held at the Free Library, Watford. The different means of protection touched on were as follows:—Protection by means of concealment; protection by means of objectionable flavour; protection by means of objectionable flavours and colours; protection by means of appliances; protection by means of mimicry; protection of seeds and spores. Mr. CAMPBELL gave numerous instances of all these various modes by which plants are protected.

THE LINNEAN SOCIETY OF LONDON.—A meeting will be held on Thursday, March 1, at 8 P.M., when the following papers will be read:—1. "On a New Genus of *Cytinaceae* from Madagascar," by Mr. E. G. BAKER, F.L.S.; 2. "Notes on the Flora and Fauna of the Kermadec Islands," by Mr. J. F. CHEESEMAN.

PERMANENT AND TEMPORARY PASTURES.—We are glad to see that Mr. M. J. SUTTON has brought out a new edition, at a low price, of his very serviceable book on this subject. Mr. SUTTON'S book is one of the best that has been published, being

based almost entirely on practical experiments made from the point of view of the cultivator.

HORTICULTURAL CLUB.—There was a large attendance of members at the annual dinner of the Club on Tuesday, the 14th inst. The chair was occupied by Mr. JOHN LEE, and amongst those present were Dr. Hogg, the Rev. W. Wilkes, Messrs. D. T. Llewellyn, Crowley, H. J. Veitch, Wm. Ball, H. Turner, H. J. Pearson, C. Pearson, H. Herbst, J. S. Consens, C. T. Druery, George Deal, T. Francis Rivers, Geo. Bunyard, Geo. Paul, A. F. Barron, and Geo. Nicholson. The Chairman, in proposing "Success to the Horticultural Club," mentioned that it had been enabled during the past year to offer places of meeting not only to the National Rose Society, but to the Nursery and Seed Trade Protection Society, the National Dahlia Society, the National Anemula and National Carnation and Picotee Societies; and had thus shown its value to the horticultural world in general. The Secretary, in responding, announced that the committee had that day voted a donation to the Gardeners' Orphan Fund, as they had some years ago done to the Gardeners' Benevolent Society. The toast of the "Royal Horticultural Society" was responded to by Mr. H. J. VERRIN, the "Horticultural Press" by Dr. Hogg, and the "Visitors" by Mr. BARRON and Mr. NICHOLSON. Some magnificent bunches of Gros Colmar Grapes were kindly sent by Mr. THOMSON, of Clovenfords, and some beautifully coloured Apples from Mr. RIVERS and Mr. G. BUNYARD; the former also contributing a dish of fine samples of Knight's Monarch Pears. A pleasant and agreeable evening was spent, and many hearty wishes expressed for the prosperity of the Club.

CHAMBRE SYNDICALE OF GHENT.—At a meeting held on the 15th inst. the following awards were made:—

First-class Certificates.—To Mr. A. D'Haene, for *Oncidium splendimum*; to Mr. E. Pynaert, for *Cypripedium Dauthieri marmoratum*; to Mr. J. Hye-Leyssen for *Cattleya Trianae* var., *C. Trianae alba*, *Odontoglossum coronarium*, and *Cypripedium Van Houttei*; to Messrs. Vervaeck & Co., for *Cattleya Trianae* var. No. 1, and for vars. No. 2 and No. 4.

Commendations.—To Mr. A. D'Haene, for *Cattleya Trianae* vars.; to Mr. Jules Hye-Leyssen, for *Cypripedium Spicarianum magnificum*, and for *Lycaste Skinneri alba*, and *Cypripedium Argus*; to Messrs. Vervaeck & Co., for *Cattleya Trianae* var. No. 5; and for *Cypripedium vernixium* and *Odontoglossum Wilkeanum*.

SOCIÉTÉ NATIONALE D'HORTICULTURE DE FRANCE.—As attempts are being made to reorganise the Royal Horticultural Society, it may be of interest to state, on the authority of Mr. F. BEUGMANN, the Secretary, that the French Society has now 2500 members, divided into *membres titulaires*, who pay 20 francs a year, and after thirty years membership may, if they apply, be named *membres honoraires*, and then they have nothing more to pay. These *membres titulaires* form the main body of the Society; there are a few *Dames Patronnesses*, who pay 25 francs a year, and a few *membres correspondants*, elected by the Council. A member by paying 250 francs cash becomes a life member; if he gives 20 francs *rente* on the French Fund (Government 3 per cents.), he becomes a perpetual member, &c. The Society was founded in 1826, and has been royal, national, and imperial, and is now national again. The Chief of the State is called its *Protecteur*, the Minister of Agriculture is *President d'Honneur*, but they never interfere with the Society except to preside over the opening of its exhibitions. The affairs are conducted by a *Conseil d'Administration*, elected by the Fellows. It is composed of:—President, elected for four years, and re-eligible; First Vice-President, elected for four years, and re-eligible; four Vice-Presidents, elected for two years, and not re-eligible till after the lapse of a year; one Secretary-General, elected for four years, and

re-eligible; one Secretary-General-Assistant, elected for four years, and re-eligible; four Secretaries, elected for two years, and not re-eligible; one Treasurer, elected for four years, and re-eligible; one Treasurer-Assistant, elected for four years, and re-eligible; one Librarian, elected for four years, and re-eligible; one Librarian-Assistant, elected for four years, and re-eligible. These sixteen gentlemen form the *Bureau*; many things can be decided by them alone. The other members of the Council are sixteen *Conseillers*, elected for four years, and not re-eligible till after the lapse of a year, a delegate from each of the committees, the Secretary, and Editor, elected by the Council. The Society has seven committees, for pomology, kitchen-gardening, floriculture, horticultural industries, science, tree culture and forestry and landscape gardening respectively. The members of the Society may become members of whichever committee they like. The officers of these committees are elected by the members themselves. These committees prepare the work and make the awards, which are then submitted to the assembly or meeting for ratification. There are also seven administrative committees—Exhibition, Publication, Finance, Household, Awards, Arbitration, Mutual Assistance; the members of these sub-committees are named by the Council.

"BOTANICAL MAGAZINE."—The February number contains illustrations of the following plants:—*Anorhophallus viruosus*, t. 6978.—A fine species, closely allied to *A. campanulatus*, but differing in the large circular spots on the spathe. It flowered in the Royal Gardens, Kew, in June last. The species was originally described in our columns by Mr. N. E. Brown (*Gardeners' Chronicle*, 1885, vol. xxiii., p. 759).

Celogyne Massangeana, t. 6979.—A pretty species, described by Professor REICHENBACH from a specimen which flowered in the collection of M. MASSANGE, of Baillonville (see *Gardeners' Chronicle*, x., 1878, p. 684, and xvii., 1882, p. 369). The flowers are in pendulous glabrous racemes, the segments buff-coloured, the two side lobes of the lip striped with brown, the central lobe much shorter, circular, with a short central point, and marked on its disc with a number of wart-like processes.

Salvia scapiformis, HANCE, t. 6980.—A Formosan and Khasian (East Bengal) species, with stalked oblong crenate leaves and elongated spikes of small amethystine-blue flowers. Flowered at Kew.

Aloe Hildebrandtii, t. 6981.—For horticultural purposes, says Mr. BAKER, this Aloe is "one of the most desirable of all the Aloes from its compact growth and the unprecedented abundance of its flowers," which are flesh-coloured with green tips. It has an erect stem, amplexicaul, lanceolate leaves and a large branching panicle. It is a native of East Tropical Africa.

Oncidium Jonesianum, t. 6982 (see *Gardeners' Chronicle*, xx., 1881, p. 781).—A species with thick pendulous quill-like leaves and slender many-flowered racemes. Each flower is about 2 inches across in the long diameter with oblong green segments, mottled with purplish-brown, and with a broad roundish white lip, the base of which is provided with a series of yellow pointed tubercles. Native of Paraguay. Flowered at Kew.

AMARABOYA SPLENDIDA.—A magnificent greenhouse shrub, native of New Granada, with square stems, sessile, opposite, oblong acute ribbed leaves, purple on the under surface, and with circular flowers nearly 5 inches across, with six oblong obtuse petals, of a rich rose colour, tapering into a wedge-shaped white base. Stamens fourteen. These plants are so splendid that it is a matter for surprise that they are not better known. The plant now mentioned is figured in the *Lindley*, t. 34.

ROYAL AGRICULTURAL BENEVOLENT INSTITUTION.—At the last monthly meeting of the Council of this Institution, held at 26, Charles Street, St. James', it was resolved:—That at the

next election, on June 13, 120 fresh pensioners should be added to the list of annuitants, viz., twenty married couples, twenty males, forty females, and twenty octogenarians.

LARGE GOVERNMENT ORDER FOR FOREST TREES.—We note in the *Dumfries and Galloway Standard* that the firm of Messrs. T. KENNEDY & Co., nurserymen, Dumfries, were recently invited by Her Majesty's Commissioners of Woods and Forests to tender an offer to supply 600,000 young forest trees of specified varieties for planting on the Crown lands in the Isle of Man. Their offer has been accepted for over a quarter of a million plants, which have to be straightforth delivered to the Crown Receiver at Douglas. The order consists of Birch trees, Beech, Sycamore, Alder, Silver Fir, Corsican Pine, Austrian Pine, Douglas Spruce, Scotch Firs.

THE SUPPLEMENTARY SHEET.

THE LAPAGERIA-HOUSE AT WORKSOP MANOR.—The house planted with Lapagerias shown in our supplementary illustration is a lean-to facing north. It is 45 feet long and 10 feet wide, and contains three plants, viz., *L. rosea* and its varieties *rubra* and *alba*, planted ten years ago in well-drained boxes—peat, charcoal, and silver-sand being the materials used to fill them. The shoots are tied to wires so as to make them intermingle, the red varieties being at each end, and the white one in the middle. The plants are liberally supplied with rain-water, occasionally with weak manure-water from the farmyard tank during the flowering season, which lasts from six to eight months. Mr. T. H. Sutton, the gardener, informs us that at the time the photograph was taken there were about 1800 blooms on the plants.

The back wall of the house is covered with Roses—Gloire de Dijon, Homer, Sombreuil, and Reine Marie Henriette, which are now finely blooming.

VALLOTA PURPUREA.

This South African bulbous plant is too well known to require a lengthy description; suffice it to say that it belongs to the natural order Amaryllidaceæ, is allied to *Cyrtanthus*, and is amenable to greenhouse treatment, and in the warmest parts of England may be grown very well on sunny borders with a fair prospect of success. The plants delight in a soil composed of fibry loam, leaf-mould, burnt earth, and sand; and should be planted the height of the bulb below the surface of the soil, which should be made very firm at the time of potting. It dislikes to be disturbed, and it is therefore essential to success in its cultivation to afford it the most thorough drainage, so that beyond annual top-dressing nothing shall be required for three or four years. When the increase of the bulbs in number points to the necessity of more root space being afforded, it will be found best to shift the root-mass into a larger pot with but little disturbance of the roots. This operation is most properly done during June and July, when root-action commences, before the flower-scapes are thrown up. When the roots are in a crowded state, and have been long in the pot or tub, occasional waterings with manure-water in dry weather have a good effect.

The large specimen pictured in our Supplementary Sheet is that of the plant belonging originally to Messrs. Knight & Co., of Ore, near Hastings, and exhibited by them on September 14 and 15, 1887, at the Brighton and Sussex Horticultural Show. The variety is *V. p. magnifica*, and differs from the type by its robustness, the greater size of the flowers, and the white colour in the throat. It had fifty-three spikes of from five to seven flowers on each.

This specimen has since passed into the possession of Mrs. Lade, of Nash Court, Faversham, under the care of whose gardener, Mr. Humphrey, it is, judging from what we saw of it lately, likely to maintain its health, and increase in size.

HOME CORRESPONDENCE.

Correspondents will greatly oblige by sending early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Photographs or drawings of gardens, or of remarkable plants, trees, &c., are also solicited.

LETHORION.—Our attention has been drawn to your remarks in last week's *Gardeners' Chronicle*, in reply to a correspondent's letter complaining that one of our Lethorion cones had exploded in his hand, and announcing it as a dangerous compound. We think the writer would have acted more fairly if he had made his complaint in the first place direct to us, as we could easily have eased his mind on this matter. To convince your readers that there is nothing explosive or dangerous in the cones we have up to the present time sent out many thousands, and, with this one exception, there has not been a single complaint; but on the other hand, in every instance where they have been tested fairly according to the directions and without prejudice, they have given the greatest satisfaction. We distinctly state that there is nothing explosive used in manipulation of the active properties, and it is the most simple and harmless article that could be produced if used according to the directions. If the cone was roughly shaken, as your correspondent says, after having been lighted, it is possible that the small bottle might have broken, and its contents become ignited instead of evaporating; but, as there is no necessity to shake or break the bottle, this cannot occur. The manufacture has been entrusted to the entire supervision and management of highly experienced chemists, who would, if necessary, prove to any one that risk from explosion is impossible. *Corry, Soper, Fowler & Co.* [The correspondent whose complaint was forwarded to us still maintains that there was no carelessness on his part. En.]

Seeing the complaint made in your last number of 11th inst., at p. 177, I think it fair to say that I had first received some sample cones through the Standard Manufacturing Company, of Derby, and that I tried a large and a small cone for aphides with most satisfactory results. So much so, that I intend calling the attention of the Royal Tuscan Horticultural Company to its merits, at their next monthly meeting, to take place in a few days. I lighted mine with a candle, which is the best way to insure the cones being lighted all round so as to burn regularly. I remarked they emitted little sparks, caused probably by nitre or some such substance, used to ensure combustion, and I can perfectly understand that one of these bright scintillæ falling into a match-box would ignite the contents. *H. J. Ross.*

NOTES ON THE NEWER VARIETIES OF PEAS.—While most people will admit that considerable sums have been expended for small returns for new Peas during recent years, yet I cannot agree with those who say that the money so spent is all lost. I have bought several of the new Peas as they were sent out, and, to give them a fair trial, I have always sown them towards the end of a row of some tried kind. Very often they will not grow again, but now and then I found one that was worth further trial, and eventually after several trials it has taken the place of some old variety that was discarded. The result is that now I grow only one variety that I grew fifteen years ago, and that is Ringleader, which with me is still a few days earlier than any other kind. I may say that earliness is its only recommendation, William I. being a much better Pea. It is rather surprising that Peas should vary so much on different soils. When Mr. Walker sent out his Perpetual Bearer, a friend who obtains very good results on the Oxford clay, wrote me a very glowing account of it. I forget the exact dates, but I believe he took 1st prize at the Oxford show in July, and the 1st prize again in September from the same sowing. According to my usual practice I tried it, and, contrary to my custom, planted a long row of it, but good as it was on the Oxford clay, it proved a complete failure on the Bagshot sand. The kinds I now grow are Ringleader, William I., Criterion, Satisfaction, Huntingdonian, Sturdy, and Emperor of the Marrows. A few of the American Wonder Pea I sow at the very foot of a sunny wall—a position which makes it a little earlier than Ringleader grown a few feet away from the wall. I will not enumerate the many kinds

I have tried and found wanting in one or other of the three requisites of a good Pea. It should be a good cropper, with flowers that set well at all times, and are produced in long succession. Many of the recent introductions fail in this latter point; they bear a prodigious crop of pods, but all are ready to gather at the same time, which is all very well for a market grower, but it renders them of much less value for a gentleman's garden. Of such a character are Day's Sunrise and Dr. Maclean, and the very reverse of this is Sturdy, an excellent dwarf Pea. *G. B.*

EMIGRATING GARDENERS.—I quite agree with Messrs. Curtis, Sandford & Co., that emigration is the best remedy for the poverty from which the gardening profession suffers; and if we only knew which country gardeners would be most likely to succeed in, I think there are plenty amongst us who would want but little persuading to go, and thus make room for those left. In our own colonies there is no demand for any but the agricultural labourer. Professional classes (which, I suppose, includes gardeners) are particularly warned against going. Perhaps some of your readers will be able to give us a little advice on the subject. *Emigrant*, ["Emigrant" should apply at the Government Emigration Enquiry Office, Westminster, where he will get the latest and most trustworthy information. Ed.]

GALANTHUS SHARLOCKI.—I enclose flowers of *Galanthus Sharlocki*, as it seems to be of botanical interest, not only from the green lines on the outer perianth segments, but also from the two upright green leaf-like bracts [which result from the splitting of one. Ed.]. If the latter peculiarity is caused by the flower-bud requiring more protection than that of the common Snowdrop, the position in which *G. Sharlocki* was originally discovered, would be of peculiar interest. Is its origin known? *C. M. O.*

DISEASED EUCHARIS RESTORED TO HEALTH.—[The following letter from a friend of Mr. W. B. Grove, St. Vincent Street, Birmingham, has been forwarded by the latter gentleman for publication, and may be of service to those who may have *Eucharis* affected with the fungus disease described by Mr. W. B. Grove in our columns March 27, 1866. Ed.]

—Referring to yours of April 16, 1886, respecting *Eucharis* bulbs, I am pleased to say that my bulbs are now one of the healthiest stocks in this part of the country. As I told you, I potted some diseased bulbs and some good ones in the same pot; the result is, they are both now healthy and vigorous bulbs. From what I have seen of the *Eucharis* mite, I am almost of opinion that it is only when the bulbs have been allowed, through bad management or overwork, to fall in a sickly state, and the outside of bulbs begins to rot. Then the mite begins to appear—as I take it—the rotten portion of the bulb furnishing it with food. I find that the *Eucharis* is often grown in situations not suitable, viz., in too much light, as I find mine to do much better when heavily-shaded. I also find that when a bulb is badly diseased it is much better to cut the roots clean away and leaves also, than to attempt to renovate it with old roots and leaves left on. I followed your advice as far as possible. My plants are not plugged, but are standing on stages immediately above very hot pipes. I keep them well supplied with water both at roots and leaves; my house is continually dripping with water. *Henry Porter.*

THE WINTER IN LANCASHIRE.—The past week has been very wintry with us here, though we have not had so much snow as has fallen in southern and inland districts, still the cold has been great, and the past ten days have been the severest experienced this winter. February 11, 12, and 13 were very cold, with snow and hail and sharp north-westerly winds. Monday evening, however, was much calmer, and there were signs of a sharp cold night, and still many were surprised on the Tuesday to find their thermometers had registered from 18° to 24° of frost. This was a very sudden fall, and on Wednesday and Thursday it continued very cold, and on Friday the 17th 16°, and on Saturday 10° of frost were recorded. Early this morning (Monday) we had a fall of snow, but it soon disappeared. This amount of cold will retard the ascent of sap in trees and shrubs that already were beginning to show signs of growth. Desirable as an early spring may be, it is too often the cause of regret and loss, rather than of pleasure and satisfaction. There is yet time for a period of cold weather, and coming now, ere much growth has commenced, it will retard vegetation beneficially. *W. Swan, Avenham Park, Preston.*

DAFFODILS GROWN AS HYACINTHS IN GLASSES.—By this post I send you the bulb and glass, so that you may see the result of a mere accident. Six bulbs of Ard Righ single Trumpet Daffodil were given to a gentleman for trial in pots, but by some error on his part he gave the bulbs to his cook, who put them in claret glasses of water last November. The result is that the entire six bulbs have bloomed as you see the sample, quite drawn up from the heat of a dark kitchen, and not as they otherwise would have been under proper treatment. I have no doubt but if they were treated properly, after the fashion of Hyacinths, and glasses made to fit the bulbs at the "neck," with a little moss or whole charcoal in the water, and put near the light to keep them short and sturdy, that very good blooms could be procured by this method of cultivation, and also very early. I do not know if all Daffodils would stand the experiment. Certainly well ripened bulbs of princeps or Ard Righ, and probably Horsefield would answer. Have any of your readers tried or heard of the experiment? *Daffodil.*

SOLOMON'S SEAL SCENTED.—The query was raised in your columns by "D. T. F." in June, 1886, whether Solomon's Seal was fragrant, and I then replied that I found it to be so in the garden clumps. This evening on entering my library I was surprised by a strong fragrance, which I found to arise from a large pot of Solomon's Seal which had been forced in a cool greenhouse, and which my gardener had placed there to prove its possession of a most fragrant scent. The odour is that of the Almond, and it is most powerfully developed, as it quite fills the greenhouse with a fragrant odour. If "D. T. F." doubts this I hope he will put the matter to the proof, as there can be no doubt about the fact. *W. Brockbank, Brockhurst, Didsbury, Feb. 9.*

THE ROYAL HORTICULTURAL SOCIETY.—My objections to Mr. Burbidge's original proposal as to the appointment of a Botanical Assistant Secretary to this society, on the lines suggested by him, are, that his view of the case points to the conclusion that such an official would prove the saving force of the Society if possessing ample powers. Now if the Society were a pure autocracy the appointment of an autocrat, if a capable man, might be attended with beneficial results—although I fail to see from what source such a man is to be drawn. But the Society is a representative body, and just recently the great demand on the part of its members has been for fuller representation—a state of things absolutely incompatible with autocracy. So far the chief fault seems to have lain in the imperfect constitution of the Council, because of the grave defects of a representative nature found in the Society. Efforts are being made to amend that defect, with the possible result that a very diverse and much more capable body of men may shortly form the governing body. Now if this wonderful official, who is to be the select Assistant Secretary, he appointed he must be either the master of the Council—a condition of things which would be intolerable—or else the servant; and if the latter in what way could the Council be better served than through its own existing servants? The Society has had Secretaries and Assistant Secretaries *ad infinitum*, but the real defect of government has lain in the composition of the Council. If a new official be appointed to become the Society's autocrat it will be officialised with a vengeance. If he be but a servant he could then only perform duties which existing servants could do just as well. Still it is so easy to understand the faith officials have in the power of officialism. I read Mr. Fish's interesting paper upon the re-constitution of the Society, and, whilst agreeing with many of his conclusions, seriously differ from him in his assumption that the retention of Chiswick garden is a matter of no great importance. I awaited the result of the general meeting of the Fellows—because till then everything was in a state of uncertainty—to send to Chiswick seeds and plants for the production of subjects requiring the attention of the committees later on. These things are not "rubbish," as so indiscriminately denounced by Mr. Hibberd recently, but selections, and were sent to Chiswick for trial, because only under ordinary culture and growth can the committees adjudicate upon their merits. Very probably some fifty other persons may be anxious to do the same thing; thus adding to the interest of the garden, and providing work for the committee of the most useful and instructive kind. For this reason alone, apart from many others

which could be advanced, I should regard the obliteration of a garden in connection with the Royal Horticultural Society as a serious misfortune; in fact, it would be the lopping off of its most useful limb. The reference to what the Royal Agricultural Society has done for agriculture is just now, considering the condition of agriculture, not a happy one; the revolution to which Mr. Fish refers seems to have been in the wrong direction. What we rather want now is to see our agriculture "gardenised," and to that end a strong national horticultural society might contribute something useful. After all, this must be said—the general conditions of political, social, and commercial life are gradually changing, and, without doubt, the Royal Horticultural Society, in common with other institutions, is feeling the force of the revolution. *Spade.*

CELERIES.—Permit me to draw attention to two Celeries of sterling merit, viz., Sutton's White Gem and Carter's Incomparable Crimson, the former being an excellent extra early sort, of compact solid growth, with but little waste, and indispensable for early supplies and exhibition; as such, perhaps it has no superior. The latter is of medium growth, late, and possessing this exceptional advantage over most other varieties, viz., that the very outside leaf-stalks are equal in flavour and crispness to the centre ones; hence there is no waste whatever. This absence of stringiness may probably militate somewhat against it becoming a market kind, for it is so extraordinarily brittle that the utmost care is necessary in handling the sticks to prevent their snapping; but for private use none surpasses it in merit. It is also later in bolting in the spring than many other late varieties. *J. R.*

LATE BRITISH APPLES AND PEARS.—Fruit growers (either private or trade) may be glad to hear of the following announcement:—With the view to increase the production of late varieties of hardy fruits the Vegetarian Society (London Auxiliary) invite quotations for delivery during the next two months of any quantities of Apples and Pears of sound table sorts, and, if possible, with the correct names carefully affixed, so that an increasing interest may be gradually taken by the fruit-eating public in the best kinds of these wholesome fruits. Quotations should include packages and delivery in London. As there is to be a two months' Food Reform Mission in the West End, commencing March 1, when samples of fruit and cereal foods will be distributed, this should prove a practical method of helping both producers and consumers. *W. S. Manning, 8, St. Bride Street, Ludgate Circus.*

A GOOD VARIETY OF POTATO.—As an excellent late Potato, suitable for growing on a chalky soil, I can honestly recommend a variety I have grown here for some few years under the name of Peach Blow or Peach Blossom. I do not find it mentioned in any of the catalogues now coming to hand—a circumstance probably due to its not being an exhibition variety, the eyes being a little too deep for that purpose. Its character may be briefly stated thus:—Shape round, strong grower, heavy cropper, fit for use from October till the end of June; flesh white, and when properly cooked floury, reminding one of the old Fortyfold. Some years ago I grew as many as forty varieties, and discarded annually such as were not considered good enough for the table, till now I am reduced to three varieties only, viz., the one under notice, Myatt's Ash-leaf, and Beauty of Hebron—a few of Myatt's only being grown in frames and on south borders for early use. I must confess we were reluctant to part with *Magnum Bonum* on account of its disease-resisting qualities, but at last have decided on doing so solely because of it being too large for ordinary table use [too much manure]. A Potato which requires to be cut in half, or in three or four pieces, before being cooked is quite unsuited for any table where good quality is the first consideration. *J. Horsfield, Heytesbury.* [Peach Blow has been in commerce for more than a dozen years. It is rich in starch, and is therefore a useful tuber for spirit distillation, starch making, &c. It is of American origin. Ed.]

FIELD MICE.—On p. 184 "West Cheshire" complains of field mice attacking crops and plants. I have been troubled this winter more than ever by their barking and eating off Brussels Sprouts, and as I will not tolerate cats on account of them destroying useful birds, I have to do the mousing without them. When I first noticed the mischief I was a little uncertain as to my enemy: I took up a few steel mouse-traps and set at the entrance of some diseased

mole runs, and first caught a common shrew-mouse. I also set traps close up to the stems of Sprouts that were freshly bitten, and soon caught a number of small field mice, with thick heads and short tails, which are about half the size of the large field mice met with plentifully in the hayfields in summer. I have frequently caught mice of the same species before, but considered them to be dormice. I enclose one which I took from one of the traps today. [It is a species of field-mouse, but it was too decomposed for us to determine which one. Ed.]. If not dormice, please describe the difference. In setting this kind of trap it is very necessary that the catch should be set as slightly as possible, so that the least touch will let it off, and also to keep the catch greased, or it rusts and sets so fast that a mouse does not let it off. This is the kind of trap I use in the house and all over the premises, and need no cats, these animals proving a nuisance in many ways. When Peas and Beans have been attacked—which may always be seen by noticing the rows having small holes scratched out down to the seed—I have used the common wood-and-wire trap, which catches them alive. My plan is to split a bean and bore a small hole with the point of a penknife nearly through, and push the small hooked wire through so that it fits tight on the wire, to prevent the mouse taking bait without letting off the trap. I have never any difficulty in catching these long-tailed mice, which have also the reputation of robbing the bee-hives in the winter months. *J. Hiam, The Wren's Nest, Astwood Bank, Worcestershire.*

— Mr. Dod's article on the destructive tendency of mice in gardens recalls very forcibly the losses I have sustained through the troublesome action of these creatures, which, though insignificant in size, have a capacity for mischief far beyond what might be assumed from their bulk, and they have a provoking disposition to select the most treasured plants in the rock garden. When snow covers the ground mice work in security beneath it, and they are safe for the time from both cats and traps—the aids which I chiefly employ to keep these pests in check. The various kinds of *Choiranthus*, *Anemone*, and *Dianthus* often suffer under the circumstances which I have mentioned. The late heavy snowfall gives me many uneasy moments on that account. Mice have an inherited taste for alpine plants and their seeds: I have seen evidence of their presence at considerable altitudes on the Alps; I know a chalet left untenanted during the winter by its owners which, though nearly 9000 feet above the sea-level is yet infested by mice in the absence of its proper occupants. I suffered an invasion a few years since from the bank vole, which is smaller than the field vole, and of a foxy colour, and more inclined to be gregarious than its relation of the field. A colony appeared suddenly on a slope thickly covered with the lesser Periwinkle, *Viola minor*, four years ago, the stalks of which it severed. The extent of the havoc committed may be judged from the fact that quite a cartload of dead stalks, the work of the vole, was removed from the bank. From this position they advanced to a large clump of evergreens, barking most of them, particularly *Laurustinus*, and then vanished. This vole seems to have some of the gregarious habits of the Norwegian lemming in taking a line of country and clearing all before it, and then disappearing. For the last two years I have sought for specimens of the bank vole for a friend, but fruitlessly. *Wm. Ingram, Belvoir.*

PROPAGATION OF DOUBLE-FLOWED PRIMULAS.—These are not so generally grown in private gardens as they deserve to be, the reason being that they cannot be raised from seed so freely as the single varieties of Chinese Primulas. They are, nevertheless, very readily propagated by cuttings after flowering, and, considering their decorative value as handy material for bouquets, I think there are few green-house plants which produce better results with so small an amount of trouble. With a moderate stock of plants abundance of blooms can be obtained from November (or earlier if desired) until April. I find cuttings strike more readily—or rather they are not liable to damp off—plunged in a hotbed made in a pit or frame, than is the case when a close, stuffy atmosphere is maintained, or the propagating-case is made use of. With proper attention to airing, shading, and watering, I lose not more than 5 per cent. of the cuttings. The compost I use for the cuttings consists of equal portions of light loam, leaf-mould, and silver-sand, and for the repottings I use a larger proportion of good fibrous loam with a few pieces of pulverised bones added. The following kinds are, I find, the best:—

Earl Beaconsfield, very double, colour bright pink—very pretty; King of the Purples, strong, free-growing, profuse-flowering variety, very double, deep purple flowers; White Lady, beautifully fringed, and very double—pure white; Marchioness of Exeter: this is also a very free growing and flowering variety, flowers large and exquisitely fringed, pure white, but if grown in a cold damp atmosphere the flowers are suffused with pink. These were all raised by Mr. Gilbert, of Burghey, if I recollect aright. *Candidissima* is also a free blooming white variety, but the colour is not so pure as the Marchioness and White Lady. *J. H.* [Another method of propagation practised by a well-known grower is described by a correspondent in the following note. Ed.]:—The simple method adopted by Mr. Stevens, of Patney, for propagating this useful plant is one worthy of record. In April some fine cocoa-fibre is heaped up about the stems of the plants, almost touching the lowermost leaf-stalks, and this is kept moist, and in due course roots are put forth into it, and so the plant may be said to renew itself, for when the newly-made roots are strong enough to require that the plants shall be repotted, the stem is severed just above the old soil and repotted, if small, into large 60-pots, but if of good size into 48-sized. Indeed, but little, if any check is experienced, and the plants go on flowering with almost unchecked vigour. There is, therefore, no expenditure of time or labour in taking and striking cuttings; and there is no loss of bloom, for all the while the plants are engaged in putting forth fresh roots they go on producing bloom. Here, double Primulas are in flower almost all the year round, any increase of stock is obtained by the plants throwing out two or three main shoots, as many of them do. They are potted off as soon as ready, and the compost used is

FIG. 30.—WEEVILS AND THEIR GRUBS. (SEE P. 248.)

old *Chrysanthemum* soil that had grown the specimens of the previous autumn, and turned out in a heap in the open for the winter and spring. It is of a light nature, fairly rich, no new manure of any kind was added, and the Primulas appear to thoroughly enjoy it. The secret of keeping the plants in good condition all through the dull part of the winter, Mr. Stevens declares to be in the act of keeping the basal leaves carefully cut away directly they show signs of decaying. He holds the opinion that they convey damp and rot to the main stem, which causes the loss of plants. Since he has adopted this practice he rarely loses a plant, and he holds that the end attained justifies his action. It will be long before any double Chinese Primula is raised so persistent in blooming as the old double white. Thanks to Messrs. Gilbert, Sutton, and others, they have produced fine and distinct varieties; but none of them show the almost perennial profusion of flower shown by this old favourite. *R. D.*

HARDY PLANTS IN FLOWER AT THE YORK NURSERIES, FEBRUARY 7.—The mild weather of the last few days has tempted many spring beauties to show themselves. Of rarer plants *Leontice altaica*, with its pretty yellow flowers, was rather taking; *Hepatica trifolia* in the sunshine was charming, and so was *Saxifraga Barseriana major*, with its pure white blossoms almost hiding the pretty rosettes of its leaves; this *Saxifraga* has been in flower for nearly six weeks. Among better known plants a long bed of *Leucoium vernum* quite captivated me. Who does not care for delicate white flowers with a scent as delicate? *Hepaticas* of various colours, the fair blue *Anemone blanda*, and *Primrose Harbinger*, ought to be well known enough not to require praise; *Helleborus colchicus*, purple (not very deep), and *H. olympicus*, greenish-white, were effective, especially the latter. The Christmas Roses were going off, though enough were still left

in blossom to give an idea of the glorious sight they must have presented when 60,000 or 70,000 plants were in flower together. Perhaps Madame Fourcade kept its flowers best. I would strongly recommend, after trying it several times, *Helleborus corsicus* (it has many other names in catalogues) for cutting foliage from to arrange with Christmas Roses; its leaves keep their colour and firmness for at least a fortnight. I was much struck in walking through the rock garden when the sun was shining with a scent which seemed to load the air; on searching for the cause I found a strong plant of *Cistus cyprius*. *North-Easter.*

DRYING OFF OF ALLAMANDAS.—The question sometimes arises, Should the Allamanda be dried off so as to lose all its leaves? I say it should not, for by drying off and afterwards cutting back the shoots the effectiveness of the plant is destroyed. The fact of its being an evergreen climber indicates the erroneousness of the practice of drying off and pruning the branches in; not only so, but the latter method encourages the growth of gross wood, and robs the plant of its pendent flowering branches. In the winter months little water will be wanted, unless the specimen should stand in a very dry position. *Mayflower.*

PLANTING AT OAKWOOD, SURREY.—One of the latest novelties at Oakwood is a miniature mountain, modelled partly after a very old friend in Perthshire, Schiehallion. When the question of planting came up I was fortunate enough to find Mr. Anthony Waterer disengaged, so we inspected and thoroughly discussed his dwarf Conifers in their beds. I had no conception that he had such a number of beautiful forms. These and some species of Box, *Euonymus*, *Osmanthus*, &c., were duly planted, and towards the base of the east side a collection of hardy Heaths from Mr. Smith, of Darleydale, and in the same line on the north side a number of seedling *Menziesias* taken from an old Heath bed, where they show themselves very freely. The west side of the mountain is planted with seedling Conifers, grown in the wood from seed kindly sent me from the Himalayas. The north side slopes down to a bog, of which so far the only inhabitants are offshoots from a large plant of *Bog Myrtle*, brought by me many years ago from Perthshire. So far all the plants look extremely well. *G. F. Wilson.*

ARALIA JAPONICA.—With reference to the remarks of "R. D." (p. 180) regarding the non-flowering of *Aralia japonica*, I have similar experience to record. A fine large plant, growing in the open air, which has flowered freely for years past, gave last autumn the promise of flowering, but finding they were long in pushing up, I examined the buds, which were large, but, alas! found them all quite decayed, and resembling very much a ripe Medlar. The dry summer of 1887 may be the cause—at least, the growth made is not so robust, as our specimen hitherto has made; the plant was usually in full flower during December. I may remark that I never saw the *Laurastinus* bushes so full of flower as they are just now; the garden is quite ablaze with their beautiful white flowers, and the trusses much larger than usual, which is doubtless due to the warmth enjoyed in 1887. *D. C., Powerscourt.*

COCKROACHES.—I herewith enclose three cockroaches, in order to see if you can recommend anything that would do away with them. I have been catching them for the past two years with beer in bottles, set as a trap. Some weeks I catch as many as 200. They are very destructive to Orchids. *W. Watson, Co. Down.* [We have had several similar communications lately. A good remedy seems in general demand. Ed.]

BULLFINCHES AND FRUIT-BUDS.—These birds have been more numerous this winter than ever noticed, and although I have taken exactly sixty in or round my garden with properly constructed trap cages since September last, a few remain for which I have a charge or two of powder and shot in waiting. To-day I could have shot a pair on a Green Gage Plum tree, but have paid the penalty before by damaging my trees; and, as I could not get them to take to the hedges or less valuable trees, they are at liberty. As an instance of their destructiveness I may mention that last Monday I watched one single bird on a Plum tree, and counted the rate at which my Plum prospects vanished. In the first minute I distinctly counted twenty-five, and in the second twenty-six bloom-buds pinched off and destroyed. I fetched my gun, shot the bird, opened its stomach and gizzard, which was crammed full of blossom.

This would give a rate of about 1500 buds per hour, or, say, 90,000 buds for the sixty birds on somebody's trees. *J. Hiam, Astwood Bank.*

TRANSPLANTING.—Having successfully removed large trees and evergreens without the aid of a specially designed machine, I am of opinion that those who dispense with their use need not despair of success. It is nearly thirty years since I first saw very large evergreens transplanted by a machine with success, but I have more recently seen a machine at work which with the tree required six-horse power to move it, and I then came to the conclusion that such a cumbersome weight of soil was rather an obstacle to success than otherwise, particularly so as much of the soil removed was not permeated with roots, and if it were not removed with the tree it would be no injury to the tree. To transplant a large *Wellingtonia gigantea* I would first clear away all the soil above the roots, then open a circular trench—say, 10 feet diameter—afterwards reducing this with a fork, so as not to further injure roots, to about 8 feet diameter [If 2 feet thick, this is about 3½ tons]; then around this must be placed some appliance that would enable the operator to clasp it sufficiently to retain it in a compact ball, and much benefit will accrue if this girdle is perforated at the base, so as to permit some strong iron rods being driven underneath; then under this girdle make four holes, penetrating to nearly the centre, and into each thrust a

when planted out to give it a trial, when I think they will be satisfied with the result. I have grown plants of *Coleus* in 7 inch pots, whose diameter was 2½ feet; the markings were more distinct, and the plants larger than if loam had been employed. This was, I think, due to the greater ramifications of the roots which allowed the plants to take up a considerable portion of the sustaining substance of the moss. *Chrysanthemum coronarium* does well in it, and will bloom all the winter if assisted with manure-water, as will also *C. coronarium frutescens*, *Cinerarias*, *Primulas*, *Impatiens Sultanii*, *Nicotiana affinis*, *Abutilons*, *Dielytra*, *Lily of the Valley*, and *Chiono-doxa Luciliae*. It is very good for plants that have to stand in rooms where the air is very dry, as they do not then seem to suffer so much from drought, even when watered less seldom than those grown in loam or peat. *A. S., Monmouth.*

THE SNOWSTORM IN BUTE.—This usually mild island and popular summer resort has not escaped the severity of the weather on this occasion; while last year about this season snow and hard frost prevailed in England and on the Continent, cutting down outside *Tea Roses* in Orleans, France, we in *Rothsay* were having genial spring weather; but just now we are having our share of the cold. Monday opened with from 6 to 8 inches of snow, and every night since from 10° to 16° of frost, excepting last night, when the thermometer ranged

better adapted for the growth of Peas for sowing purposes. *Ed.]*

PROTECTING CAULIFLOWERS.—Up to the present time I have Autumn Giant Cauliflowers in the open garden, which I kept by placing a piece of newspaper over the flowers. I do not know whether this is anything fresh, but it is so to me, to get a supply all winter by so simple a method. The paper keeps out the snow and rain, and the frost does not appear to settle on the flower as it would without this simple protection. *J. Hiam.*

EXCEPTIONS TEST THE RULE.

It is no wonder that naturalists dislike dogmatic assertions, for in Nature variation, to use a Hibernicism, is constant, and its limits are often beyond artificial boundaries, however cleverly constructed. An *Odontoglossum* should produce lateral spikes from the side of the mature pseudobulb, but sometimes the spikes are produced at the top of the bulb, when, in botanical language, the inflorescence becomes terminal.

An illustration of this in *O. Pescatorei*, which occurred at Kew, and was drawn for us by Mr. Weathers, is illustrated in fig. 40.

FIG. 40.—ODONTOGLOSSUM PESCATOREI.

strong 12 or 14 feet plank, and with these as levers the tree can be raised so that a table fixed upon rollers can be run underneath. It may then be drawn away and planted, taking care in its journey that it does not sway about. *Gardener, Newton Nurseries, Chester.*

SOLANUM CORNIGERUM.—Mr. Hart, in the *Gardeners' Chronicle* of January 14, writing about *Solanum cornigerum*, seems to consider it identical with the common *S. mammosum*. At the time I wrote the note concerning it, I had in my hands a fruit of the latter for comparison. The two fruits are very different in appearance and shape. I saw no trace of the lateral horns which give the former its name, and the fruit was smaller and rounder. The flowers and foliage seem to be identical in both species. I may say that all the fruits I obtained in Fernando Noronha were similar, though the horns were irregular in number and form. Probably *S. cornigerum* is a mere variety of *S. mammosum*, and it will be interesting to see if the seeds I brought of it will come up and keep true. *S. mammosum* is not mentioned in the *Flora of Brazil* as a Brazilian plant. *H. N. Ridley.*

FERTILISING MOSS.—I quite agree with your correspondent, Mr. Abel, p. 106, as to the ease with which plants can be grown in the above substance, having tried it with many diverse plants, both hard and soft-wooded, but I have not found that the hard-wooded plants did so well as the soft. I would advise those who find their bedding plants suffer

from 22° to 26° all night, the lowest reading, if I mistake not, which has occurred for many years. But for the friendly covering of snow, vegetation must have suffered severely here. *Michael Cuthbertson, Rothsay, February 16.*

IN WILTS.—In South and West Wilts the snowstorms of the 13th and 14th inst, although of great violence, have been, comparatively speaking, productive of but little injury to trees and shrubs; amongst the latter more damage will doubtless manifest itself on the disappearance of the snow. *J. Horsfield, Heytesbury.*

SAMPLES OF PEA SEED.—We enclose you two small samples of Peas out of one bulk of crop 1887, to show how very largely they may be affected by season. In this case, the Peas being American grown, experienced an even more severe season than ours. We are writing to verify the fact, but we have no doubt that this lot was grown in one field, and are of the same variety, viz., William the First. In our experience we find that hybridised Peas are very apt to vary in sample in extremely dry or wet seasons. We also wish to demonstrate that it is impossible, after such a season as 1887, to identify some varieties of Peas by the appearance of the sample. Another effect of the great heat and drought has been to make many samples look old and shrivelled. *Jacob Wrench & Sons, London Bridge.* [There was great diversity in the samples sent to us; due, doubtless, to the too rapid ripening of the seeds by heat and drought. A cooler climate than that of some parts of Canada is

SOCIETIES.

ROYAL HORTICULTURAL: Feb. 14.

Scientific Committee.

Present: Mr. F. Pascoe, in the chair; Messrs. Murray, Wilson, O'Brien, Ridley, Michael, Smee, Bennett, Smith, Boulger, Morris, Dr. Lowe, and Rev. G. Henslow, Hon. Secretary.

Orchids.—Mr. O'Brien remarked on a so-called *Masdevallia culx*, but which is really *Pleurothallis Barbareana*, bearing minute delicate flowers. A *Dendrobium Kingianum* var. *albidum* was also exhibited. The inflorescence bore eighteen flowers. The original specimen, figured in the *Botanical Magazine*, 1845, No. 61, bears pink flowers, and in the description two only are said to have then been the average number. It was re-figured, in 1850 in the *Botanical Magazine*, No. 4527.

Ponthieva. *Drawing of.*—Mr. Ridley showed a drawing of this genus, by Lehmann, from Ecuador, which was figured and described in the *Gardeners' Chronicle*.

Wallflower, Monstrous.—Mr. Henslow reported upon the specimens exhibited by Mr. Lynch at the last meeting, known as "Miss Hope's." They were not gynanthous, but a form of "double" flowers. The calyx was normal, but contained more or less than ten petals, that is to say, the usual four, and six others representing the stamens. Instead of a pistil, ten axis was prolonged, and terminated with a double flower, having a normal calyx, but a corolla

of an indefinite mass of petals. This case, therefore, resembled the double form of *Helianthemum vulgare*, only in that flower the calyx and corolla are repeated three or four times.

Æcidium pseudo-columnare (J. Kühn).—At the last meeting of the Scientific Committee some specimens of the Silver Fir were exhibited which showed the injury done to the extreme tips of their branches by an *Æcidium*. Having in my herbarium some specimens of the fungus in question which Mr. Munro had sent me some years ago, I submitted them to Professor Julius Kühn, with the request that he would examine them and report whether they were the true *Æcidium columnare* of Albertini and Schweinitz, which has its teliospores on *Vaccinium Vitis-idea* as *Calyptospora Gœppertiana*, or whether they were the recently described *Æcidium pseudo-columnare* into whose life cycle the *Calyptospora* does not enter. Professor Kühn in reply says, that they belong to his *Æcidium pseudo-columnare*, a fungus which has not previously been recorded as British. *Charles B. Plowright*.

Honey from Eucalyptus globulus.—A specimen had been sent from Adelaide, South Australia, to Mr. T. Christy, as possessing similar properties, to those of the tree itself; being, for example, antiseptic in its nature. It is found to be very efficacious in cases of lung disease. The honey can only be procured every other year, as the tree flowers biennially. One peculiarity is that, though liquid on arrival, it rapidly crystallises in this climate. It has a very peculiar flavour and scent.

"*Jambul*," *Eugenia Jambolana*.—Mr. T. Christy sent a growing plant as well as seeds of this important drug. Its peculiarity resides in the power of its seeds to arrest the conversion of starch into sugar; hence its value in diabetes. The seed appears to contain about 31.4 per cent. of oil and 4.32 per cent. of ash; also yellow-green resin and a crystalline principle are present. Experiments with starch and malt extract, with and without jambul, showed that while 22.4 grains were converted into sugar where no jambul was present, only 9.8 grains were changed with 15 grains of the seed; and 6.3 grains of starch became sugar with 25 grains of jambul. It is now used very extensively in America and Germany, and has begun to be employed in England apparently with very beneficial results. From a preliminary analysis, the seed does not appear to contain any starch, and therefore the question arises whether the particular ferment which emulsifies oils in seeds may not generally have a sort of anti-diastatic action. Further details will be found in No. 10 of *Med. Com. Pl. and Drugs*, by Mr. Christy.

Oranges, Cultivation of, in England.—Mr. T. Christy contributed the following remarks upon Orange growing in this country with Dr. Amadeus he tells me how much has been done by grafting in Porto Rico. He recommends the graft to be made on the strong stems, and the plants do much better when not grafted too young. With regard to the transport of the fruit, he believes that the fifteen days' sea journey will be fatal to the quality and flavour of the thin-skinned Oranges, so that it would be better to send some cases of plants of the best varieties for growth in houses here. Since the receipt of the large shipment from Bahia many growers have bought stock of the Orange trees, with the view of so doing, and some correspondents have already contributed some very interesting information, showing how well the culture is understood [see communications from Mr. Jas. Douglas and "M. F.," *Gardeners' Chronicle*, vol. iii., January 14, 1888, pp. 46, 47], and it only remains for the commercial question to be threshed out. One grower informed me that he got so much juice in his fruit that it burst in ripening; so this fact sets at rest the question of hard 'woody fruits' only being produced in this country. Mr. A. Dixon, of Cherkley Court, Leatherhead, has two Orange trees, each bearing more than 200 fruits; and from his Pomeloes he says that he is able to make a delicious preserve. With regard to foreign fruit, a captain in the Mediterranean trade tells me that from his experience in collecting Oranges from most parts of the world where they are grown, he believes the palm for delicately flavoured varieties must be awarded to those from Malta. This he attributes to the great care bestowed in their cultivation. When attending the display of fruit at the Agricultural Show in Paris every year, I have been struck with the fine exhibitions of these fruits together with Citrons and Limes from Algeria; and I was informed that the French government obtained thence the best varieties for

their botanical gardens, and that the trees were in full bearing.

A fine series of home-grown Oranges, Lemons, Citrons, and kindred fruits was exhibited by Mr. Rivers, who has cultivated them for the last twenty years. Mr. Michael corroborated the difficulty of importing Oranges from Bahia—one of the best Orange-growing districts.

Rhododendron Hybrids.—A series was exhibited by Mr. Veitch at the exhibition, as follows:—*R. Imogene*, between *R. Teysmanni*, male (pure yellow), with *R. Taylori* (red), itself a hybrid. It retained the foliage of the male, the blossoms being pale lemon-coloured, tinged with red in the filaments and anthers alone. The red tint was thus almost entirely eliminated. *R. Ruby*.—This is a cross between *R. jasminiflorum* [var. ?] *carminatum* (crimson, female), with *R. multicolor*, var. *Curtisi* (male)—this being a crimson variety of the normally lemon-coloured *R. multicolor*—both parents being red, the offspring was ruby-coloured. Two effects gained were a dwarfer habit and a freer blooming. *R.* (unnamed).—A hybrid between *R. Monarch* (salmon-coloured, female), and *R. malayanum* (pale crimson, male). The influence of the male overpowers the female, as there is no salmon colour in the hybrid, though it has the habit of the male with an increase in the number of flowers. *R.* (white, unnamed).—A cross between *R. Princess Beatrice* (rosy-pink), and *R. multicolor* (lemon). In this case the union of two colours caused the total disappearance of both, the result being a pure white.

Fruit Committee.

A showy exhibit was that of Mr. T. F. Rivers, Sawbridgeworth, which consisted of the Pernambuco, St. Michaels, White, Silver, Long, Maltese two varieties, Egg Oranges, the Faringo and common Shaddock, some few small fruits of Limes, and the white Lemon. All of these were grown at the nursery, Sawbridgeworth, and go far to prove the feasibility of Orange growing for dessert purposes when intelligently carried out. A collection of ninety dishes of Apples came from the same place. These and the Apples shown by others seem to indicate the unusual maturation of the fruit last season. A Silver Banksian Medal was awarded.

Messrs. G. Bunyard & Co., Maidstone, showed 106 dishes of Apples, exceedingly well preserved. (A Silver Banksian Medal.)

Messrs. Cheal & Sons, Crawley, showed seventy dishes, most of them of high colour, as usual from that district. (A Bronze Medal.)

A similar award was made to Mr. Sydney Ford, gr., Leonard's Lee, Horsham, for twenty-four dishes of very fine examples of late keeping Apples; he likewise showed some bunches of the Grape Lady Downe's, which were in good condition still, after having been in the Grape-room twelve weeks.

Sixty dishes of Apples came from Mr. Smee's garden, Wallington.

Mr. C. Ross received a Bronze Medal for a small collection of Apples.

Four dishes of Apples, very well kept, came from Mr. J. Smith, gr., Mentmore, Leighton Buzzard.

Wrench's Variegated Kale, a much-curled variety, and of good colour, was sent from the Chiswick Gardens.

Numerous dishes of Apples were shown by various exhibitors. Mr. C. Blair, Trentham Gardens, Stoke-on-Trent, sent some excellent samples of *Calville Blanche*, stated to have been gathered on February 10 this year; *Royal Pearmain*, and *Keddleston Pippin* were well shown from Mr. R. Dean, Ealing.

Mr. Burnett, The Deepdene Gardens, Dorking, made an interesting exhibit; he had fruit from *Lady Downe's Grape* grafted on to *Black Hamburg*, and also from the same on *West's St. Peter's*, the berries in the former case being large, solid, and good in flavour; those from the latter were small. Mrs. Pince on the *Royal Muscadine* was also shown. The characters of the varieties were greatly altered. The produce in the first and last instance was good, in the other case poor.

Mr. J. Crook, Farnborough Grange, showed in a fairly good condition specimens of *Tomatos*; and Mr. R. Dean contributed two dishes of *Onions*, viz., *Tennis Ball*, a round white-skinned sort, and *Danesfield*, with brown skin.

FIRST-CLASS CERTIFICATES.

To Mr. H. B. May, for *Pteris cretica nobilis*.

To Messrs. J. Veitch & Sons, for *Rhododendron Ruby*.

To Messrs. J. Veitch & Sons, for *Rhododendron Imogene*.

To Messrs. J. Veitch & Sons, for *Ardisia mamillata*.

To Sir Trevor Lawrence, for *Odontoglossom crispum pardalinum*.

To Sir Trevor Lawrence, for *Dendrobium nobile Cooksoni*.

To H. M. Pollett, Esq., for *Dendrobium nobile Cooksoni*.

To Sir Trevor Lawrence, for *Dendrobium chryso-discus*.

To Messrs. F. Sander & Co., for *Lycaste Skinneri Imperator*.

To Mr. C. Turner, for *Tree Carnation Phyllis*.

To Messrs. Paul & Son, for *Iris Histrio*.

To Messrs. H. Cannell & Soas, for *Primula Braid's Seedling*.

CULTURAL COMMENDATION.

To Mr. H. Ballantine, for *Odontoglossom crispum Stevensi*.

EDINBURGH BOTANICAL.

THE Society met on February 9, at 5, St. Andrew Square, Dr. Craig, President, in the chair. A minute expressing the loss the Society had sustained by the death of Professor Dickson, drawn up at the request of the Council, was ordered to be engrossed in the minutes, and an extract sent to the late President's relatives. The President noted how the Society had lost since last meeting four other members including Professor De Bary, Drs. Asa Gray and Boswell of Balmnto.

The following communications were read:—

1. On the Fruits of the Genus *Anemone*. By Professor Edward Janczewski, University, Cracow.

2. Note on *Juncus alpinus*, with exhibition of specimens. By Dr. Buchanan White, F.L.S.

3. Additions to the Scottish Flora during 1887, with a *Résumé* of the Year's Work. By A. Bennett, F.L.S., Croydon.

4. On the Origin of Evergreens. By P. Geddes, F.R.S.E.

5. On Temperature and Vegetation at the Royal Botanic Garden. By R. Lindsay, Curator.

6. On Temperature, &c., at the Glasgow Botanic Garden. By Robert Bullen, Curator.

Report for December, 1887, on Temperature and Vegetation at the Royal Botanic Garden, Edinburgh.—During December last, the thermometer was at or below the freezing point on twenty-four occasions, indicating collectively 132° of frost for the month as against 174° for the corresponding month of 1886. The lowest readings occurred on the 10th, 22°, 11th, 21°; 25th, 20°; 27th, 22°; 31st, 22°. The lowest day temperature was 30° on the 11th, and the highest 52° on the 3rd. Rain, sleet, or snow fell more or less on thirteen days. Only one plant came into flower on the rock garden during December, viz., *Tussilago fragrans*. The total number of species and well marked varieties which have thus flowered during the past year, amounts to 1407 as against 1165 for the preceding year. A record has been kept showing the date when each plant was first observed in flower. The largest number came into flower during the months of May and June, viz., 328 and 445 respectively.

January, 1888.—The weather of January has again been unusually mild for the season. Vegetation is considerably in advance of what it was at the same date last year, early though it was. Frost was registered on fourteen mornings, indicating collectively 67° of frost for the month, as against 91° for the corresponding month last year. The lowest readings of the thermometer occurred on the 3rd, 27°; 19th, 20°; 20th, 24°; 28th, 24°; 29th, 20°. The lowest day temperature was 31°, which occurred on the 19th; and the highest 59°, on the 9th. On six days throughout the month the maximum temperature reached 50°. The rainfall was very light. Snow fell heavily on the 2nd, and slight falls took place during the last four days of the month. On the rock garden twenty-four species and varieties came into flower.

Of the forty plants whose dates of flowering are annually recorded to the Society, the following came into flower:—*Tussilago fragrans*, December 28 (1887), *Dondia epipactis*, January 5; *Corylus Avellana*, January 25; *Galanthus nivalis* and *Crocus suvensis*, January 26; *Galanthus plicatus* and *Scilla precox*, January 26; *S. sibirica* January 30.

Exhibits from the Garden.—Fine truss of *Rhododendron argenteum*, Hook. f., Sikkim Himalayas; *Narcissus cyclaminus*, Portugal; presented to the garden last year by the Rev. C. Wolley Dod, Edge Hall, Malpas. Seedlings of *Helleborus orientalis*,

having different coloured flowers, raised from seed ripened at Balmutto, and presented by the late Dr. Boswell, from the open air. Branch of *Rhododendron dahuricum* in full flower, from the open air.

Report on the Temperature, Vegetation, &c., in the Botanic Garden, Glasgow, November, 1887.—The lowest temperature registered during the month was 24°, or 8° of frost, during the night of the 22nd. Frost was recorded on twelve nights, giving a total of 51°. The mean day temperature has been high for the month, much the lowest reading being 31°, on the 29th; the highest was 47°, on the 5th. The first and last weeks of the month were stormy, with a considerable rainfall. Many fine spring-like days are recorded for the middle of the month, which were very favourable to all kinds of outdoor garden-work. The young wood of all kinds of hardy trees and shrubs is well ripened, and with well-developed buds. All kinds of hardy *Rhododendrons*, also of *Azalea pontica* and Ghent varieties, are unusually well set.

December, 1887.—The lowest temperature registered during the month was 20°, or 12° of frost, during the night of the 10th. Frost was registered on eighteen nights, giving a total of 85°, mostly between the nights of the 3rd and 21st. Since the latter date the mean temperature has been above the average both day and night, frost having been recorded three times only, the lowest being only 2°. The above are the records of a maximum and minimum thermometer at 5 feet from the ground. The temperature on the grass varied from 5° to 6° lower. Owing to the weather being mostly dry the frost retained a firm grip of the ground to the end of the month; hence the low surface temperature. The fall of rain and snow has been light in this neighbourhood.

January, 1888.—The lowest temperatures registered during the month (thermometer 5 feet from the ground) were during the nights of the 18th, 27th and 28th, when 9°, 8°, and 11° were recorded respectively. Frost was registered on thirteen nights, the total being only 54°. The temperature on the grass was generally from 2° to 3° lower. With the exception of the last ten or twelve days the month was remarkably fine, with many spring-like days and a temperature much higher than usual, there being only one day on which the temperature did not rise above the freezing point, that being on the 19th, when 1° was recorded. Since then we have had more or less of real winter weather; fog, rain (sometimes heavy), wind-storms, and latterly snow, alternating with fine days. The changes have been remarkably sudden.

(To be continued.)

NATIONAL CHRYSANTHEMUM.

The report on p. 210 can now be supplemented by stating that it has been definitely arranged to hold a provincial show of Chrysanthemums, and that on the invitation of the Sheffield and West Riding Chrysanthemum Society it will take place at Sheffield, about the third week in November, probably on the 16th and 17th. The Sheffield Society undertakes to guarantee a stipulated sum towards the prize list: the National Society undertakes to offer a sum for prizes in medals and cash, not less than one-third more than the sum guaranteed by the local Society; an equal number of judges to be appointed by each Society, the judges themselves selecting a referee. The local Society to undertake to defray all the expenses usually attending a Chrysanthemum Show, and also the general arrangements, with the exception of those on the show day, which will be carried out conjointly—the National Society receiving one-third of the nett profits, if any; all members of the National Society to be entitled to compete or visit the show free of charge. A sub-committee reported upon proposals for a new catalogue of Chrysanthemums, which shall contain, besides other matters, a selected and full descriptive list of the best varieties of Chrysanthemums for exhibition purposes in the following sections, viz.:—Incurved, Japanese, Japanese reflexed, reflexed, large Anemone, Japanese Anemone, pompon, pompon Anemone; each section to be preceded by a typical illustration and brief description of its general characteristics, and also a complete alphabetical list of Chrysanthemums, with synonyms in italics, also indicating the section to which each belongs; and, further, an abridged description of all those varieties not included in the selected lists.

The committee is to consist of amateurs and gardeners only—Chrysanthemum growers of repute, not necessarily members of the Society.

The Catalogue Committee is formed of Messrs. E. Molyneux, G. Gordon, Harman Payne, C. Orchard, W. K. Woodcock, C. Herries, Shoesmith, Woodgate, Garnett, A. R. Cox, Lyne, Gibson, R. Parker, W. N. Dyer, G. Beckett, E. Sanderson, J. Wright, Flight, E. C. Jukes, Martin, Sullivan, Mease, Salter, Ridout, Udale, A. Salter, Lewis Castle, Kendall, Mardlin, and W. King. Messrs. Castle, Gordon, and Harman Payne, were constituted as the Revision Committee (the latter to act as Secretary). This committee will receive, tabulate, and prepare for the press the reports of the members of the Catalogue Committee.

A Floral Committee was appointed as follows:—Messrs. Stevens, R. Dean, Mardlin, Owen, Bevan, Gordon, Gibson, H. Cannell, Gilbey, Addison, Swift, Wright, Kendall, Castle, and Boyce. The Floral Committee will meet on September 12, October 10 and 24, November 7 and 21, December 5, and January 9.

The Tiverton, St. Neots, Ilinckley, and Faversham Societies were affiliated.

UNITED HORTICULTURAL BENEFIT AND PROVIDENT.

The annual general meeting of this Society took place at the Caledonian Hotel, Adelphi, W. C., on Monday evening, February 13, Mr. Richard Dean in the chair. There was a large attendance of members. The Secretary, Mr. W. Collins, read the report, which stated that during the past year fifty new subscribing members have been added. One member has died—the late W. Heale, one of the original founders, and the first Secretary of the Society, which office he held for a considerable time. The sum paid to his widow amounted to £49 10s. 6½d., the amount standing to his credit under the Benefit Fund. The sum of £13 15s. 0½d. was also paid to the widow of Edward Southern, who had ceased to subscribe for four years, thus illustrating one of the beneficial principles upon which the Society was founded, namely, that subscribers do not lose their deposits when they cease to be members, the amounts standing to their credit on the books of the Society are paid over to the representatives of the persons at their death.

The amount of sick pay afforded to members during the past year has been unusually heavy, amounting to £61 0s. 11d., of this sum £18 3s. 6d. was paid to the late William Heale; £26 4s. 7d. to George Russell, of Maidstone; £9 19s. 6d. to D. Nightingale, and the remainder to five others in small amounts.

The Benevolent Fund has increased considerably during the year, sixteen gentlemen having become honorary members, subscribing one guinea per annum.

There is now a sum of £1000 invested in 3 per cent. Consols, showing an increase of £350 during the past year.

The Treasurer's financial statement was read by Mr. James Hudson, which showed that the receipts for the year amounted to £603 16s. 0½d. and the expenditure to £512 15s. 5d., leaving a balance of £91 0s. 7½d. to be carried forward for the current year.

The Chairman moved the adoption of the report and balance-sheet, which was duly seconded and carried. The following were appointed on the Committee of Management for the ensuing year, in the place of those retiring by rotation:—Messrs. W. Foreman, W. Rapley, Chard, and H. C. Foll. Hearty votes of thanks were then awarded to the trustees and auditors, to Mr. J. Hudson, Treasurer; Mr. W. Collins, Secretary (who was re-elected by acclamation). The sum of £15 was voted from the management fund to the Secretary for his services during the past year. It was resolved that the anniversary dinner should be an annual fixture, to take place in the month of October.

ANCIENT SOCIETY OF YORK FLORISTS.

Mr. T. E. Annex presided at the annual meeting of the members of the above Society at the "White Swan" Inn, Goodramgate, on Tuesday night, Feb. 13.

The annual report, read by Mr. J. Lazenby, the Secretary, stated that the very satisfactory position the Society had attained at the close of 1886 as regarded its business matters was still maintained at the end of last year (1877.) The subscriptions for the past twelve months from members had reached £106, or an increase equivalent to thirty new members. The various shows, held as usual in the

Guildhall, had in the past season been accorded a very much increased attendance of visitors, and it could not be doubted that great good must have resulted from a horticultural point of view. The number of competitors had also increased, although in a pecuniary sense exhibitors had not benefited to any great extent, as the increased vote brought out upwards of forty competitors, amongst whom 1420 prizes were awarded. The Chrysanthemum show again resulted in a great success. The gross receipts were upwards of £200. The special prizes offered by the ex-Lord Mayor (Sir Joseph Terry), the ex-City Sheriff (Mr. Alderman Wright), the stewards, and Messrs. Backhouse & Son, Mr. Deverell, Mr. Morton, and Messrs. Wood & Son, constituted a feature of considerable attraction.

The financial statement showed that there was a balance in hand at the beginning of last year of £106 4s. 3½d., the annual subscriptions and donations amounted to £106; receipts of the three days of the Chrysanthemum show, £179 11s. 4d., and including some other items of income the total was £415 18s. 2d. The expenditure, including award of prizes, printing, advertising, music, judges allowances, Secretary's salary, &c., amounted to £266 17s. 1d., leaving a balance available of £149 1s. 1d., being the largest sum the Society had ever had at disposal at the close of any season.

On the motion of Mr. Cowper, seconded by Mr. W. R. Robinson, the report and balance-sheet were adopted.

The officers were elected as follows:—President, His Grace the Archbishop of York; Senior Vice-President, the Lord Mayor (Mr. Alderman J. Sykes Rymer); Vice-Presidents, the City Sheriff (Mr. S. Border), and Mr. G. Cowper; Stewards, Mr. G. Lamb and Mr. Horsley; Junior Steward, Mr. W. C. Milburn; Treasurer, Mr. J. Fielden. Mr. Lazenby was unanimously re-appointed Secretary.

The following gentlemen were chosen as the committee:—Messrs. Folkard, Key, Moore, Pilmoor, Rodwell, Robinson, Simpson, Smith, Fieldhouse, Douglas, Hudson, and Richardson. Mr. Manton and Mr. G. Pilmoor were elected auditors. An alteration in Rule 8 was made: the annual meeting to be held on the second Tuesday in January, instead of the first Tuesday in February.

Votes of thanks were passed to the donors of special prizes and to the officers of the Society, and the meeting made a grant of £100 for the Chrysanthemum show of 1888, and £40 for the series of periodical exhibitions held in the Guildhall.

THE WEATHER.

Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degrees.—A "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather for the week ending, February 20, is furnished from the Meteorological Office:—

“The weather has been in an unsettled state generally, with frequent showers of snow or sleet. Over the western parts of the kingdom, however, the conditions were finer than elsewhere, and intervals of clear sky were experienced.

“The temperature has been considerably below the mean in all places, the deficit varying from 5° in ‘Ireland, N.’ to 7° or 8° in most other districts, to as much as 9° in ‘Scotland, N.’ and ‘England, S.’ and 10° in ‘England, S.W.’ Over the United Kingdom generally the average temperature for the week has been lower than any registered during the present season. The highest of the maxima, which were recorded on somewhat irregular dates, ranged from 41° in ‘Scotland, N.’ and ‘England, N.E.’ to 46° in the ‘Channel Islands,’ and 49° over Ireland. On most days the readings were lower than these figures, maxima of about 35° being very frequent. The absolute minima were lower over Ireland and Scotland than any previously recorded during the winter. On the 16th the thermometer fell to 1° in ‘Scotland, N.’ (at Lairg), to 4° in ‘Scotland, E.’ (at Braemar), and to 8° in ‘Ireland, W.’ (at Brookeborough). Over England, where the minima were recorded on irregular dates, they ranged from 8° in ‘England, N.W.’ (at Newton Reigny), to 18° in ‘England, S.W.’ and to 25° in ‘England, E.’

“The rainfall has been rather more than the mean in most of the ‘Wheat producing districts,’ but less in the ‘grazing districts.’

“Bright sunshine shows a decrease over the eastern and central parts of Great Britain, but a decided increase over all the western and southern counties, as well as in the west and north of Scotland.”

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MARCH 3. (AVERAGE OF FORTY-FOUR YEARS.)

NOTICES TO CORRESPONDENTS.

APPLES FOR NEW ZEALAND: P. H. G., Princeton, Ill., U.S.A. Thanks for your note, but it is too much like an advertisement to insert in its present form.

ACQUA CUTTINGS: Peto. If you have command of bottom-heat of 75°, and can get growth on the plants by putting them in a temperature of 55°, you may put in the cuttings in March. Strike also under hand-glasses in July and August, or when the young shoots begin to get firm.

BEEBLE: F. G. A weevil, like the one that does so much mischief to vinerias. Trap them with slices of Carrot, &c., and capture them at night.

CAMELLIA REMOVING FROM BORDER TO TUB: Alab-plena. If the plants are carefully taken up, they will transplant as well as Hollies, Laurels, &c. Care must be taken of all small roots and rootlets, and a certain amount of the ball of earth should be left undisturbed. Borders are often made long

and narrow, and as the plants in this case have remained in their place for many years their main roots may have extended laterally, so that considerable numbers of these may have to be sacrificed in putting the plants into the slate tubs. In case there is much need of amputation, a kind of balance must be maintained between roots and head by cutting out some branches in the latter. Defer transplantation till growth has begun; keep the plants rather close and shaded after the operation, and after giving one thorough watering. Mulch the surface of the soil with half-decayed leaves, moss, or cocoa fibre. Sprinkle the foliage by 6 A.M., and again at 5 P.M., and keep the floor moist, but do not treat them as if they were stove plants. Give a little more air in the third week, increasing it to full exposure as the season advances. Be careful not to water the roots freely before root-growth has taken place. The corridor named in your letter will suit them very well. They are not tender, but can endure several degrees of frost without injury.

COCKNOACHES: C. F. C. See Notices to Correspondents at p. 184. Trap them with beer and treacle.

ECCHARIS BULBS: J. Carter. Your bulbs are, as you suppose, affected with the mite. Destroy by burning all those bulbs which are attacked.

FERNS: Both are very pretty crested forms of Pteris serulata. The dwarfier of the two is, as far as we know, not yet in commerce, and is as good a form as we have seen.

FORESTRY: Planter. Arboriculture. By John Grigor. (Edinburgh: Edmoustone & Douglas.)

GARDENERS' ORPHAN FUND: W. Swan. The suggestion about collecting-boxes has already been mooted, and boxes are being made, which will be sent to any secretary of a society, head gardener, nurseryman, and other person, making application for the same.

INSECTS: W. S. and others. Several correspondents have sent us weevils or their grubs (see fig. 39), asking how best to get rid of the pest. At p. 292 in the year 1841 the instructions were as follows:—Strong infusions of tobacco-water, aloes, or quassia poured at the roots of plants when the larva are there are recommended. In order to capture the perfect weevil itself approach the tree or plants attacked and suddenly turn on a light, when the insects will fall down; a tray or cloth should have been previously placed on the ground to receive them. Destroy by applying boiling (not merely warm) water. As the creatures retire into walls, &c., during the daytime, it would be advisable to fill up all chinks and fissures with mortar or cement, &c.—Roseleaf. The work of a mining grub. (See Supplement to our issue for July 7, 1877.)

MANURE AS TOP-DRESSING TO BULBS: G. H. M. It will not have much effect after they have started — the foliage might be made of a darker colour,

NAMES OF PLANTS: J. S. & Co. Should consult some trade grower of Epacris. We cannot pretend to name them.—G. P. Juniperus drupacea. We do not know the Rat's-tail Fern.—J. F. Acokanthera (Toxicophlata) spectabile.—W. H. K. 1, Epidendrum cochlatum; 2, doubtful (see next week); 3, the Hornbeam (Carpinus Betulus).—P. W. Oncidium superbiens and Schomburgkia undulata.—T. Heaton. Oncidium Schillerianum probably, send old bulb and leaves; Croton No. 1, trilobus; Croton No. 2, Mortii?—T. Pusey. Epidendrum Candollei.—J. T. Senecio Giesbreghtii.—Argus. Adiantum Capillus-veneris.—Nash. Dendrobium aureum (artocarpum).—E. Best. Probably a Schomburgkia, or Lælia superbiens. A sudden fall of temperature may have produced this check; or too much water has been supplied, causing the plant to commence growing. Next year remove to a cooler house and keep tolerably dry.

ORCHID BLOOMS FROM AMERICA.—Prof. Reichenbach requests us to state that he has obtained “from an unnamed U.S.N.A. correspondent a wooden box, containing a card box, with German address and five 10-cent stamps, representing ladies. Contents—Odontoglossum mulus: tip-top.”

PALANGONIUMS: J. B. No. You can do nothing more.

POST OF HEAD GARDENER: W. J. I. Can you not emigrate to Canada or the U.S.A.? Good men are wanted there.

HILL & SMITH'S BLACK VARNISH
 for Preserving Ironwork, Wood, or Stone.

(Registered Trade Mark.)
 An excellent substitute for oil paint, at one-third the cost. Used in all London Parks, at Windsor, and Kew Gardens, and on every important estate in the Kingdom. Has stood the test of forty years' trial. Requires no mixing; can be applied cold by any ordinary labourer.
 Price 1s. 6d. per gallon at the manufactory, or carriage-paid to any railway station, 1s. 8d. per gallon in casks of 36, 20, or 10 gallons.
 Every Cask bears the above Registered Trade Mark. Beware of cheap imitations.

CAUTION.
HILL & SMITH, Brierley Ironworks, Dudley; 118, Queen Victoria Street, London, E.C.; 47, Dawson Street, Dublin.

Small size. Price in box, 8/6. Post-free 6d. extra.
"MYTICUTTAH" (REGISTERED).
 PATENTED in GREAT BRITAIN, FRANCE and GERMANY.
 As the S. M. Co.'s "Standard" Tree Pruner is admitted to be the best Pruner for work a] distance from the ground, so will the two "MYTICUTTAHS" prove the handiest and most powerful for Pruning and Trimming close to the ground, such as the removal of shoots from roots of trees; also Shrubs, Fruit and Flower Bushes, Vines, and other climbing plants, &c. Their construction enables prickly Shrubs and Bushes to be Pruned without lacerating the hands or wrists, even if gloves are not worn. They will with ease cut the hardest wood growing without injuring the part left by splitting and drawing the sap several inches up and causing decay, as other implements are known to do.
 For Illustrated PRICE LISTS of above and other NOVELTIES in PRUNING TOOLS, FRUIT and FLOWER GATHERERS, &c., apply to the
STANDARD MANUFACTURING COMPANY, ST. ALKMUND'S CHURCHYARD, DERBY;
 Or to their Agents, the Principal Ironmongers and Seedsmen at home and abroad.

Length 21 inches, weight 2 lb. Will cut a branch over an inch in diam.
 Large size. Price in box, 9/6. Post-free 7 1/2d. extra.

WEEKS'S PATENT DUPLIX BOILER

IS FAR AHEAD OF ALL OTHERS IN EVERY RESPECT.

NOTE A FEW ADVANTAGES.

Mr. FREDERICK H. BENEY, late Foreman at Locko Park Gardens, near Derby, has been appointed Head Gardener to the Lady MANY CURRIE, Clewer Hill House, Windsor.

Mr. G. W. LUCAS, late Head Gardener to CHARLES LIDDELL, Esq., Peasmarsh Place, Sussex, has been appointed as Head Gardener to SYDNEY COURTAULD, Esq., Bocking Place, Braintree, Essex.

WANT PLACES.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be obliged to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

WANTED, A GARDENER !!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—R. B. LAIRD AND SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

SCOTCH GARDENERS.—JOHN DOWIE (of the late firm of Downie & Laird), Seedsman, 14, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

ORCHID GROWER and GARDENER (WORKING).—J. EARL will be pleased to recommend a man as above. Good experience and excellent character.—Nellestone, Ryde, Isle of Wight.

GARDENER (HEAD), where three or more are kept.—Age 28, married; twelve years' good practical experience. Three and a half years in present situation as Second.—F. WOODS, Hurstside, West Molesey, Surrey.

GARDENER (HEAD), where two or three are kept; age 34, married.—Mr. BIGGS, Garnstone, Weobley, Herefordshire, will be pleased to recommend G. Messenger, as above.

GARDENER (HEAD).—Married, no family; thoroughly practical man. Used to Management of Large Gardens, extensive Houses, and Large Staff of Men. Can be highly recommended.—W. T., Failand Hill, near Clifton, Bristol.

GARDENER (HEAD).—Age 32; eighteen years' experience in Early and Late Forcing of Fruits, Flowers, and Vegetables; also Flower and Kitchen Gardens. Excellent character and testimonials. Charles Arthur Tolley.—Apply, Mr. CYPHER, Exotic Nursery, Cheltenham.

GARDENER (HEAD); age 35, Scotch.—J. MCPHAIL, for the last ten years Head Gardener to Colonel Cooper, at Markree Castle, Caloonoy, will shortly be disengaged. Highest testimonials, and Col. Cooper kindly allows reference.

GARDENER (HEAD), where two or three are kept; age 29, single.—J. AMYS, Gardener to the Hon. Mrs. Eliot Yorke, Hamble Cliff, Southampton, can with confidence recommend his Foreman (G. Dovey) as above. Disengaged by the end of March.

GARDENER (HEAD); age 32.—W. T. SCARTH, Esq., Raby Castle, Darlington, Durham, will be glad to recommend James Thellett, who is at present Foreman at Raby Castle Gardens, to any Lady or Gentleman requiring a thoroughly practical good Gardener, first-class Fruit Grower and Plantsman.

GARDENER (HEAD); no incumbrance.—Mr. W. BISHOP, late Gardener to the late Sir E. Jodrell, Bart., and many years at Blytham Park, will be pleased to treat with any Lady or Gentleman requiring the services of a first-class all-round Gardener.—HEAD GARDENER, The Grove, Teddington; or, HEAD GARDENER, Wesley Hall, Bury St. Edmunds.

GARDENER (HEAD); age 36, abstainer.—General NEWDEGATE, of Arbury Hall, Nuneaton, Warwickshire, will be pleased to recommend his Head Gardener, C. Marshall, to any Lady, Nobleman, or Gentleman requiring the services of a thoroughly practical man. Four years in present situation; six and a half years previous as Head. Leaving entirely owing to an alteration in the establishment.—Please address as above.

GARDENER (HEAD); age 33, married, no family.—W. J. IRELAND, late of Nestell Priory, and previously with the Marquis of Headfort, is open for re-engagement. Thoroughly conversant with all matters relative to Horticulture. Protestant. Strong and healthy, and not afraid of exerting himself. Left at own request. Testimonials of the highest order for character and ability.—14A, Upper Winchester Road, Catford, S.E.

GARDENER (HEAD WORKING).—Age 27, single; practical and experienced in all branches of Gardening. Good references. Abstainer.—H. RICHARDS, 11, Railway Cottages, Falmouth.

GARDENER (HEAD WORKING).—Age 36, married; twenty-three years' sound practical experience in every branch of the profession.—HAROLD, Mr. Myatt, Weston Heath, Newport, Salop.

GARDENER (HEAD WORKING).—Experienced in all branches. North or South. Six and a half years in present and nine in last situation.—GARDENER, The Manor House, Colliers Wood, Lower Tooting, S.W.

GARDENER (HEAD WORKING).—Age 26, single; would not object to a small place if comfortable. Good character, and steady man.—J. FORBES, 24, College Street, Putney, S.W.

GARDENER (HEAD WORKING).—Age 47, married, no family; thirty years' practical experience. Head Gardener twenty-two years. Three years' good character from present place. Lodge or cottage preferred.—W. B., Riverside, Palace Road, East Molesey.

GARDENER (HEAD WORKING).—Age 35, married; twenty years' practical experience in all branches of the profession in good establishments in England and Scotland. Five years' good character.—JOHN FINLAYSON, Farnham Royal, Slough, Bucks.

GARDENER (HEAD WORKING).—Age 31, married.—Mr. MITCHELL, Head Gardener to the Right Hon. Lord Wenlock, Esrick Park, York, wishes to recommend his General Foreman, George Taylor, as above, to any Lady or Gentleman requiring the services of a thoroughly practical Gardener.

GARDENER (HEAD WORKING); age 23.—Mr. LINDSEY will be glad to recommend his Foreman, Frederick Kerr, as above; well experienced in Fruit Growing and Forcing, Plant Growing, Cut Flower Decoration, and the General Routine of good Outdoor Gardening. Four years' good character.—The Gardens, Huntroyde Park, Burnley, Lancs.

GARDENER (HEAD WORKING), where not less than three are kept; age 25.—G. GOLDSMITH, The Gardens, Flore House, Weedon, will be pleased to recommend Alfred Nightingale to any Lady or Gentleman requiring a thoroughly energetic man. Has lived with him two and a half years. Seven years' good character from present employer.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Married, no family; thoroughly practical. Over thirty-five years' experience. Total abstainer. Undeniable character.—F. M., 41, Paradise Road, Clapham Road, S.W.

HOLLOWAY'S PILLS.—Nervousness and Want of Energy.—When first the nerves feel unstrung, and listless suppliants energy, it is the right time to take some alternative as Holloway's Pills to prevent disorder running into disease. These excellent Pills correct all irregularities and weaknesses. They act so kindly, yet so energetically on the functions of digestion and assimilation, that the whole body is revived, the blood is rendered richer and purer, the muscles become firmer and stronger, and the nervous and absorbent systems are invigorated. These Pills are suitable for all classes and all ages. They have a most marvellous effect on persons who are out of condition; they soon rectify whatever is in fault, restore strength to the body, and confidence to the mind.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
 HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
 HIS ROYAL HIGHNESS THE PRINCE OF WALES,
 THE KING OF THE BELGIANS,
 The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
 And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

SILENS MESSOR MOWER, with Improved Steel Chains and Handles.

CHRYSANTHEMUMS, HARDY PERENNIALS, FLORISTS' FLOWERS, and other Catalogues.

I have very much pleasure in announcing that my New Catalogues of the above and other plants are now ready, and have been Posted to all Customers, and may be had post-free upon application.

HARDY PERENNIALS.

The present season's edition of this Catalogue has been prepared with an unusual amount of care, and contains almost every known Hardy Perennial of really sterling worth, either as a plant adapted specially for cutting, or as a decorative subject in pots, in the borders, or in beds, and must certainly be admitted to be the most complete Catalogue of Perennials ever published. It is embellished with a number of thoroughly well executed engravings representing many of the specially meritorious and new plants: several of the engravings have been expressly prepared for the work in question. It also contains very complete collections of

**HARDY ORCHIDS, AQUATICS,
AND BOG PLANTS,
GAILLARDIAS, SUNFLOWERS,
POPPIES, IRIS, LILIES,
BAMBOOS, ETC.,
PÆONIES—TREE AND HERBACEOUS.**

These are offered in a separate Catalogue, and go to constitute one of the most complete Collections of these really interesting and practically indispensable flowering plants ever offered. I was awarded, last season, several **FIRST-CLASS CERTIFICATES** for new varieties.

HARDY FLORISTS' FLOWERS.

This Catalogue is one of the most complete and correct of its kind containing every variety of real merit, including Carnations, Plocees, Delphiniums, Pansies, Pyrethrum, Phloxes, Pentstemons, and several other families. Twelve pages of **Novelties** belonging to the families enumerated are also included. The Catalogue is thoroughly complete, well illustrated, and contains abundant cultural notes.

CHRYSANTHEMUMS.

My collection of this family is one of the most complete in Europe. Every variety which is really worthy of cultivation is included. Many varieties are offered in some catalogues which are really valueless: they will not be found in the Catalogue referred to. It extends to twenty pages of really first-class sorts, all fully and correctly described, and is accompanied by a well executed litho of a new, late-flowering, golden-yellow variety, named **GOVERNOR OF GUERNSEY**,

which I have much pleasure in offering this season for the first time, and which I am sure is destined to become the most popular of late-flowering varieties for cutting or for decoration.

HARDY CLIMBERS

are grown at Tottenham upon a most extensive scale. My sales of this section reach prodigious proportions. Large quantities of Ampelopsis, Jasmynes, Clematis, Wistarias, &c., are grown.

HARDY FERNS.

My collection of these has recently been very considerably extended, and now can fairly claim to be a complete and representative one of **Hardy British and American Ferns**, and is a Catalogue well deserving of the attention of all who are interested in this useful class of plants.

HARDY PRIMULAS.

I hold a very extensive collection of these, which includes every variety claiming any real usefulness, amongst which are many beautiful Indian and other forms.

Copies of any of the above **CATALOGUES** may be had upon application.

THOMAS S. WARE,
HALE FARM NURSERIES,
TOTTENHAM, LONDON.

VEITCH'S Collections of SUPERB STOCKS,

THE FINEST IN CULTIVATION.

LARGE-FLOWERING GERMAN TEN-WEEK.

The most popular Stock in cultivation, producing massive pyramidal spikes of large perfectly double flowers of great substance and brilliancy.

Collection of 12 distinct colours, separate, 2s. 6d.

LARGE-FLOWERING PYRAMIDAL TEN-WEEK.

A beautiful class of strong growth and pyramidal habit, bearing large trusses of bloom.

Collection of 12 distinct colours, separate, 2s. 6d.

NEW ROBUST ROCKET TEN-WEEK.

A new, distinct race of robust, very branching, and rather tall habit, having large spikes of splendid double flowers.

Collection of 8 distinct colours, separate, 2s. 6d.

EAST LOTHIAN.

Magnificent variety, producing immense Hyacinth-like spikes of bloom.

Collection of 4 distinct colours, separate, 2s. 6d.

For full descriptions of the above see **SEED CATALOGUE** for 1888, forwarded Gratis and Post-free on application.

THE

Gardeners' Chronicle.

SATURDAY, MARCH 3, 1888.

WINDOW GARDENING.

THERE are probably no small gardens that afford the same amount of pleasure as the several sorts of window garden, from the single pot with its one Pelargonium, or the Hyacinth in a blacking-bottle—for we have seen such things in courts and alleys—or the plain deal box full of hardy plants, to the most costly Fern case and window greenhouse. A garden of some sort or other, from one pot upwards, as observed just now, has found a site in every street in our great metropolis, not excepting those in the humblest quarters.

In fact window gardening has made great advances in recent years, and flower shows for the exhibition of plants grown in such gardens have been greatly encouraged in all parts of the country. One of the best known of exhibitions of this kind was that held annually in the College Garden at Westminster, where its founder, the late Dean Stanley, or the late philanthropic Lord Shaftesbury, or some other friend of the poor, used to distribute the numerous prizes. But there are other shows in London which owe their annual display solely to an assemblage of plants which are grown by humble folk in gardens frequently not exceeding 2 feet wide, and which are situated, in many cases, several storeys above the ground. Another fact connected with window gardens is that their great extension in recent years has multiplied the number of readers of garden literature a hundred-fold, so that a class of papers which were at one time only read in the country are now largely in demand in towns as well.

The kind of house decoration we desire to recommend has, in fact, become universal, not only in England, but throughout Europe and the United States. The windows of Paris present, probably, such a show of foliage plants and flowers as no other city can exhibit; chosen and arranged, too, with such good taste as no other nation but the French possesses. In his capital book on *Domestic Floriculture*, Mr. Burbidge has mentioned among the favourites for window

gardening in Paris and in the towns on the other side of the Rhine as well, Palms, Dracænas, Cyperus, Myoporum, Cobæa scandens, Ferns, Selaginellas, Ficus, Virginian Creeper, the common Oleander, and Ivy. The list might be enlarged, of course, tenfold without exhausting the resources of the windows of Paris, or those of our own West End squares, or of such thoroughfares as Piccadilly and Park Lane. It seems desirable to mention the names of a few, at least, of the most desirable window garden plants, because everyone is liable to forget the component parts of a beautiful array of plants, though the general effect may be still pictured in the memory; but I would not recommend beginners to commence with elaborate window gardening, or with the cultivation of difficult subjects.

In an old farmhouse half hidden by its creepers—Ivy, Roses, Jasmine, Wistaria, and others—two parlour windows are noted in the neighbourhood for their very pretty display of flowers. The climbers are a sufficient ornament outside the windows as the flowers are within. The pots are placed level with the window-sill, 2 feet from the floor, in a wire trough, supported by wire legs—the whole forming an ornamental stand, painted green. The flowers are changed occasionally throughout the year, and they include among the summer favourites Mignonette, Musk, Mimulus, Pelargoniums, Fuchsias, Violets, Tropæolums, Cyclamens, and Balsams. Two common Arums (Richardias) of uncommon size, 5 feet high, and producing numerous large flowers, stand on the floor. I must not forget the Ferns. There is a fernery in the garden filled with the native sorts of Surrey, including the Moonwort from the neighbouring downs; various small Trichomanes, Wall Rue, and big plants of well-grown specimens of Scolopendrium vulgare, Polypody, and others, and some of these are always to be found indoors. I do not know any other dozen and a half of plants that are better grown, or that give more pleasure to those who tend them and watch their progress than those in the windows of this bright home in Surrey.

A word as to the plants just named. It must be understood that all these plants, except such indoor specimens as the Cyclamens, Pelargoniums, and Balsams, are always on the spot, growing to perfection in the very pretty flower garden hard by. There is always the garden to select from, and the favourites are brought on in pots and taken to the windows as required. With a garden in the background, therefore, this kind of window gardening is very much a matter of careful tending of well-grown specimens in pots, with saucers. Provided the colours of adjacent flowers are in harmony, you may remove to the window almost any plant you may fancy. This is perhaps the simplest form of window gardening. *H. E.*

NEW OR NOTEWORTHY PLANTS.

RODRIGUEZIA BUNGEROTHII, n. sp.*

This is a near ally of the old and well-known *Rodriguezia secunda*, H. B., Kth. It may be a little larger in all its parts, at least the abundant specimens provided make me think so. It has a very

* *Rodriguezia Bungeothii*, n. sp.—Omnia *Rodriguezie* secundæ, H. B. Kth., excepto racemo densiori; bracteis densis bipectinatis; ovariis pedicellatis ascendentibus verrucosis; labelli dentibus lateralibus bene evolutis, lamina medianâ cuneato obovato emarginata, baud multum dilatata, calcarî triangulo carnosio solido in basi, onties excavato, lamellis sensim-membranaceis a basi in antecum utriusque uno pari altero anteposito; columna calva (!!) utriusque bidentata. In Venezuela detexit egregius collector Bungeoth. *H. G. Rehb. f.*

dense inflorescence, with well-developed triangular bracts disposed in a bipectinate manner. The flowers are on one side of the inflorescence, and remind one of those of the just-named species. The stalked ovaries are verrucose! This is quite novel. The sepals and petals are the same as in *R. secunda*. Lip cuneate, with one tooth in front of the base on each side, cuneate, obovate, bilobed, with three membranaceous lamellæ on each side, one in front of the other. All those parts are purple in colour. The lip has a rather well-developed, solid, triangular descending spur, hollowed in front. Column quite naked (whereas it is very hairy in *Rodriguezia secunda* and *R. carnea*, and a little so in *Rodriguezia Stangeana*), white, with two teeth on each side of the top. It is a Venezuelan discovery of Mr. Bungeoth, introduced by Messrs. Linden (*L'Horticulture Internationale*), of Brussels. *H. G. Rehb. f.*

CYPRIPEDIUM CALIGARE × n., *hyb.*, hort. *Drewett.*

Take a flower of *Cyripedium Dayanum*, give it the leaves of *Cyripedium venustum*, and you have nearly the plant raised by Mr. Drewett, Riding Mill-on-Tyne, Northumberland, between the dark *Cyripedium Dayanum* as the pollen giver, and *Cyripedium venustum*. The median sepal is that of *Cyripedium Dayanum*, whitish, with twenty-five green nerves. The lateral petals are shorter than the lip, narrow, whitish, with eleven nerves. Petals ligulate acute, bent down, ciliate, white, with a very few green nerves on the lower side, the same on the upper side at the very base. The greater part of the upper part is purple-mauve, with darker nerves. A very dark nerve separates the two halves. There are a few black spots at the base of the dark midnerve, and some (six) larger ones on the upper border towards the base. The plump lip is cinnamon coloured with an ochre border around the mouth. The involute side lobes of the nguis have shining brown warts, and the area between them is covered with light brown spots. The staminode has two roundish side partitions and a small apiculus in the anterior sinus between them. There is an upright reticulation on it, but without any distinct colour. The bract is half as long as the green-stalked hairy ovary, with some rows of small dark spots. The peduncle is reddish-green, with very short hairs. The leaf is nearly like that of *Cyripedium venustum*, as already stated. *H. G. Rehb. f.*

ÆRANTHUS TRICHOPECTRON, n. sp.*

An exceedingly delicate *Æranthus*, introduced by Messrs. H. Low & Co., no doubt from Madagascar and which has just flowered. It is a very delicate, thing, as Mr. Hugh Low observes. The leaves are not rigid, but soft, linear, contracted at the apex, where it is bidentate, 5 inches long by $\frac{1}{4}$ inch in breadth. The solitary white flower has appeared in the axil of a median leaf. It has lanceolate-acute sepals, linear-acuminate petals, a broad lip, nearly cochoid at the base, acuminate at the top, with a long filiform spur, surpassing the length of the ovary five times. The flower, including the spur, is nearly 5 inches. *H. G. Rehb. f.*

CYPRIPEDIUM PAVONINUM × n., *hyb.*, hort. *Drewett.*

You might rack your brains at the sight of this flower, in considering the affinity with *Cyripedium venustum*, *pardianum*, and others. Do not do so. Look to the leaves. They are a span long, unequally bilobed at the top, nearly 2 inches broad, and at the base they have underneath a great number of small red spots and stripes, the remainder being simply green. The median sepal is oblong, blunt, light greenish, with a white border. The nerves are beautiful sepia-brown. There are transverse oblique sepia-brown nervilli at the top between three nerves, and

* *Æranthus trichoplectron*, n. sp.—Tenuis, caule humili; "ad quatuor pollices alto" (etiam altiore), foliis distichis linearibus apice contractis minute bidentatis mollibus; pedunculo unifloro (semper 2); sepalis lanceis acuminatis; tepalibus linearibus acutis, labellon latiori basi acuminato, calcarî filiformi ovarium p-hællatum quinque superante, pollinarîi *Æranthi* sinceris *H. G. Rehb. f.*

some sepia-blackish round blotches at the very base on a yellow area. The lateral sepals form an oblong-acute whitish body, shorter than the lip, with two rows of a few brown spots. Petals ligulate, blunt-acute, broader at the top, a very little undulated on the upper border towards the base, a little ciliate, divided in two halves by a median longitudinal brown line. The upper part (on the developed flower as it stands) is of an elegant brown with a certain hue of purple; from the apex towards the middle the basilar part is light sulphur-coloured, with some larger and some smaller brown spots. The lower part is nearly of the same colour, but much lighter, and the inner part has fewer spots. The outside is very curious in the possession of a wide greenish-yellow disc and brown margins. The lip is rather slender, and comes near that of *C. venustum*, but the nerves are not prominent. It has an ochre-coloured inferior part where there is an ochre margin around the mouth. The whole flower looks as if varnished, and is beautiful. The staminode is very broad, with two teeth at the superior base in the middle, and three teeth in front. The outer teeth are forcipate, antrorse, and the median one is straight. The colour is ochre, with some green nervation. The green bract, with brown-purple spots at the base, is somewhat shorter than the stalked ovary, with stiff reddish hairs. The peduncle is greenish-ochre-coloured, with red hairs.

The pollen parent is *Cyripedium venustum* out of *Cyripedium Boxallii*. It was raised by Mr. Drewett O. Drewett, Riding Mill-on-Tyne, Northumberland. *H. G. Rehb. f.*

PONTHIEVA GRANDIFLORA, n. sp.*

Of the two or three species of *Ponthieva* in cultivation, *P. maculata*, Lindl., is the only one at all commonly seen, and that is more quaint than beautiful. But Mr. Lehmann, whose discoveries in the Andes of Columbia and Ecuador are well enough known to all Orchid growers, sends a beautiful coloured sketch and a specimen of a *Ponthieva* which is, without doubt, the finest known. On seeing the specimen I at once remembered that it was not new to me, and on looking in the British Museum collection I found that it had been obtained in Ecuador by Spruce, but it had never been named or described. It is, Mr. Lehmann tells us, an epiphyte on trees at 2600—2700 metres altitude in the Western Andes of Ecuador. One large leaf, broad ovate and acute, arises from a short stem, like that of a Lily of the Valley, but dull green, and like the rest of the plant, it is covered with hairs; from the base of this rises the scape about 9 inches in length, bearing a raceme of from eight to ten large flowers, not only very curious in structure but beautifully coloured. The two lateral sepals are connate for most of their length, and form a bifid organ 1 inch long and three-quarters of an inch broad. It is white with a green patch at the base. The dorsal sepal is narrow and lanceolate. The petals, which, as in the rest of the genus, are so far adnate to the column, that they appear to arise from the top, are halbert-shaped, and curiously twisted, yellow, with Indian-red stripes. The lip is very small and fleshy, and also appears to be adnate to the column; it is also red.

We may hope ere long to have plants of this curious and beautiful species alive in Europe, and I feel sure it will be welcomed by those Orchid lovers who can admire an exquisite plant even if it is not

* *Ponthieva grandiflora*, n. sp.—Epiphytica: folium erectum ovatum acutum bispidum sex uncias longum, $\frac{1}{2}$ unciam latum, inferne 2—3; vaginae rufescentes bispidæ. Scapus teres 9 uncialis, hispidus vagina singula supra folium. Racemus laxus 8—10 florus. Flores in genere maximi pulchri. Bractee ovate quam pedicelli breviores $\frac{1}{2}$ unciales. Ovarium gracile bispidum unciali. Sepala lateralia pro majore parte connata, apicibus excurvis alba, basis viridia, late oblonga, unciam longa $\frac{1}{2}$ unciam lata, minute pubescentia. Sepalum posticum lanceolatum lineare angustum, $\frac{1}{2}$ unciam longum. Petala columna basi adnata unguiculata, lamina longe triangulari basi auriculata, convoluta $\frac{1}{2}$ uncialia angusta rufa. Labellum basi columnæ adnatum lamina brevissima carnosâ acuta longiformis, rufa. Columna basi tereti, clinandrio profundo. Polliniferæ laete flavae longe pyriformis.—Andes of Ecuador. Lehmann! Spruce! *H. N. Ridley.*

so showy as a *Cattleya Mossiae*. By the way, the same letter that brings this mentions the existence of an *Utricularia* far finer than anything Mr. Lehmann has yet seen. We shall look for this with much anxiety. *H. N. Ridley.*

BEGONIA PRINCESS CLEMENTINE X.

Our illustration (fig. 41) is taken from a photograph sent us by M. Bruant, of Poitiers. It is said to be the result of a cross between *Begonia Rex* fertilised by the pollen of *B. diadema*. The leaves are on long scaly stalks, large, deflexed, of good substance, cordate at the base, roundish-ovate, and dividing at the margin into several sharply pointed lobes. The plant as seen by us at Messrs. Laing's nursery, Forest Hill, has leaves of a bronzy-green above, with a greenish-white irregular band traversing the surface at an average distance of 1 inch from the margin. The under-surface is rose-coloured, with deeper

FIG. 41.—BEGONIA CLEMENTINE X.

coloured ribs, the spaces corresponding to the spots on the under-surface being green, flushed with rose.

We have not seen a large specimen of the plant itself, but, judging from what we have seen and from the photograph, this must be a valuable addition to the list of *Begonias* suitable for the decoration of conservatories and ferneries. We suggest to M. Bruant that, as it is not a species, but an artificially raised hybrid, he should call it by the vernacular name of *Clementine*, and not by the Latin appellation, *Clementine*, which would be calculated to lead to a misapprehension as to its actual nature.

ACACIAS.—Baron Von Mueller's *Iconography of Australian Acacias* proceeds apace. These plants are, as most of our readers know, of great beauty and singularity of form; others are valuable for their timber or for tanning purposes. In Australia they are very numerous, and very difficult of determination, on which account Baron Von Mueller's plates will be the more valuable.

HARDY FERNS IN POTS.

The cultivation of hardy Ferns in pots never seems to have attained as much popularity in the South of England as in the North, and why this should be so appears to me almost inexplicable. It may be that they do not receive sufficient encouragement at the horticultural shows, and as a consequence few opportunities are given to the public of seeing them at their best; he that as it may, they are a class of plants deserving every attention, and capable of affording interest and pleasure to persons having a love for plants in general.

A REPRESENTATIVE COLLECTION

should consist not only of British species and varieties, but should contain a goodly number of hardy exotics; amongst the latter are some of the most beautiful forms, North America furnishing many of

duced other plants, these in their turn throwing out other fronds, and reproducing themselves in like manner, hence the popular name. Of native species there are many none less pretty or remarkable than the foregoing, amongst which may be named *Osmunda regalis* var. *crispata*, *Polystichum lonchitis* (Holly Fern), *Ceterach officinarum*, "rusty back," and innumerable crested varieties of *Athyriums*, *Lastreas*, *Scolopendriums*, and others. Although these plants can be grown in the open air and in frames that kind of treatment is not advocated. To have them in the best possible condition they should be grown in a cool greenhouse, that is to say, one having a north aspect, and not heated by artificial means. The internal arrangements should vary somewhat from those adopted in an ordinary kind of greenhouse, but only in a limited way, and simply to the extent of excluding as much moisture-absorbing material as possible, such as wooden staging and trellises for paths. It would be an additional advantage if the roof were glazed with rolled plate glass of, say, 3-16ths quality, but this is not absolutely necessary, and ordinary glass will do; it is merely a question in the latter case of more shading. The beds, back and front, should be 3 feet 6 inches above the ground level, and surfaced with 2 inches of shingle, the same sort of material being used for the paths, the object being to secure a moist atmosphere in the growing season, and sufficient evaporation to render overhead syrioting unnecessary.

POTTING AND COMPOST.

The plants should be looked over annually, the first potting to take place before the young fronds have made much growth, say, at the end of February or early in March. Old established plants should only receive this one potting in the course of the year. Disentangle the roots with a pointed stick, reduce the balls, and place in the same size pots again; the latter as well as the pots/erds should be perfectly clean, and be supplied with good drainage, over which a layer of moss should be placed. Young plants will require a second, and in some instances a third shift into larger pots, and this should be done before they become pot-bound. Before using new pots take the precaution of soaking them in water. The best compost consists of two parts fibrous loam, one of good peat, one of leaf-mould, and one of coarse silver-sand, with a few broken pieces of charcoal and sandstone added thereto, and which should be prepared and placed under cover a few days previous to use, so that it may not be in too moist a condition. In potting make the soil moderately firm, and water with a rose waterpot once a week. Two or three genera, such as *Hymenophyllum*, *Todea*, and *Trichomanes*, will require different treatment from the general collection. These should be grown in pans and covered with a bell-glass; the compost must also vary to the extent of having all fine soil sifted out, and an extra quantity of broken pieces of stone, cinders, or charcoal added, with increased drainage to prevent stagnation and sourness of soil.

WATERING.

At no period of the year, whether in active growth or in a semi-dormant state, ought these plants to be allowed to get dry. There are few plants that show the ill effects of dryness at the roots more quickly than do Ferns, and they are intensely susceptible to injury from this cause just before the young fronds become fully developed; neglect at this stage of their growth frequently results in irreparable damage. They should therefore, to be on the safe side, be looked over daily—once at the least, and in hot weather twice.

SUMMER TREATMENT.

Next in importance to watering comes that of shading, to a certain extent. Bright sunshine is at all times injurious to the majority of Ferns, and particularly so in the early stages of growth, and when a dry atmosphere prevails inside the house; from March to October they should be closely

the most handsome species. We shall not attempt to give a list, information of this nature being readily obtainable from trade growers who make a speciality of these plants; nevertheless, a few kinds merit special notice. What could be more striking in appearance than that hardy exotic, *Osmunda Claytoniana* (syn. *interrupta*), with its barren fronds, of a rich velvety-green, upwards of 2 feet in length, whilst the fertile fronds are both peculiar and remarkable, owing to the spores being produced between the sterile pinnae attached to the rachis, and which, with age, change in colour from light green to dark brown; or, again, *O. cinnamomea*, which throws up early in the season a cluster of erect-growing fertile fronds, forming a pleasing contrast with the long drooping sterile ones. There is also the "Ostrich-feather Fern," *Struthiopteris germanica*, worthy of a place in the choicest collections. Then we have the appropriately named "Walking Leaf Fern," *Camptosorus rhizophyllus*, a species which forms a crown, and produces long, narrow fronds, from the points of which are pro-

attended to in this respect. Syringing overhead should be discouraged and avoided at all times if possible; atmospheric moisture is necessary, but it ought to be brought about by damping the walls, beds, and paths only, and should be done each day as often as may be required. They should also receive an abundance of air at all times.

WINTER TREATMENT.

When severe weather begins to be experienced the pots should be plunged to the rims in cocoa-nut fibre refuse. The more tender kinds, including all the oriental species, should have their crowns protected either with dry hay or bracken; and from none of the deciduous sorts should the old fronds be cut off before the young ones have made a start.

INSECTS.

Scale is, perhaps, the most troublesome if allowed to get a firm hold. It should be rubbed off with a small stick and the leaf sponged with soapy-water afterwards. Thrips and aphids are more easily dealt with, and may be destroyed by fumigating, but this must be done with care and it will be found much better to fumigate three times on alternate nights, rather than to give one strong dose. *J. Horsfield.*

PLANT NOTES.

CALLIANDRAS.

Two beautiful species of this large genus are now flowering at Kew, the better one being *C. Tweediei*, which flowered at this time last year, again in the autumn, and now once more it is bearing numerous brilliant heads. It is a shrub 5 feet high, with numerous twiggy branches furnished with graceful leaves like those of *Acacia lophantha*, but smaller. The flower-heads are on stalks an inch long, each head being composed of about twenty sessile flowers which are only a quarter of an inch long, the beauty being in the numerous stamens, of which there are forty in each flower; they are $1\frac{3}{4}$ inch long, perfectly straight, threadlike, and brilliant in colour. The flowers are freely produced. Certainly this species deserves to become popular as a flowering plant for the stove in winter. *C. caracasana* is a more robust shrub than the preceding, and it has large oblique leaflets from a half to 1 inch long. The inflorescence is similar in form and size to the above, but the filaments are 2 inches long, white below and rosy-red above. Both species may be seen in the Palm-house. *W.*

RHODODENDRON ARGENTEUM.

This is the first of the Himalayan species to open its flowers in the temperate-house at Kew, and it is one of the largest and most attractive of all. The soft flesh colour of the expanded flowers and deeper tint of the buds give the heads a perfect bouquet-like appearance. [We have a lovely head of *R. Madeni* before us.]

BILLBERGIA DECORA.

This handsome winter-flowering Bromeliad deserves to be more extensively grown. It is indeed, as Mr. Baker remarks, when describing it in the *Botanical Magazine*, t. 6367, "one of the very finest for horticultural purposes." Its rather long and strap-shaped leaves are arranged in the usual rosette manner, and are beautifully marked with scattered, transverse, mealy bands on the back. The chief attraction of the plant, however, lies in the bracts, which are produced along the pendulous stalk of the inflorescence. They are of a beautiful rosy-red colour, in shape oblong, and tapering to both ends; the largest ones are nearly 2 inches wide by 5 long; the lower or bottom ones, longer and narrower, clasping the stem for nearly their entire length—giving it the appearance of being coloured. The large bracts are clustered together towards the base of the spike where the flowers spring, and all but completely envelops them. The flowers cannot by any means be called showy, yet the three

petals comport themselves in a rather curious manner. They are over 2 inches long, sharp-pointed, and green, curling up spirally soon after they expand. The curling is similar to what takes place in the flower-stalk of a Dandelion if it be split. The plant is a free grower, requiring the most commonplace treatment. In fact, any pit or house where there is a fair degree of heat and moisture maintained, is nearly all that it required to enable the plant to make a fresh growth annually, which will flower during the winter. It lasts about six weeks in perfection, and is an object of great beauty during December and January, and the early part of February. *F. Ross.*

BEAUMONTIA GRANDIFLORA.

This is now flowering in the gardens of H. S. Brown, Esq., Digswell House, Welwyn, Herts, in a pot, and carries upwards of 450 flowers, which are bell-shaped, 4 or 5 inches long, thick in texture, and pure white, borne in terminal and axillary corymbs. Such a magnificent plant should be more generally grown than it is at the present time. *John Aining.* (See *Gardeners' Chronicle*, vol. xxv., p. 593.)

FOREIGN CORRESPONDENCE.

L. SPÄTH'S NURSERY, RIXDORF, BERLIN.

NOTWITHSTANDING the fact that this is one of the largest nurseries in the world in regard both to its area and contents, it is comparatively unknown in the United Kingdom. It will, therefore, be of interest to our readers to have some authentic information concerning it, obtained by our representative in Berlin.

Herr L. Späth is descended from an old family of gardeners resident in Berlin, which, so long ago as 1690, possessed a garden in the southern district, on the site of which the Johannes Kirche now stands. In 1758 the business was transferred to the Kopnick Strasse, No. 154, and where at the present day there are some small old-fashioned glasshouses, and a small nursery, founded in 1861.

In the year 1861 H. Späth purchased at Rixdorf a piece of land having an area of 17 morgen (= 10,787 acres), and commenced to lay out a nursery, which has in the course of not quite twenty-five years become one of the largest and best arranged. The extent of land at present under nursery crops is 3336 acres, that is, considerably more than half an English square mile.

The area of this large nursery has been long known to Berlin botanists under the name of the Radower Wiesen, and was of such a swampy nature that even in the month of May it was scarcely firm enough to walk on, but which, owing to the numbers of species of native Orchises that were to be found there, always exercised an attraction to collectors.

By means of open ditches cut in all directions the ground water has been sunk more than 2 feet deeper, and is drawn off and conducted to a brook, and thence to the Treptower Park, a short distance away, where it forms a large lake, the overflow finding its way into the River Spree. And now the shrubs and trees grown in the nursery are as attractive to the botanical student as were formerly the indigenous plants; and the drained sandy soil is found exactly to suit the requirements of the former, and conduce to their perfect development, so that the carefully tended stock cannot be excelled by any others, even in the most favoured climates. The relative perfection of the whole of H. Späth's varieties of fruits, nuts, ornamental trees and shrubs, forest trees, and Conifers, which the climatic conditions permit of cultivation, is due to the fact that in almost all instances the gardeners employed are specialists in some particular branch of nursery work.

The nursery is divided into nine plantations, and each plantation is under the direction of a foreman (*obergärtner*), who works under the supreme directions of the proprietor, and on a certain plan. Each is responsible for his work, and is provided with a permanent staff of trained workmen, over whom he has

the fullest control. With a view to encourage the production of first-class nursery stock, and without undue cost, a commission to each foreman is allowed on the sale of trees, shrubs, &c., from his own plantation. The scale of pay for work performed by the workmen is commensurate with the character of the work to be done. There are on an average 300 to 350 persons employed, and any changes would be as unpleasant for any one of them as for the proprietor, for the majority of the *employés* have been in the business many years—several since its commencement. As a result of these well-conceived arrangements the nursery is enabled to produce more cheaply than are smaller ones, which are not in the position to train, maintain, and find employment for a large body of workmen.

On approaching the nursery a powerful "wind motor" is observed, which pumps the water required for nursery uses. It is of historical interest, it being the first of its kind erected in North Germany, and came from America. H. Späth had seen a similar machine at Count von Moltke's place in Silesia, and, recognising its immense worth to a nurseryman, lost no time in obtaining one. The water finds its way all over the nursery by means of pipes to numerous basins, which, by a simple arrangement needing no supervision, are kept constantly filled. In the neighbourhood of the motor, are two houses, two and three storeys high, for the nursery office staff, the summer dwelling of the proprietor, a steam-boiler house, barns, bulb loft for Hyacinths, and other outbuildings. The before-mentioned steam-boiler generates steam for the heating of five propagating and grafting-houses, having an area of glass of 445 square metres; thirty-seven hotbeds and double frames of 1000 square metres, two laying-in sheds for Roses, Peaches, Apricots, and pot fruit trees, tender seedlings, &c., of 650 square metres; and lastly, two shutter-roofed stages of about 3000 square metres.

An arboretum surrounds H. Späth's dwelling, containing an unrivalled collection, viz., 4176 deciduous shrubs, 667 various Conifers, and 1367 varieties and species of the Rose. Besides these there are numerous trees planted by persons of celebrity who have visited the nursery at various times. Adjoining the arboretum is a piece of land devoted to the cultivation of trained fruit trees. The whole area of the nursery is enclosed by a galvanised iron wire fence, and well tended hedges of Whitethorn, *Cratægus prunifolia*, *Carpinus Betulus*, *Ligustrum vulgare*, *Caragana arborescens*, and *Thuja occidentalis*, 1.50 to 2 metres ($4\frac{1}{2}$ to 6 feet) in height, and very thick. The most striking of the hedges was one composed of *Picea excelsa* (Spruce), 3 metres high, and 0.40 (9 feet by 1 foot 4 inches) broad. Very neat low hedges are formed of *Buxus arborea*, *B. suffruticosa*, *B. Aquifolium*, *B. vulgaris atropurpurea*, *Cydonia japonica*, *Ribes alpinum*, *Spiræa hypericifolia*, and *S. thalictroides*.

In conclusion, we append a few data which will afford some idea of the amount of business done in the packing-shed, and which may be of interest. There are packed daily in the season about 130 bundles for the railways, and twenty-five post packets (parcel post); and further, two men, with the help of a packing-machine, constructed by the proprietor some twenty years ago, pack daily ten to twelve packages of from 3 cwt. to 4 cwt. The consumption of straw in one year amounts to 21,000 bundles, 18,000 bundles of Rushes, 60 cwt. of packing cord, 1500 baskets of different sizes, 50 to 60 waggon-loads of moss, 2000 Russian mats, 20 cwt. of canvas, 10,000 Willow bands for smaller parcels, and 800 boxes and cases. Fifteen horses are employed in transporting goods to the railway stations.

The contents of the nursery at the present time are 200,000 saleable standard fruit trees; 150,000 one-year trained fruit trees; 100,000 grafted ornamental plants, 1,000,000 from seeds; 3,000,000 fruit tree cuttings; 40,000 standard Roses; 150,000 dwarf Roses; 5,000,000 wilding stocks; 10,000,000 seedlings of deciduous bushes; 20,000 standard bush fruits;

35,000 dwarf bushes; 100,000 Conifers from seed, 15,000 grafted.

Of ornamental shrubs worked in the winter there are 20,000 avenue trees; 10,000 one or more years' worked; and 200,000 fit for sale. The quantity of shrub, forest, and fruit tree seed amounts in one year to 300 cwt.

Of great interest is the Pomologen Weg (Pomological Road), of 2000 metres in length, which is planted on either hand with over 5000 kinds of fruit trees. The first row is composed of pyramids, one on the Quince and the other on the Doucin stock; behind these are pyramids on the wilding stocks. The same mode of planting stone and small fruits is observed wherever planted by the sides of roads. A very fine view is obtained from the Pomological Road over the larger part of the nursery. The 914 quarters are nearly all of the same dimensions, and are respectively either of 1000 or 2000 square metres, and each is furnished with an alley, a cart-road, and on two sides there are ditches. By means of the cart-road the quarters are easily approached, and field railways renders easy the transport of trees, manure, &c.

Later we intend to return to this subject, and afford our readers information about some of the special features of the nursery. *Rerlin Correspondent.*

PLANT DISEASES.

PYTHIUM IN IMPATIENS SULTANI.

A FEW weeks ago I noticed that one or two cuttings of *Impatiens Sultani* in an intermediate-house were very weak in the stem a short distance above the soil, and falling over of their own weight. Being aware that Cress seedlings, which showed similar weakness in their stems, were usually affected with the fungus called *Pythium Baryanum*, it occurred to me that the weakness in the Balsam might be due to a like cause. On examination this proved to be the case; the stem at the weak point was very soft and disintegrated, and simply swarming with the *Pythium*, whose mycelium, especially when stained, was readily seen ramifying through the tissues. Whether it is identical with *P. De Baryanum* I cannot, without cultivation, say with certainty; but it seems to agree very closely with undoubted specimens of that species obtained from Cress. The oospores were exceedingly numerous, and in most cases apparently detached from the mycelium, many in the segmented stage figured by Professor H. Marshall Ward (*Quart. Jour. Microsc. Science*, vol. iii., n.s., pl. 13). He states that, unlike some other species, which are very particular as to their hosts, *P. Baryanum* will grow on *Pelargoniums* and other greenhouse plants, as well as Cress; but, so far as my memory serves me, *Impatiens* is not mentioned; moreover, I think all the plants he quotes were artificially infected, whereas it has appeared spontaneously in the Balsam, for there has been no Cress growing in the house for two or three years.

Nurserymen who grow *Impatiens Sultani* largely for trade purposes might, I think, take the hint and eliminate all weakened individuals, as *Pythium* is very infectious, especially in the neighbourhood of water, or in the moist atmosphere of a propagating pit. *Greenwood Pim, M.A., F.L.S.*

ORANGE BLIGHT.

The malady first shows itself in the form of small brown spots on the skin of the fruit, which later on become larger and black; if these are numerous they penetrate and blacken the entire fruit, which is then of an unpleasant black colour. Different species of Oranges are attacked differently. The Sweet Orange, the Lemon, Lime and Mandarin Orange, are most liable; the bitter Orange, the Pampelmouse, and the Chinottier less so. After many observations I arrive at the following conclusions:—

1. The malady is sporadic, and it does not attack uniformly all the plants in a plantation.

2. The evil commences according to the maturity of the different species.

3. A wet season favours the development of the blight, a good season stops its ravages.

I have cultivated the bacteria and inoculated and reproduced the disease. I have taken the bacteria from one species and inoculated another species, and obtained identical results. The bacteria of the black rot of Vines have also been inoculated into Oranges, with exactly the same results. The results from these experiments have been submitted for examination to the Naples Naturalists' Society. *L. Savastano, Portici.*

ACHIMENES AND GESNERAS.

THE many beautiful plants brought together under this heading deserve to be better known amongst gardeners. Almost all are remarkable on account of the great freedom with which they produce their beautiful flowers, their ornamental foliage, and the fact that they flower during the dull winter months. All of the species require exotic treatment, and to this is to be attributed the fact that they are not the most popular amongst cultivated plants. By far the largest number of species have been introduced from South America and the West Indies, where they are found growing in marshy districts. Although a humid atmosphere is most natural to them, they do not flourish under conditions where the foliage is often made moist with the syringe or water-can. When under cultivation, warm, humid surroundings, with immunity, however, from actual overhead wettings, are necessary; but regarding the culture of these plants, it will be best treated of in sections. Large or entire tuberous species, such as *Gesnera Donkelaari*, *Gloxinias*, &c., must be treated differently from those having resting scaly roots, such as *Tydeas*, *Achimenes*, &c. After resting, the stock of either section should be repotted at different periods, commencing about the month of May, and proceeding with intervals of about four weeks between each succession; by this means a number of winter-blooming plants is assured. To follow out this plan, however, a season or two must be occupied in starting them later and later by degrees, so as to bring on this late blooming, particularly in connection with certain early-blooming species, the natural blooming period of which is during the months of June, July, and August. This system of retarding will even be necessary in *Gesnera zebrina*, which otherwise will flower during the month of September.

The proper compost for these plants is a rich porous one, and should be made up of equal parts of turfy peat, fibrous loam, and partially rotten leaf-mould, a moderate quantity of silver-sand being added, and the whole well mixed together. The scaly tubers are best placed several together in a moderate-sized pot, the soil in which should be pressed rather firm, and kept moist.

To make a good start, it is always best to plunge the pots containing them up to the rim in a hot-bed. By this means a good start will be made, and will be continued if conditions favourable to it are maintained. As soon as the young plants have formed two pairs of leaves it will be necessary to pot off each one singly, using large 60's and the same kind of soil as before. The young plants require careful handling so as not to detach the tuber from any one. They are easiest taken out of the first pots by using a short blunt stick. Press the compost down evenly and with moderate firmness, then make a hole in the centre of the compost, and neatly place each plant therein in such manner as to bury the young footstalk about an inch in depth. By this means the latter will push forth more roots than it could do if elevated unduly in the soil. Make firm by moderate pressure, and add a little soil around the plant, and immediately put in a stick for future support.

From this time onward until the blooming stage success will depend on maintaining heat up to a maximum of 80°, with sufficient attendant humidity, bottom-heat up to 90° being likewise an important aid, with fresh air occasionally, and as much light as

possible short of full sunshine, which, if powerful, is injurious.

Tydeas and *Negelias*, *Eucodonia* and *Gesneras* of the zebrina type, require a somewhat deep soil, and should therefore, if single, be bloomed in 32's, but three or five plants may be bloomed in a 24. On the other hand, *Plectopomas*, *Achimenes*, *Chiritas*, *Cyrtodeiras*, and *Stenogastras* are best grown in pans, a shallow soil suiting them best. Whether pans or pots be used, it is important to give good drainage, and for this reason, that they delight in waterings frequently given whilst growing, but are nevertheless injured by a waterlogged soil. Though general suggestions concerning potting this section have been given it may be well to add, that the five last, excepting *Chiritas*, will succeed better when double the amount of leaf-mould is used in the compost, and the soil pressed much less firmly than is desirable for those previously noted.

Tuberous *Gesneras*, of which *G. Cooperi*, with its unusually large tubers, is a type, succeed best when they are potted firmly into a compost consisting of three parts peat, one part good yellow loam, with about a sixth part of each of the following materials—leaf-mould, burnt earth, and silver-sand. It is important, moreover, not to use pots of too large a size, but to give the plants two shifts instead of one at the time of starting into growth, and the other when the first two pairs of leaves are forming, and growth is active. To the application of moderate bottom-heat during the active growth much success is due. As the roots are not numerous it is a good plan to stand the pots upon a board placed immediately over hot-water pipes; this tends to cause the production of more roots, and to maintain the soil when frequently watered—which under such conditions is necessary—in an excellent condition. Artificial heat in any form is desirable, though if the pots be plunged in damp materials the invigorating action of frequent watering of the soil cannot be afforded the plants.

The propagation of these plants, though easy and simple enough as regards *Achimenes* and similarly rooted *Gesneras*, is more difficult in some others. All will strike more or less readily from moderately matured young shoots dibbled into very sandy soil and properly attended to. *Gloxinias* strike freely enough both from young shoots and from matured leaves put into sandy soil, soon forming tubers.

An important item of culture does not receive the amount of attention it deserves—I refer to the proper maturing of the tubers after flowering. At such a time it is a common practice to put the plants on one side and take little heed of them, whereas well developed tubers that will reproduce robust plants in the future can only be secured by attending to the matter of watering, airing, &c., for so long a period as the foliage remains green. The contrary practice results in miserably small tubers. When the plants have matured, and have died down, although it is desirable to keep the soil in the pots moderately dry subsequently, care must be taken not to place them too near to flues or hot-water pipes, &c.; indeed any position in a warm greenhouse or stove the farthest removed from the means of heating is the best.

The following are the best varieties for ordinary gardens:—

Tuberous-rooted Gesneras.—*Donkelaari*, bright vermilion colour; *Duvallii*, dark red; *macrantha*, purplish-red; *magnifica*, bright crimson; *Cooperi*, bright scarlet.

Deciduous Herbaceous Gesneras (with scaly tubers).—*Cinnabarina*, cinnabar-red, light throat; *exoniensis*, orange-scarlet, yellow throat; *refulgens*, vermilion-crimson; *zebrina*, scarlet-yellow spotted; *z. splendens*, bright scarlet and spotted; *Leopoldi* (nine varieties), various coloured; *regalis*, vermilion; *Hon. Mrs. Fox Strangeways*, nankeen with red; *Lindleyi*, rosy-pink, yellow and red; *chromatella*, rich yellow; *Barlowi*, salmon-spotted.

Hybrid Gesneras as Negelias.—A beautiful divergence from previous types, yet retaining therewith all that is desirable in foliage and flowers, and requiring

treatment midway between what is suitable for Achimenes and Gloxinias, especially in the matter of potting compost, or the moderate free use of leaf-mould. *N. de Prodigue*, rosy-purple and salmon, fringed; *N. Mont Blanc*, lovely white; *N. pyramidal*, rosy-purple, yellow throat; *N. Madame Heine*, rich purple-shaded rose, &c.; *N. Madame Jehenne*, violet colour, Achimenes shape.

Other varieties, such as *G. n. Raphael*, *Chardin*, *Monsieur David*, *Claude Lorraine*, and *Fabiola*, existing in our nurseries, afford fine additions, to which may now be added some forty other varieties in the hands of Continental growers, the finest of which, it is to be hoped, will be shortly distributed here.

PLECTOPOMA.

In hybrid *Plectopomas* we have another extremely interesting and beautiful class. Unlike plants of the *Nægelia* type of hybrids, with their bold pyramidal spikes, *Plectopomas* produce mainly single blooms only, placed on compact stalks issuing from the axils of the leaves, the flowers, *Gloxinia*-shaped, being very large, showy, and beautifully marked. Some varieties of *Plectopoma* and *Nægelia* display beautiful foliage, for which alone they are worth growing. Continental growers have named between twenty to thirty desirable varieties, and among them *P. nægeloides candida*, white, pale yellow throat; *P. Alfred Lasere*, bright rose; *P. bicolor*, citron, spotted yellow; *P. triumphans*, lilac, freckled with amaranth; *P. corallinum*, coral-red, yellow blotch; *P. Great Eastern*, bright rose and carmine.

ECCODONIAS.

This is another attractive class, in form midway between *Gloxinias* and *Tydeas*. The following varieties are desirable:—*E. Ehrenbergii*, blue, white throat; *E. nægeloides*, rose, citron-yellow throat; *E. Houttei*, carmine and white; *E. n. lilacina*, marbled lilac; *E. nana multiflora*, amaranth and gold.

Achimenes and *Gloxinias* are too well known to require lists of varieties in this place, though the newer varieties of the latter introduced during the last two years should be in the hands of all growers, as they are such a great advance on older forms. Two new forms of *Gloxinia*, named respectively *G. insignis*, bluish-lilac coloured, winter blooming, and *G. maculatum scyptum*, producing terminal inflorescence some 18 inches in length, upon which individual lilac-coloured blooms are well displayed.

Gesnerworts are not, however, exhausted; there are the pretty foliaged *Hypocyrtia*, *Köhleria*, *Kollikeria*, *Drymonia*, and the botanically singular one-leaved *Streptocarpus*, not to speak of flowering forms, such as *Locheria*, *Scheeria*, *Sciadocalyx*, *Columnnea*, and the fragrant-flowered *Dolichodeira*—all of which are found here and there, and afford much interest in stoves and other plant-houses. *William Earley, Ilford.*

ORCHID NOTES AND GLEANINGS.

DENDROBIUM WARDIANUM LOWIE.

A FEW weeks ago a writer, having observed a plant in flower of this lovely Orchid during the month of November, spoke of it as a creditable achievement; and once or twice recently this species, with *D. nobile* and one or two others, have been recommended as being quite amenable to a course of treatment by which flowers may be obtained on several batches of plants during the winter and early spring months. Certainly this is a most desirable end to have in view, and if in any way our methods and management can be so adapted, and the plants so comport themselves to our treatment, that they can safely be obtained—that is, perfectly satisfactory results in point of flowering, without loss of vigour to the plants themselves—by all means let the method be put in practice. But if it be remarked that this species is not sufficiently free to bloom, the flowers lacking size and colour when blooming early, and also

that there is a lessening of vigour, with a prospect of the loss of the plant, then I think it would be better not to attempt so much with this fine form, and that it is much more advisable to wait a couple of months at least, so that by the middle or end of February—which is quite early enough—stout bulbs may produce finely-formed flowers, which I venture to say will be quite as welcome as the generally colourless flowers which are likely to be produced before Christmas. "Oh! but," the answer comes, "we have batches of a score which we so manage that they mature and ripen their bulbs early in the autumn, and then are put into a cool house, and afterwards gradually brought into heat, and so flower early; the other batches are also thus successively treated, and thus the blooming period is made to last four or five months—say from December to April or May." Now I should much like to know whether there are half-a-dozen Orchid establishments in the United Kingdom where there are a dozen or a score plants now in flower, or just about to burst their blooms, that have been treated to a course of culture by which these special dozen or score have always finished their growth, shown flower, and bloomed first, and to-day have their flowering bulbs in all respects as stout and satisfactory as those that were made the first season after the plants were imported. I would not be too severe, but I question whether there are six such collections that have year after year done so, or that have for six, or five, or even four years managed thus with this species. If it were so we should sometimes see much finer plants, always increasing in size; instead of this we too often meet with weak attenuated growths, which are gradually getting less.

That *D. nobile* may be managed in this manner I quite admit, or small plants in baskets are grown and planted year after year for long periods, and gradually increase in size and vigour. Even *D. crassinode* can be managed in this manner; though not flowering so early as *D. nobile*, still it can be kept and shown in June.

But *D. Wardianum* would seem to resent this treatment, and though perfectly satisfactory results can be secured by good growth and good rest in a general way, too much hastening or retarding assuredly will work harm and bring about loss. Probably more plants of this species have been lost during the last twelve years through bad management than any other Orchid, with the exception of *Epidendrum vitellinum majus*. The numbers of this latter, imported and grown in a couple of years, then dwindling away, and ultimately lost, has been surprisingly great.

When *D. nobile* has made its growth and is put by to rest, it will remain dormant, so far as growth is concerned, for weeks and months; but there would seem to be a disposition in *D. Wardianum* to start again into growth almost before the last bulb has perfectly developed its growths. In this respect I have often been struck by the probable fact that *D. Wardianum* is a natural hybrid, having *D. chrysanthum* originally as one of its parents, with perhaps *D. nobile* as the other. If the flower is carefully looked at, the characteristics of each assumed parent are present—the shiny appearance of the flower, the purple spots in the lips, &c. I know the flowers of *D. Wardianum* are much finer than those of either of those mentioned, but then it is characteristic of hybrids to develop finer proportions than the parents. Look again at the growth of *D. chrysanthum* and *D. Wardianum*—I mean the manner in which the new growths push away from the old ones, the single stem running along, rather than the base of the bulbs assuming a mass or clump of bulbs. In this respect it would seem much to resemble *D. chrysanthum*; and then again the latter, flowering naturally in August and September, is ready to recommence growth by November or December, as we find it will do. This may only be conjecture now, but some day we may see whether such a result can be brought about, for in fertilising and raising *Dendrobiums* there is quite as large a field for experiments as it has already been discovered there is with *Cypripediums*.

However, I would advise those who have a fair stock of *D. Wardianum* not to be in too great a hurry to push them into flower; the days are short, the light is insufficient, and but few flowers will reward their efforts. But where the plants are comparatively dormant, keep them dry and cool for some weeks yet, then they may be gradually placed in heat and moisture, and a more effective display will be made, but not over so long a period.

I remember once seeing some large and well grown plants of this *Dendrobium* at F. Yates, Esq., Feniscowles, near Blackburn. A number of these were disposed of, one large plant going to a famous collection in Cheshire. This identical plant was shown once afterwards at Old Trafford, Manchester; but then its showing days ceased, and I doubt much if it, or any portion of it, has the vigour it possessed when it passed from Lancashire into Cheshire. *Vanda.*

CATILEYA WALKERIANA.

This species, also known as *C. bulbosa*, is noteworthy on account of the unusual manner in which it produces its flowers. Instead of bearing them, like other *Cattleyas*, from the apex of its ordinary pseudobulb, the latter remains barren, and a small leafless offshoot from its base is devoted to that purpose. This floriferous growth does not show itself until the pseudobulb proper has completed its growth, and usually consists of little more than a few elongated scales. The flower, which is of good substance, measures 3 or 4 inches across, and is of a bright rose colour, the lip being of a deeper shade, and having a dull yellowish patch on the centre. A plant is now flowering in the Kew collection. The variety *dolosa*, a plant of which has also lately flowered at Kew, differs considerably from the type, and, until the publication of Messrs. Veitch's *Manual*, ranked as a species. Its flowers are produced from fully developed pseudobulbs, and in colour more nearly approach magenta. It is marked also by the greater development of the side lobes of the lip, which meet over the column. A good portrait of this variety is given in the *Gardeners' Chronicle* of April 1, 1876. Neither of these Orchids are free-flowering, and more especially is this the case with *C. dolosa*. The two plants mentioned above were kept during their last resting period with the cool *Odontoglossums*. In this position it was possible to keep them from shrivelling with much less water than in ordinary *Cattleya*-house temperature, and it is probable that the more complete rest thus obtained had much to do with their subsequent flowering.

ODONTOGLOSSUM URO-SKINNERI.

Sepals and petals oblong, rosy-purple spotted; lip cordate, transversely oblong, white, thickly beset with rosy-pink markings. *Lindenia*, t. 122.

CYPRIPEDIUM ARTHURIANUM VAR. PALLIDUM.

A cross between *C. insigne* and *Fairreanum*. Upper sepal broadly ovate acute, white, with purplish-red stripes; petals deflexed, white, with reddish veins; lip pocket-shaped, purplish, shining. *Lindenia*, t. 121.

FRUITING OF BRUGMANSIA LUTEA.

THE *Daturas* (*Brugmansias*) of the perennial section are seldom found to bear fruits under cultivation in this country, the conditions probably under which they are grown, or the absence of the particular insect or small bird which aids the fertilisation, being absent. Mr. O. Thomas, of Chatsworth Gardens, Chesterfield, says, in the note accompanying the pod now figured (see p. 269), that he had not previously observed the plant in seed, but this year it bore several seed-pods which ripened perfectly. The pods contain numerous seeds of a wedge-like form, dark brown in colour, rough, with minute granular bodies on the surface. *Brugmansia lutea* is a yellow-flowered greenhouse shrub, attaining, when planted out, a height of 20 feet. A showy plant when in flower in September.

CULTURAL MEMORANDA.

CALADIUMS.

THESE are easily-managed plants, and from their fine habit and beautifully variegated and richly-spotted leaves, are great favourites both for effect in

growths that are sent up from the crown of the bulbs when they commence to grow about this time of year. These growths, when 3 or 4 inches long, emit roots from their bases, and at this point they should be detached by a clean cut, potted singly into 3-inch pots in a mixture of good fibry loam and sifted manure from an old hotbed, with a good dash of

perature of 65°, and 15° or 20° higher by sun-heat, and they should be kept well supplied with water while growing.

GARDENIAS.

Plants in pots, which are now swelling their flower-buds, will be benefited by being top-dressed with a little of Beeson's manure, followed by a mixture of sandy loam and leaf-soil about one part of the latter to three of the former, with the result that finer blooms than could otherwise be obtained will be secured. The plants should have a night temperature of from 65° to 70° and a humid atmosphere, raising the temperature up to 85° or 90° with sun-heat at closing time, early in the afternoon, syringing the plants well overhead with water of the same temperature as that of the house at the same time.

BEGONIA REX AND ITS ALLIES.

These fine-foliaged Begonias are not so extensively cultivated as they were some twenty years ago. A stock of plants is easily worked by cutting the leaves into pieces a couple of inches square and inserting them edgewise in small pots filled with light mould, with a little sand on the top. Give a little water through a fine rose, place in heat, and in due time the young plants will appear, when they should be potted singly into small 60-size pots in a mixture of light loam and leaf-mould, with a sprinkling of sharp sand added, put back into heat and watered, afterwards shifting the plants into 4½ inch and 6 inch pots. Plants may also be readily raised by laying the entire leaf flat on the surface of the sand with the inch of stem attached inserted therein, and making a slight cut at junctures of veins in the leaf, and placing a few small stones on them to keep the leaves in contact with the sand. Propagation may also be secured by division.

BOUVARDIAS.

If the old plants which have been at rest during the last couple of months be now cut back pretty hard and put into a forcing-house they will soon push into growth. The young growths, having a couple of joints each, should be taken off and put into small pots filled with a mixture of three parts light loam and one of leaf-mould and sand, watered and placed in heat, when they will soon root, and should be potted off singly in small pots, put back in heat, and watered. Afterwards they should have the shoots pinched, giving them more room at the roots in due time, and admitting more air to them as the plants increase; and as the weather becomes warmer, keep them well supplied with water. H. W. Ward.

COLONIAL NOTES.

NOVA SCOTIA.

MR. PETER JACK, cashier of the People's Bank of Halifax, Nova Scotia, who passed away on February 8, at the age of sixty-two, was an ardent horticulturist, and known to many plant growers and botanists in Britain as well as in Nova Scotia. Born at Leven, in Fife, and educated at the Dundee Academy, he entered the service of the National Bank of Scotland at an early age. He was for some years in the chief office in St. Andrew's Square, Edinburgh, under the direction of the late Mr. Anderson, father of the late well-known botanist, Dr. Thomas Anderson, who was for some time superintendent of the Calcutta Botanic Garden, and of Dr. John Anderson, who has long occupied prominent scientific positions in India. Mr. Jack dated his first interest in plants to a commission entrusted to him when in the bank at Glasgow to procure an "old man" Cactus for his young friend, Tom Anderson, then at school in Edinburgh; this must have been about forty years ago. The plant with a flat stick in the pot bearing the ominous inscription, "Cactus senilis," was purchased at the Glasgow Botanic Garden for 6s., and duly forwarded by rail to Edinburgh.

When in Glasgow Mr. Jack attended college classes, devoting his attention chiefly to metaphysics.

FIG. 42.—POD OF BRUGMANSIA LUTEA, WITH SEED. (SEE P. 268.)

the stove and for furnishing purposes during the summer and autumn months. The old *C. argyrites* is still—although there are about 300 varieties of the Caladium cultivated at the present time—the most dwarfly growing and useful plant of its class for decorative purposes, namely, for the edging of groups and stages in plant-houses, intermixed with small plants of Maidenhair Fern and *Isolepis gracilis*. The Caladium is increased by division of the young

sand added; place in a propagating pit or hotbed, water, and shade from sunshine until the roots have pushed into the soil, when they should be gradually inured to light, and be placed on a shelf near the glass in a stove or forcing-house, afterwards shifting them into larger pots as they require them; 4½ and 6-inch pots will be large enough for plants specially intended for furnishing purposes. The plants grow freely in a moist atmosphere, and a night tem-

After spending several years at the Bank's branches in Oban and Glasgow he transferred his services to the Bank of British North America, and was sent out to Montreal, at or about the same time as Mr. King, now in London, who afterwards became manager of the Bank of Montreal, the greatest financial institution of the country. Mr. Jack was soon promoted to the position of accountant of the Halifax branch of the Bank of British North America, and removing to Halifax, he occupied this position till 1864, when the People's Bank of Halifax was proposed. He was invited to organise and take office as cashier of the new institution. He continued to discharge his duties in the People's Bank for nearly twenty-four years, until December last, when overtaken by his fatal illness.

Mr. Jack was a keen horticulturist and Fern grower, and spent his leisure hours in summer time in planting and improving the picturesque grounds around "Bellahill," his summer residence, 12 miles from the city of Halifax. At this beautiful place he was ever ready to receive his friends, and many officers of Her Majesty's Navy, who have been on the West India station (the ships spend the summer season at Halifax), and other strangers, have pleasant reminiscences of the delightful spot and its surroundings in the Sackville Valley. A series of very fine photographic views taken there by Lieut. Gladstone, R.N., was exhibited by Mr. Jack at the recent Indian and Colonial Exhibition in London.

Mr. Jack's ornamental grounds at Bellahill were formed without much labour or expense, simply by preserving the native trees, thinning out and pruning where required, cutting brush, levelling and laying out paths where opportunity offered; trees of kinds not already on the ground were planted in open spaces, or where shelter was needed, especially Conifers, of which he had a fine collection. The principal native trees in his grounds are evergreen Conifers, the Sugar Maple, Birches, American Beech, American Ash, with smaller bush trees, such as Thorns, Amelanchier, and Alder. The native Conifers are chiefly the White Pine (*Pinus Strobus*), Hemlock Spruce, Balsam Fir (a short-lived tree), and the two glaucous Spruces, *Picea nigra* and *P. alba*. Of the latter there were many fine specimens in the grounds—native trees that had for years been encouraged to growth simply by removal of contiguous trees, and other judicious care. The planted trees and shrubs were numerous—Austrian Pines, Cedars, *Retinosporas*, Maples, Weeping Caraganas, Willows, Ash, &c. One Camperdown Elm is just about the shape and size of the original tree at Camperdown House.

The following return of the condition of the trees on his property was furnished by Mr. Jack last spring for the Government crop report, indicating the peculiar effects of the previous winter:—

"Trees that had stood many previous winters, succumbed to the severity of last. A fine tree of *Retinospora pisifera*, which had scarcely ever been touched for the previous ten years, was nearly destroyed. *R. plumosa* and var. *aurea* were also very much injured. *Pinus ponderosa*, which had thriven for several winters, was cut down to its lowest branches. *Picea Menziesii* was cut down to the snow line, and so were other trees from the Pacific slope of the Rocky Mountains. The spring was cold. There were several severe frosts in June—one in particular on the night of the 14th and 15th, which destroyed the leaves of *Magnolia acuminata*, those of the native Ash and Oak, and the fronds of many of our native Ferns, whilst the foliage of the European Ash (*Fraxinus excelsior*) was untouched. The Irish Juniper and *Cupressus nutkaensis* stood the winter very well indeed. *Yucca filamentosa* is again in flower in my garden, the second time it has flowered in Nova Scotia, although it flowers freely in England. *Picea Strobus* var. *albescens*, a new variety found in the woods, is thriving."

Mr. Jack was very successful as a Rose grower. His flower-garden lawns were kept with the greatest neatness. He had also large borders of herbaceous plants, his collections receiving valuable additions of late years from correspondents in England, including

Mr. Harmer, of Cringleford (Norfolk), whose acquaintance he made accidentally on Montreal Mountain, when they met botanically at the time of the Montreal meeting of the British Association. Mr. Jack's collection of Ferns embraced all the hardy species that could be obtained, and included most of the British species, some of which, however, such as *Lastrea fenisecii*, from Arran, did not stand our climate, although the allied but quite distinct species with which it was long confounded, *dilatata* and *spinulosa*, are as hardy as possible. Some years ago, Mr. Jack found *Lastrea Goldieana* and *Scelopendrium vulgare* at Woodstock in New Brunswick; they had not been known before in the maritime provinces of Canada.

Mr. Jack was President of the Game and Island Fisheries Protection Society, a member of the Board of Governors of Dalhousie University, and Chairman of the Finance Committee of that Institution. He took interest in the other literary, scientific, and benevolent institutions of the city and province, and especially in the public garden of Halifax, a garden not excelled for beauty in North America, and fairly large for the size of the city. *G. L., Halifax.*

JAMAICA.

The last number of the *Bulletin* of the Botanical Department of Jamaica contains a list of timber and shade trees cultivated in the gardens and available for planting in tropical countries generally. Mr. Labonadière's treatise on Coffee planting is continued; a Government proclamation is issued forbidding the importation into Jamaica of "seeds or plants or any description of earth or soil, or any article packed therein that may have come either directly or indirectly from either of the following countries:—Natal, South India, Ceylon, Java, and Fiji." This probably is intended to prevent the importation of the Coffee fungus (*Hemileia*).

TRINIDAD.

The January *Bulletin* of the Botanical Department contains an interesting article on the Central American Rubber (*Castilloa elastica*), which has been introduced into Trinidad, and gives promise of being a valuable source of revenue. In Honduras Mr. Morris speaks of the tree as yielding a safe and sure return as a caoutchouc producer, in addition to being a valuable nurse-tree, and useful for shade and shelter. Mr. Hart adds some particulars as to the best method of planting the tree: a moist climate and an equable warm temperature are requisite.

PLANTS AND THEIR CULTURE.

FERNS.—Whether for cutting purposes or as decorative subjects a plentiful supply of the kinds required should be maintained. The quickest and easiest method of keeping up the supply is to make periodical sowings of "spores." These, if their few wants be attended to, soon germinate, and in many instances new forms are produced. Collect from the old plants fronds which have plenty of fruit (sori) on them, lay them out thinly on a piece of paper, and put them in a warm dry place. This will cause the fruit cases (sporangia) to burst open, liberating the spores. As the spores are very minute and extremely light the least puff of air would scatter them. Therefore, do not bring any strong growing species near to where the spores are being collected, as in all probability they would become mixed, and as the stronger growing sorts would likely be the first to germinate, they would thus, having possession of the soil, prevent the weaker spores from developing, and the resulting crop of plants would be something different from what was expected. Having obtained the spores, fill either pots or pans three quarters with drainage, which cover with a thin layer of sphagnum moss or peat fibre, filling up to about half an inch below the rim with rather fine peat and sand in equal proportions, and finish by giving a thorough watering with boiling water. This usually kills any spores of fungi or other plants already in the soil. After the soil has become sufficiently cooled sow the spores, and plunge them in a close propagating frame, taking care not to water them overhead until the prothallia are well up. Should a convenient frame be not at hand cover the pots with pieces of glass, and stand them in saucers filled with water. These, if placed

on a shelf where a temperature of not less than 60° is kept up, will do equally as well as those placed in a frame. It is essential that, although they are not to be watered overhead, they must never be permitted to become in the least degree dry, nor should any more shading be used than is actually required to prevent the sun from scorching them, and in every stage they must be kept as near to the glass as possible. The spores usually germinate in from three to five weeks, and as soon as they are large enough to be moved in little clumps they should be transferred to shallow pans filled with soil similar to that recommended for sowing the spores. See that the soil used, as well as the soil about the seedlings, is fairly moist as it is injurious to resort to heavy waterings until the young plants have shown signs of making a frond, which will be a signal that they have passed the first stage of their existence, and are now young Ferns. Should watering be required, do so very lightly (of course it may be frequently) with the finest spray possible with a syringe.

Clivias and Cyrtanthus.—These useful spring-flowering plants are easily forced into flower, and where a sufficient number of plants are grown they may be easily had in flower from December to May by introducing a few from time to time into a little higher temperature than that the stock is kept in. They are splendid subjects for conservatory decoration; their warm-coloured flowers and graceful foliage rendering them very effective. Should any of them want potting, or if it be desired to increase the stock, it may be done previously to starting them. They delight in a rich loamy soil, of a fairly retentive character—indeed, *Cyrtanthus* rarely make much progress unless the soil is of this nature. It is all the better if some crushed bones or ground coprolites be added to the compost, especially the latter, as there are some valuable elements of plant food in these which are not found in some other manures. Drain the pots well, as the plants require abundance of water during the growing season. Of *Clivias* there are now many beautiful hybrids of the *miniata* type, producing large heads of flowers; they vary in colour between orange-flame and orange-scarlet. *Clivia cyrtanthiflora*, *Gardenii*, and *nobilis* are the best. In *Cyrtanthus* there is more diversity of colour, *C. lutescens* being yellow, *Macowani* reddish-scarlet, *C. Mackenii* white; and there are some new hybrids which bid fair to become useful decorative plants.

Cuttings.—The present is a good time to put in cuttings of many of the winter-flowering plants, such as *Libonias floribunda* and *penrhosiensis*, *Sericographis* of sorts, *Centropogon Luyannii*, the handsome *Callicarpa purpurea*, and similar things. Select stout and goodly-sized cuttings in all cases; indeed, with *Libonias* the best results are attained by putting in nice bushy pieces, which require but little subsequent pinching to make dense bushy plants.

Seeds of stove and greenhouse plants should now be sown, such as *Abutilons*, *Acacias*, *Grevillea robusta*, *Fatsia (Aralia) japonica*, and *F. papyrifera* (the Rice-paper plant), *Mimosa pudica*, and *Desmodium gyrans* are always objects of interest in a collection of plants. Such pretty trailing plants as *Thunbergia alata*, *Clitoria ternata*, and *Maurandya Barclayana* should not be forgotten; they come in handy for twining round pillars, or as large basket plants. A good sowing of *Gomphrena globosa* put in at the present time will come in for decorative work during summer. In the earlier stages of the plants' growth a genial warmth is necessary, and nothing suits them better than a hot dugbed. As soon as the seedlings are fit to handle, prick them out in pans, using a light, rich soil; return them to their former quarters, and when about 3 or 4 inches high they should then be potted into their flowering pots. If single plants are to be grown 48's will be large enough, but large specimens may be made by putting three plants into large 32's or 24's, and as the days lengthen gradually dispense with fire-heat; but a moderate temperature should be kept up until such time as the flowers are showing. Cockscombs require pretty much the same kind of treatment, but it is better not to use rich soil till after the flowerheads are set, after which it cannot well be too rich. I have seen plants sown at this time of year develop to 36 inches by 18 inches by the autumn. The pots must be of a good size if large specimens are desired.

Rondeletia speciosa major.—Plants which were pruned back during winter will now be breaking, and may be treated in the same manner as *Francisceas*, but a little peat or leaf-mould added to the potting compost is beneficial. This plant makes a handsome

specimen when furnished with growths to the base. For shape, the round-headed or cone is much liked, when well furnished.

THE FLOWER GARDEN.

PROPAGATION.—The next two months will be a busy time in this department, and before beginning an approximate calculation should be made of the numbers required of each kind of plant. To ensure the quick rooting of cuttings they should be clean, healthy, and thrifty, and, broadly speaking, preference should be given for those of medium strength. It is also essential that after they are inserted in the pots they should not flag from any cause, as to permit this to happen means courting failure, or at best only partial success. The matters of drainage and temperature are also of importance. Most of the soft-wooded bedding-out plants root freely in a temperature of 70°, with a heat beneath them 10° higher. When 6-inch pots are employed they may be made up as follows:—Place an inverted thumb-pot over the hole, fill to the same level with small potsherds, over which put a layer of moss, then fill in with sandy compost to within half an inch of the rims, and a thin layer of sharp sand on the top, and press down moderately firm. This plan, although the one in general practice, is not, in my opinion, the best or most economical in the long run, owing to the subsequent potting or boxing off that is necessary. My own practice is to make use of shallow boxes, 20 by 14 inches, and 4 inches deep; in these the cuttings remain until planting-out time arrives, and are made up with such a compost as will ensure continuous growths up to that period. A layer of 2 inches is put at the bottom of rough pieces of turfy loam and well decayed manure in equal proportions, over this 1 inch of finely sifted compost, a thin layer of sand finishing off the surface. The cuttings are put in thinly—100 in a box—watered with tepid water, covered with panes of glass, and placed on the hot-water pipes in ainery at work, care being taken to allow sufficient ventilation for the evaporated moisture to escape during the first few days, and to shade with paper when it is necessary. As soon as they are rooted they are gradually introduced to air and light, moved to another part of the house, after a time to a colder one, and finally to cold frames to get hardened off. When properly attended to in this way, the losses do not amount to more than 5 per cent. Most of the subjects employed to fill the summer beds will do fairly well under this treatment in hotbeds, but more care and watchfulness will be required in ventilating and shading *Gnaphaliums*, *Verbenas*, *Ageratums*, *Königas*, and *Tropæolums*, and *vice versa*, when a propagating-house constructed on proper principles is employed. *Cannas*, *Lobelia cardinalis*, and *Dahlias*, are best propagated by division of the old roots after growth has begun. The last named may also be easily increased by cuttings inserted singly in thumb-pots and plunged in bottom-heat. The general collections of these may now be placed in a temperature of 55° to 60°. Examine the tubers and cut out all decayed parts. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

PINES.—Any of the winter-started Pines which are showing colour should be kept dry. It is no uncommon thing for Pines when they approach the colouring stage to lose their roots. Most of the plants which were specially treated in the beginning of January will now have bloomed, and should receive a good syringing of tepid water to clean the foliage. It will be necessary to support the fruit; this should be done in good time, ere the weight of the fruit sways the footstalk off the perpendicular. For this purpose two sticks are necessary. Use good Hazel rods; if they have been cut twelve months previously so much the better. When inserting these in the ball be careful not to run them down between the pot and the ball, as nearly all the roots are coiled round the outside of the ball, and serious injury would result. A tie to each stick below and above the fruit will be requisite to maintain the fruit upright. Let the night temperature read from 70° to 75° according to the state of the weather. If very stormy a drop to 65° will be better than a violent heat;

when the temperature rises to 85° with sun-heat let a little air be admitted and gradually increased till mid-day, when it should be reduced by degrees, shutting up in time to secure a temperature of 90°—95°. Well damp the surface of the bed, paths, and walls. Examine the plants weekly, and give as much weak guano-water at the same temperature as the plunging bed, and moisten the whole ball, taking care at the same time not to splash it over the foliage. Another selection of the most forward stock may now be made for a third succession; choose those which have well filled their pots with roots, and subject them to a temperature of 90° at the root and 65°—70° at night; see they are not over-dry at the root at the time of plunging, else they will throw up weak fruit. The late stormy weather will have prevented the shifting of the general stock, but no time should now be lost. Any plants which were shifted at the beginning of last month may now be watered, but caution is requisite at this early season just to give what is necessary and no more. The sun, when it does shine this month, is generally very bright, and it may be necessary to place some light shading over newly potted plants and rootless suckers during the brightest part of the day. Plants which were placed in their fruiting pots last September and October should be encouraged to make a rapid growth now with the view of resting them during the month of May, when they will be easily started into fruit during the following month; take advantage of bright days to push those forward, shutting up in good time to secure all the solar heat possible. Maintain a night temperature of 65° to 70°. Do not syringe overhead at present as the water lodges in the axils of the leaves and is productive of suckers; damp all available surfaces, and keep the vapour trays constantly full of weak guano-water.

Vines.—Pot Vines which were started in November, and are now in the second swelling should receive abundance of weak manure-water; when they begin to colour this should be discontinued, else the flavour will be deteriorated. Do not pinch the lateral shoots more than can be helped; rather encourage leaf development, as it will improve the size and colour of the fruit. If red-spider make its appearance, resort must be had to hand-sponging, as the slightest injury to the foliage will check the swelling of the fruit. Take advantage of bright sunny days to forward the crop, but do not insist on too high a night temperature, and during cold nights be content with 65°, but during mild weather 10° higher may be given. Thin all free-setting Vines as soon as possible, and attend to pinching, bearing in mind that good healthy main leaves are preferable to any lateral growth. As soon as the bunches are all thinned, if the border is at all dry, let a thorough soaking of weak guano-water be given at a temperature of 85°, and mulch the border with a few inches of horse-droppings to prevent a sodden surface from frequent sprinkling of the borders; place a little soot and guano in the vapour troughs once a week and fill the same up with water daily. Admit a little fresh air on all favourable nights more or less according to the state of the weather; where there is no hurry in ripening the crop 60° for most varieties, and 65° for Muscats will be sufficient as a night temperature. Disbud succession-houses as soon as the shoots are 1 inch in length, and discontinue syringing the Vines. Keep the shoots clear of the glass as growth proceeds. Do not trouble about getting the shoots into position, as this often results in their dropping off altogether. When the Vines are in blossom you may twist the shoots any way you choose without much fear of injury, meantime be content by keeping them off the glass. It is now time that all late houses were started. In order to give the Vines time to mature their wood and finish their fruit by September shut up the houses and syringe, merely giving as much fire-heat as will prevent stagnation of the atmosphere. Any late vineries which have not done so well as they might, and which have an outside and an inside border may have the roots in the inside or outside, as may be deemed most expedient, lifted. Have in readiness a sufficient quantity of turfy loam, and to every six loads add one of old plaster-mortar; if the soil be of a stiff nature, two loads of charred wood and earth, 2 cwt. half-inch crushed bones, and 4 cwt. of Thomson's Vine manure. Turn the heap over several times at an interval of a few days. Proceed to lift the roots, taking care to injure them as little as possible. Regulate and clear the drainage, replace with the compost, lay in the roots about 1 foot or 15 inches from

the surface, giving them a good dusting with Vine manure, and some of the finer portions of the compost. Place 15 to 18 inches of warm leaves on the top of the border when finished; the remaining portion can be done in the autumn, or next spring. Preparations should now be made for planting young Vines; but it is time enough for a couple of months yet to place the Vines in the border. A compost similar to the above should be got in readiness, and 6 feet inside and 6 feet outside made up, but inside leave 9 inches of soil to be put on when the Vines are planted. Prepare rafts for the young Vines by tying Hazel rods crossways; on these place turves grassy side down; place them on the floor of the late vinery. Wash out the whole of the soil from the roots of the pot Vines, disentangling them at the same time; lay these on the turves, sprinkle them with Vine manure and a nice sharp compost, to the thickness of 4 to 5 inches, should be laid on the top; give a good watering with water at 85°. When they have made a growth of 18 inches to 2 feet they can be removed to their destination, the ties cut, and the rods removed; cover over with the compost to the requisite height. Two years ago I planted two vineries, one in the ordinary way in the middle of March, the other in May, with Vines prepared as now recommended; but although six weeks later in being planted, it took the lead, and now looks a year the older. *W. M. Baillie.*

THE KITCHEN GARDEN.

MISCELLANEOUS WORK.—The recent severe weather will have delayed operations considerably in this department, and if it should continue very little can be done outside. A little delay in the work at this time of the year will not do much harm, and can be utilised in various ways indoors and out. Tomatos for outside growth, sown as previously advised, will now be ready for potting off singly into 60's, using a good proportion of leaf-mould in the soil this time; afterwards they should be placed on a hotbed for a time, where a good growing temperature is maintained. Potatos, Carrots, Turnips, &c., in frames must have plenty of air afforded them on all favourable occasions, to prevent spindling. Cauliflowers and Lettuce in frames will also require attention in giving air whenever possible, and stirring the soil amongst them occasionally. Some White Cos Lettuce should now be sown in a gentle heat and hardened off, to succeed the Brown Cos, sown in September. In fine weather the soil should be stirred in the beds of Cabbage with the Canterbury hoe, and any vacancies among the plants should be filled up; the same remarks apply to Lettuces which were planted in October. During weather unfavourable for work outside, the roots in store should be examined, stakes for Peas and Beans got ready for use, labels prepared in readiness for seed-sowing, sheds cleaned and made tidy, and late Potato sets spread out thinly, the larger ones being now cut ready for the planting later; and as soon as fine weather returns any work remaining uncompleted should be undertaken without further loss of time.

The Onion Beds.—When the ground becomes dry enough that it can be trodden on, preparations should be made for seed sowing, and no opportunity should be neglected to get in the crop, as in some seasons this means a loss of two or three weeks. If the ground cannot be raked down fine, it should be worked over with steel forks when dry until it is in good condition. To grow good bulbs it is essential that the soil should be made of moderate firmness and in light sandy soils this is very necessary, it is well therefore in such cases if the ground is dry enough to tread it well, and also to pass a light roller over it both before and after sowing; but heavy and adhesive soils will be best without either rolling or treading. The ground having been well raked over shallow drills should be drawn at 1 foot apart just deep enough to cover the seed, which should then be evenly sown, and lightly raked; in strong heavy soils it is well to have some old potting soil sited, and strewn up the drills for the purpose of covering the seed. Many gardeners make a practice of sowing Lettuce among the Onions, and I have also seen Parsley growing amongst them; this is, however, bad practice, for however good the last two crops may be among the Onions they can be grown equally good by themselves under similar conditions, and the Onions will be much better without them. *W. H. Divers, Kelton Hall.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

THURSDAY,	MAR. 8—	Edinburgh Botanic Society.
SATURDAY,	MAR. 10	Royal Botanic Society (General Meeting).
SALES.		
TUESDAY,	MAR. 6	Roses and other Plants, at the City Auction Rooms, Gracechurch Street, by Messrs. Protheroe & Morris.
WEDNESDAY,	MAR. 7	Lilies, Cocos Seeds, Plants, &c., at Protheroe & Morris' Rooms. Fruit Trees, Shrubs, Roses, Border Plants, and Bulbs, at Stevens' Rooms.
THURSDAY,	MAR. 8	Imported Orchids from Mr. F. Sander, 10, Rue Lillium auratum from Japan, 3000 American Pearl Tuberoses, &c., at Stevens' Rooms.
FRIDAY,	MAR. 9	Imported and Established Orchids, at Protheroe & Morris' Rooms. Clearance of Nursery Stock, at Crouch End, by Messrs. Protheroe & Morris.
SATURDAY,	MAR. 10	Roses and other Plants, at Protheroe & Morris' Rooms.

Everybody's Vinery.
MANY years have gone by since the late Mr. RIVERS, of Sawbridgeworth, amongst other useful lessons taught in his nursery, showed us how cheaply—that was the word that had most worth in his estimate—Grapes could be grown in this country if we would but follow his example. This example was the outcome of what he had seen in his Continental excursions, as in all probability he had come upon many similar constructions in France and Germany.

The main factors in good Grape growing in this country, as well as in the northern parts of the two countries mentioned, are heat and full exposure to sunlight; and as both are not overabundant in these islands, their effects on the Vine in the open air are not such as the Grape Vine requires to bring its fruits to perfection. Even the earliest ripening varieties, as Sweetwaters and Miller's Burgundy, find our summer all too short; recourse must therefore be had to glass structures, to intensify their ripening effects on the plant. RIVERS would have made Grape culture more popular than it is even now, and his method would have recommended itself to a class of people whose means do not allow of the erection of fine vineries, expensive boilers, pipes, and the whole of the paraphernalia

which, after all, are but a means to an end—the utilisation or supplementing of sun-heat. Sawbridgeworth has a sandy loam for its staple, and this kind of soil is that which is just suited to the Grape Vine, and therefore in making his "ground vineries" he had not to give much, if, indeed, he gave any, consideration to the border in which the Vines were to grow. It was enough for him to dig out a square hole with inward-sloping sides, to prevent earth-slips, and which was deep enough to allow of a man to walk beneath the Vines without disturbing the bunches. The ends were either closed with boards, or with tarred felt nailed on battens and whitewashed, or one was closed in that way while the earth formed the barrier at the other. A glazed roof at an angle of 35°—45°, as simple as it could be made, was placed over this hole saddle-fashion, and supported on quartering fixed to short posts at the two opposite sides of the excavation; a board or a turf wall closed whatever space existed between the eaves and the soil. Ventilation in sufficient quantity was obtained by simple contrivances—a little door in the upper angle of the ends of the structure, or by making a few panes to open outwards here and there in the roof. Bottom, or, as it is usually called, front, ventilation there was none, if we except that which was afforded by the ill-fitting turf wall or boards.

It will be seen from the above that Mr. RIVERS treated the Vine as a hardy plant that required a little assistance in our climate, and nothing more. It was not a hothouse plant hailing from a Brazilian swamp, or a West Indian Island, that needed for its well-doing that every breath of fresh air should be shut out and let into the house only at the gardener's goodwill, but a plant at home on the mountain side, less than a day's journey from London. By this rough help good Grapes were grown at Sawbridgeworth then, as they are also now, but in somewhat more expensive structures. The Vines grow in the staple soil, slightly enriched certainly, but without any expense being incurred in making drained borders or providing shutters to cover them.

There must be many parts of England where equally good facilities can be found to grow palatable presentable fruit with as little and as cheap aids as these. Many would-be growers are deterred from making the attempt by reason of their being tenants of house and grounds on yearly terms or short leases: for these the ground vinery is peculiarly suited, as no part of it can, by any argument, be made an untransferable fixture. In planting it would be found advisable to wait till May and to purchase growing Vines. These on arriving at home should be placed in the house itself for six days to inure them to the change, as when brought from the nursery the roots and foliage are tender from the great heat employed there in forcing-on the canes. When planting, take out a hole sufficiently large to accommodate the roots coiled round the ball, or that can be disentangled without the disturbance of the entire ball, and plant 6 inches away from the front wall, using a little good soil at the operation, and inserting the stem through a hole made in the turves or board, which can afterwards be closed with moss or clay. A little water may be given with a rose water-can to settle the soil about the roots. In these houses Hazel-rods, wire or string, can be employed to fasten the young Vines to, but these should not be nearer to the roof-glass than 1 foot.

The after-management would be that of a cool vinery, excepting that syringing in the morning

would not be necessary, owing to the moisture arising from the soil; and but very light syringings suffice on the afternoons of bright days, even these being dispensed with on cloudy days. Some of the Vine-houses of the Sawbridgeworth pomologist were provided with primitive but efficient means of heating; if we remember aright, there were combinations of the flue and the boiler with hot-water pipes: some were entirely flue-heated, and others with small stoves standing within the house itself.

There were various reasons given for heating a ground vinery, such as the long season and greater heat required by some varieties, or that some were more liable to mildew than others, and needed a somewhat drier atmosphere in the pre-ripening period; and in other instances artificial heat was employed to bring on early crops. There is hardly a variety of Grape worth eating that cannot be well grown in these makeshift houses where ordinary gardening intelligence is brought to bear. In them red-spider and mealy-bug are unknown, so that these sources of trouble and vexation are avoided by the cultivator.

In some parts of the Continent houses of this kind are slightly improved, that is, the bare soil inside of the hole is lined with rough boards, leaving a cavity or pit all round, as in our pigeon-hole dung-pits. This pit serves as the receptacle for horsedung and leaves, as a means of itself, or as an aid to an old-fashioned earthenware flue, to obtain the required heat for early forced Vines. Early Peaches, Nectarines, and Pine-apples, are cultivated very successfully in sunken earth pits; and further it may be remarked that the hot-bed perched on the ground-level, as often seen here, is unknown, the hotbed being always made below-ground; and by this simple means the heat is largely conserved—the leading idea in the "ground vinery." A somewhat similar Vinery is given in fig. 44, p. 275.

A RAILWAY THROUGH A PLANTATION OF PALMS.—A railway through a Palm grove is a novelty to most gardeners, we therefore avail ourselves of Mr. C. B. CLARKE'S kindness by giving an illustration taken from a photograph made by that botanist, who also kindly furnishes the following particulars:—This view (fig. 43) is from a photograph of the railway near Theria Ghat, in the Khasi Terai, in East Bengal. The Palm is *Areca Catechu*, which is largely cultivated at the foot of the Khasi Hills, where it grows as luxuriantly as in the islands at the mouth of the Megna, and attains 80 feet in height. It is the Palm which supplies the Betel-nut chewed throughout South-East Asia and Malaya; and from its exact erectness is likened by the Sanskrit writers to an arrow shot down from heaven. The railway depicted is worked, at the foot of the hill, by a locomotive; it ascends the face of the Khasi Hills 3000 feet at an angle varying from 3° to 45°, and is there worked by a wire rope. This route through Theria Ghat has always been the chief approach from the plains to Khasia; and it was this route which Sir J. D. HOOKER traversed and described in the second volume of his *Himalayan Journal*.

THE ROYAL HORTICULTURAL SOCIETY.—Judging from the letters received, a healthful interest is springing up, and all our correspondents unite in wishing that the Society may be again brought into a prosperous condition. In spite of the numerous defects in its organisation, it has done excellent work in these later times, as witness the several Congresses, and the valuable reports connected with them. The proposal of an exhibition at Chiswick in co-operation with, but not in subordination to the local societies of Richmond, Ealing, Chiswick, has been received with favour by our correspondents, and several of our City friends have expressed their

FIG. 43.—RAILWAY THROUGH A PLANTATION OF ARECA CATECHU, IN THE KHASI TERAI. (SEE P. 272.)

satisfaction at the prospect of City exhibitions. In some cases their payments as Fellows are made contingent on the carrying out of this scheme.

PROCEEDINGS OF COUNCIL. — We are requested to announce that a meeting of the Council of the Society was held on Tuesday, February 29, at which power was given to the President, Sir TREVOR LAWRENCE, Bart., M.P., to sign the agreement for the occupation of the Society's new premises, at 111,

Victoria Street, S.W., for offices, &c. [for three years], and the Drill-hall of the London Scottish Rifle Volunteers in James Street, Westminster, for exhibitions and shows [for one year]. The Society will enter into possession on the 25th inst. Both premises are conveniently situated midway between Victoria and St. James' Park Stations on the Underground Railway. The Council also drew up and adopted a scheme for the admission of Fellows paying £1 1s. subscription, and determined to admit

as Associates *bona fide* gardeners or employes at any nursery, market garden, or seed establishment, at a subscription of 10s. 6d. a year. The following committees were appointed:—*Finance*: Baron Schroder, Messrs. T. B. Haywood, E. G. Loder, H. J. Vetch, with the President, Secretary (Rev. W. Wilks), and Treasurer (Mr. D. Morris). *Chiswick Gardens*: Colonel Beddome, Dr. Hogg, Mr. G. Paul, Mr. Woodbridge, with the President, Secretary, and Treasurer. For

revising the bye-laws: Messrs. T. B. Haywood, A. H. Snee, G. F. Wilson, with the President, Secretary, and Treasurer, coupled with a request that Messrs. Deal, Pearson, and Marshall, members of the Fellows' Committee would be kind enough to confer with them. The Trustees of the Lindley Library had an interview with the Council, and it was determined to remove their Library to the Society's new rooms at 111, Victoria Street, Westminster [the Trustees agreeing to pay 1s. per annum rental]. The next meeting of the Council is fixed for Tuesday, March 6.

THE WORK OF THE SOCIETY.—In our last issue, as in the present, we read of the highly satisfactory proceedings of certain special societies, some connected with floriculture, some with various branches of horticulture, or with the commercial questions affecting the business community at large. We learn that the hospitality of the Horticultural Club—an association founded for social purposes—has been extended to various of these societies. We ask ourselves how it is that the Royal Horticultural Society hitherto has not gathered all these bodies into her own fold, and accorded them the recognition to which they are entitled? Is it a mere Utopian dream to look forward to a time when the national horticultural society shall be an Imperial Institute, according to each department its own autonomy, but as a thoroughly representative body, having the ability to speak and act with authority on all relevant public matters. Who is to blame for the miserable process of disintegration that has gone on we do not know; suffice it to say that it is time it was stopped, and it is more than time that the Royal Horticultural Society ceased to interest itself only in one or two departments, and rose to the full level of its manifold duties and responsibilities, not only to its own immediate constituency but to the nation at large.

THE NEW PREMISES.—The oftener we see them the better we like them. Of course there is plenty of room for grumblers, who do not know the circumstances, but, on the whole, we do not think the Society could have done better, and if a change be needed it can soon be effected, as the offices and Council-room at 111, Victoria Street are to be taken for three years only, and the Drill Hall, with its numerous conveniences for committee rooms, luncheon-room, storage, and exhibition purposes, for a year only. It was a matter of urgent necessity to find new offices before March 25, for to go to Chiswick would, in the general opinion, have been fatal to the prospects of the Society.

THE FINANCES.—We all know in what an unsatisfactory state these are, but it is hardly worth while to make them out worse than they are; but, on the other hand, it is worth while to remember that they have been much worse, and specially it is incumbent on us all to do our best to improve them. The *Journal of Horticulture* last week, of course by inadvertence, stated that the Fellows' committee had recommended an outlay of £700, the real sum being £220 per annum. Against this, too, it must be remembered that the Kensington expenses come to an end after March 25 next, and that the corresponding outlay in Victoria Street will be materially less. The Assistant-Secretary's salary also is, by oversight, given twice over in our contemporary's balance sheet.

THE NEW TREASURER.—One of the first duties of the new Treasurer, Mr. D. MORRIS, has been to sign a receipt for 1s., being the annual amount of the rental, to be paid in future by the Trustees of the Lindley Library for the deposit of their books in the new reading-room! This "pepper-corn" rental is rendered desirable, in order that there may be no question as to the proprietorship of the books and pictures. The *Journal* may be reassured at this prospect of an assured annual income!

LOCAL SECRETARIES AND REPRESENTATIVES.—The new Council has plenty of work before it, but we hope one of the first things it will do is to organise a thorough system of affiliation and representation in the counties, as before indicated by us.

THE PICTURES.—It has been with a feeling of sadness and indignation that we have thought of the ignominious fate of the portraits of the worthies who did so much for horticulture in the past—BANKS, DICKSON, LINOLEY, VEITCH, RIVENS, STANDISH, SKINNER. Owing to the several exhibitions, Colonial and other, the indulgent landlords required all the space at command, and the pictures had to be relegated to a place of safety, whence they will soon emerge to occupy posts of honour in the new premises. The older portraits belong to the Society, the newer ones to the Trustees. The pictures as a whole are not remarkable as works of art, but the enumeration above given will show of what interest they are to horticulturists.

THE STATUES.—Since we last wrote we have had an opportunity of inspecting them. One of them might perhaps be kept in memory of Royal favour once extended to the Society; but as to the rest, now that the Society has no ornamental garden or conservatory to maintain, they might well be sold. At any rate the matter is worth the consideration of the new Council.

ASSOCIATESHIPS.—Where is the honour if the recipients have to pay for it? The letters F.R.H.S. do not, as some suppose, indicate any particular honour, they simply show that the individual who bears them is sufficiently interested in horticulture and in the Society to be willing to pay his subscription. The real honours will be, we hope, considered to be the election as local secretary—or as an honorary associate in consequence of eminence in the practice or the theory of gardening.

THE PROGRAMME.—We have great pleasure in inserting this note from one of our leading gardeners:—"I read with pleasure your editorial notes in last week's issue, because I fancy that, through them, I can discern emerging from 'the dark cloud' traces of 'the silver lining.' The Council has only to declare itself in favour of a purely horticultural policy to gain the sympathy and monetary aid of every practical gardener in the kingdom that is in a position to subscribe. I have myself been a guinea subscriber for many years, but getting disgusted with the "shilly-shally" policy that for the past two or three years has been in vogue, I have withheld my subscription for the last two years, but I shall pay up the moment the Council decide on the new subscription rates, which in the interest of the Society ought to be decided at the first meeting of the new Council [Charter! charter!], and if they are as low as you say they are likely to be, I feel certain that many working gardeners will join the Society; at any rate, whether the Society appoint local secretaries or not (a capital idea of yours) I shall constitute myself one, and ask all gardeners with whom I come in contact, and whom I know are able, to become subscribers. The tail, 'F.R.H.S.' or 'A.R.H.S.' will draw the cash out of some."

ROYAL BOTANICAL AND HORTICULTURAL SOCIETY OF MANCHESTER.—On May 18 next the twenty-first annual national horticultural exhibition will open. It will be a "coming of age" celebration, and the Council is anxious to make it one of the most remarkable horticultural displays ever seen. Exhibitors are aware that during the past twenty years many grand floral displays have been held in the above Society's gardens, and the Council has taken this opportunity of expressing its indebtedness to all who have contributed to make the exhibitions of the past successful, and it now ventures to make an earnest appeal to all who have it in their power, not only to compete for the prizes offered in the schedule, but to send anything they may have suitable for exhibition not named therein. The attention of the judges will be drawn to any extra exhibits of this kind. The Society is now in possession of buildings for exhibition purposes not surpassed in Europe. They have what was known as the "Grand Avenue," in connection with the recent Royal Jubilee Exhibition,

also with the entire structure of the building forming the continuation thereof up to the southerly boundary of the gardens—a total length of 600 feet. The announcement of the fact will, it is hoped, inspire the confidence of exhibitors, inasmuch as tender plants will be protected.

MANCHESTER WHITSUNTIDE EXHIBITION.—The schedule for this exhibition is now issued. The leading class of the amateur's division—in which liberal prizes of £25, £20, and £15 are offered—is for the best collection of Orchids, Ferns, Palms, and other decorative plants grouped for effect. There are also classes for twelve Orchids, six ditto, and for ten *bona fide* specimens, not made up plants; also for ten Cattleyas, and for three Vandas. In the nurserymen's division prizes of the same value are offered for similar groups of Orchids and other plants. Unequaled as the display of Orchids has for many years been at Manchester it may be expected to be even still finer on the forthcoming occasion. In both the amateurs' and the nurserymen's sections there are, as heretofore, tempting prizes for the ordinary miscellaneous groups of plants, and likewise for flowering stove and greenhouse plants, Azaleas, Ericas, fine-foliage plants, Roses, Pitcher-plants, hardy herbaceous plants, and other popular subjects. Altogether there are sixty classes for plants and twelve for fruit, for which also good prizes are given. This is the twenty-first year of these great displays at Old Trafford, and the schedule has been prepared with a view to this year's display being still ahead of those that have preceded it.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—A meeting of the acting directors of this Society was held on Tuesday evening, the 21st ult., in the Secretary's office, Bridge Street, Aberdeen, Town Councillor LYON presiding. The dates for the grand floral *fête* were fixed for August 23, 24, and 25, in the Duthie Public Park, Aberdeen. The prize schedule was finally revised, and ordered to be printed and circulated among the members. Efforts are to be made to get a railway station, or platform, erected at the park previous to the *fête* being held.

THE GARDENERS' ORPHAN FUND.—The monthly meeting of the Executive Committee took place at the Caledonian Hotel on February 24, Mr. GEORGE DEAL in the chair. Mr. FELIX PYNÆERT, of Ghent, was present also, upon the introduction of Mr. J. LAING; and Mr. G. W. CUMMINS, the Grange Gardens, Wellington, one of the local secretaries, also joined the committee. The Hon. Sec. reported that there was a balance of £175 at the bank, and that another £500 would be invested in Consols previous to the election. The donations since the last meeting amounted to £46 11s. 6d., and the subscriptions to £18 16s. The wisdom of appointing local secretaries was shown from the fact that one had sent £18 and another £16. The activity shown by Mr. JOHN LYNE, Belvedere, Wimbledon, was particularly gratifying to the committee. The total sum subscribed since the establishment of the Fund is £1449 14s., and the amount actually received £1108 2s. 6d. Of this sum £1119 2s. 6d. is in the form of donations, of which £914 has been paid, and £330 11s. 6d. as subscriptions, of which £194 2s. 6d. has been received. Subscribers and donors will greatly assist the work of the committee by at once sending in the amounts promised. The form of nomination-paper was approved, and Mr. BARRON announced that an advertisement relating to the coming election had been inserted in the gardening papers, as well as in Ireland and Scotland, free of charge. A sample contribution-box was submitted by Mr. BATES; applications for boxes were also received from Messrs. ARTHUR and WILDSMITH, and a suggestion that collecting-cards should be provided came from Mr. R. GILBERT, Burghley. The provision of boxes and cards was deferred until the next meeting. Mr. HUSSEY, Haines Hill, Twyford, Berks, was requested to act as local secretary for that district. The sub-com-

mittee appointed at the last meeting to consider the advisability of holding something in the way of a popular *fête* during the present year, made a report to the effect that they had well considered the matter in every respect, and being anxious to avail themselves of the opportunity afforded by the election to the Fund on July 13 for the local secretaries and subscribers to visit London on that date, and giving them a hearty welcome, they recommended that a popular dinner be arranged at a moderate cost, so that it should be within the means of all, the dinner to take place at the close of the election. It was therefore moved by Mr. BATES, and carried unanimously: That the report of the sub-committee be received and adopted. It was further resolved, on the motion of Mr. J. WRIGHT, that the election take place on July 13, from 2 P.M. to 4 P.M., and the dinner at 5 o'clock. A sub-committee to carry out the arrangements of the election and dinner was appointed consisting of Messrs. RICHARDS, DEAN, HERBST, WYNNE, ROUFFEL, WRIGHT, with the Chairman and Hon. Secretary.

ORCHIDS AT MESSRS. LAING & SONS.—The plants at this nursery make a nice display in several of the houses that have risen from the ashes of the late fire, many recent importations having flowered that present in some cases improvements on type forms. *Dendrobium Wardianum* (Low's variety) and *D. primulinum giganteum* have robust stems, with numerous flowers. Established plants of *Cattleya Trianae* were many, as are likewise the opened and unopened flowers of the same; some large-frilled, highly-coloured flowers were observed. *C. T. alba*, still thought much of by growers, and scarce, was found in several flowering examples. The following may be mentioned as being more or less in flower at the time of our visit:—*Cypripediums* *Boxalli*, *insigne*, *heterocarpum*, *infundibulum*; *Dendrochilum glumaceum*, *Lælia alba*, *harpophylla*, several *Masdevallias*, *Odontoglossums* *Alexandra*, *crispum*, *Sanderianum*, *Rossi majus*; *Oncidium barbatum*, *crispum*, *ucullatum*, *Pilumna fragrans*.

THE SEED CROP OF 1887.—Messrs. HOGG & WOOD, in their annual report on the probable supplies of farm seeds for the current year, appear to be of opinion that there is the prospect of all sorts being abundant and low in price, with, perhaps, the one exception of Italian Rye-grass seed. Of Clovers, Rye-grasses, and permanent pasture seeds they have secured good supplies of excellent quality. Timothy, Cocksfoot, and other natural grasses are stated to be in fair supply, and, with one or two exceptions, at prices similar to those of the past season. Cocksfoot, Timothy, and Meadow Fescue are in increased demand for two and three years' pasture, along with the usual mixture. Of Tares large Scotch and foreign, an abundant crop of excellent quality is warehoused, and rates will be lower than in 1887. Of Turnips and Mangels the crop of seed was a fair one of nearly all sorts, the yellow varieties being those only of which there is a short supply, and prices will probably rule higher than last year.

EDINBURGH CHAIR OF BOTANY.—Professor I. BAYLEY BALFOUR of Oxford has been elected to the Chair of Botany in the University of Edinburgh, vacant by the death of Dr. A. DICKSON. Mr. BALFOUR is a son of Dr. J. HUTTON BALFOUR, who filled the same chair for so many years prior to Dr. DICKSON, and his appointment leaves a vacancy in the Botanical Chair at Oxford.

MELON PEAR AND TREE TOMATO.—We have received from Mr. D. MORRIS, Assistant-Director, Kew, the following communication concerning the above-named plants:—"We have neither seeds nor plants of the Melon Pear. I tried it two years ago when first introduced, and am satisfied that it has no merit whatever. I do not believe it is now grown to any extent anywhere, as it is really unworthy of cultivation. I am glad to hear of your success with the Tree Tomato (*Cyphomandra betacea*) in India and Ceylon. It is only in such climates that it

would be any good; it would never do for our northern latitudes, as it is no use the first season, and would be required to be protected by glass during our winters, which would be troublesome and expensive. PERER HENDERSON, *New York*."

ANOTHER PRETTY THING.—A very pretty floral piece, says an American exchange, made by the Cincinnati Floral Company, was decidedly original:—"Upon an easel of cat's-tails a velvet plaque rested. The latter was decorated with a cluster of Roses, and at one side, resting upon a branch of Holly, was a little owl made of Violets, and natural enough looking to fly away. Beneath was a nest full of eggs."

"COMPENDIUM FLORÆ ATLANTICÆ."—The second volume of this important publication, devoted to the enumeration and description of the plants of the Barbary States—Algiers, Tunis, and Morocco—has just been published. Its author is M. COSSON, whose name is a guarantee of thoroughness and care. As this second volume only extends to the Cruciferae, it is obvious that this generation cannot hope to see the completion of this work. The Arabic names are given as well as the Latin.

"GARDEN AND FOREST."—We are glad to learn that Professor CHARLES S. SARGENT is steadily recovering from the illness which attacked him several weeks ago. He is not yet able, however, to give active personal attention to the new American journal of horticulture, landscape art, and forestry, which he is to conduct, and it is thought advisable to defer publication until he can do so. It is, therefore, not probable that the first number of *Garden and Forest* will appear for a week or two.

FIG. 44.—A BELGIAN MARKET VINERY (SEE P. 272).

BAILLON'S "HISTOIRE DES PLANTES."—This work proceeds steadily. The last part contains the history of the Droseras, Tamarises, Willows, Podostemaceae, Platanaceae, Solanaceae, and Scrophulariaceae—an odd association. The woodcuts are excellent, and the annotations very useful, but the indices to each volume are defective.

NATIONAL CO-OPERATIVE FLOWER SHOW.—The managers of this enterprise, which is affiliated with the Royal Horticultural Society and the Agricultural and Horticultural Association, Limited, announce in a schedule of prizes just issued, that a show will be held at the Crystal Palace on August 18. It may be interesting to note that whereas last year a sum of £60 was offered in prizes, this year the sum will amount to £320, besides several promises of further subscriptions. If the entries are in anything like the proportion they were last year, the show will be one of the largest collections of *bona fide* cottagers' produce ever held.

GOVERNMENT ORDER FOR TREES IN THE ISLE OF MAN.—Last week we noted the fact of Messrs. KENNEBY obtaining a large order for the above, but have since ascertained that the order was divided between them, Messrs. LITTLE & BALLANTYNE of Carlisle, and another firm. The trees ordered are small seedlings intended to be grown in a nursery under the superintendence of a forester sent by Messrs. LITTLE & BALLANTYNE.

"BRIDES."—"Mr. EVANS is said to have the best Brides in the market." Frenchmen engaged in writing books on American manners and customs please note.

THE WEATHER AND THE FLOWERS IN SOUTH IRELAND.—Even in this favoured nook cold winds

prevail. Daffodils have made but little progress. Mr. HARTLAND's bed of *Leda* Daffodils, 150 feet long by 3 feet, white, will be a fine sight. *Prunus Pissardi* is in flower out-of-doors. *Nellebore*s have been very fine, and are growing in popular estimation both as outdoor plants and for cool-house decoration after *Chrysanthemums*.

BOOK NOTICE.

LES SERRES VERGERS: *Traité complet de la Culture Forcée et Artificielle des arbres Fruitières.* Par M. PYNÆRT. Fourth Edition. (Ghent: Librairie Générale de Ad. Hoste.)

We have here the fourth edition of a very full and exhaustive treatise on the cultivation of fruit trees under glass, by one of the most talented and able writers on horticulture, viz., M. Pynaert. The mere fact of its going through so many editions is ample proof of the estimation in which the work is held by those conversant with the French language. The edition now before us is swollen to a bulky volume of 468 pages, with numerous illustrations, a great amount of fresh matter having been introduced. Beyond the cultural and other details, which are given by M. Pynaert in his usual vigorous and well-reasoned style, and which are altogether excellent, we are furnished with numerous notices of the practices of other countries, and the various methods adopted in the forcing and cultivation of the different fruits under notice, copious extracts being made from the principal writers on similar subjects. All this is extremely interesting, showing us how we stand in comparison with our neighbours. We in England are believed to lead in the matter of Grape growing under glass, and it may be news to some to learn to what an extent Grapes are grown for market in Belgium. We copy here an illustration (fig. 44) of the style of vinery in use at Hooylaert, near Brussels, which, for simplicity, is equal to any erection we have seen.

We are told by M. Pynaert that Grapes are grown to an enormous extent around Hooylaert; that there are already over forty establishments, some of which cover several acres of ground, all devoted to the cultivation of fruit, but specially Grapes. The whole district seems to be a field of glass. A sort of wild craze seems to have possessed the good folks of Brussels to go in for this sort of thing, following the example of one or two successful cultivators, the result being that, started without any knowledge of the business, &c., the greater part is an utter failure. Amongst the successful ones M. Pynaert mentions that of M. Solie Prères, who cut during the month of April last 4000 lb. of ripe Grapes.

Full credit is given to horticultural intelligence and culture in this country, the author quoting largely both in matter and illustrations from the most of our best writers on these subjects, such as Thomson's *Handy-Book of Fruit Culture under Glass*, Barron's *Vines and Vine Culture* (unfortunately reproducing the bad illustration of a bunch of Grapes after thinning that appeared in the first edition of that excellent work). Frequent reference is made to Lindley's *Theory of Horticulture*, to Rivers' *Orchard House*, *The Fruit Manual*, &c., and our own columns. But why M. Pynaert should go back to McIntosh's *Book of the Garden* and *The Practical Gardener*, and give these as authorities, we can hardly understand. Relying on these obsolete works—the list of fruits given, Plums and Cherries specially, as grown under glass or for forcing in this country are about as bad as could be. Who in this country would recommend the Morello Cherry for culture under glass, or that of the old Catherine Peach—a clingstone variety discarded and forgotten years ago? The newer and finer varieties of these fruits that are now cultivated in this country are entirely overlooked, and seem to be unknown. It is a pity M. Pynaert should not have given this greater attention, and made it more in accordance with the present time.

DROPPERS.

SOME time since we gave a figure of some bulbs of *Scilla sibirica*, exhibited before the Scientific Committee by Dr. Lowe (see *Gardeners' Chronicle*, October 15, 1887, p. 475). At that time there was in the bulbs we examined (perhaps half a dozen) only a single bulbil visible at the extreme base of the dropper. Some of these bulbs have remained on our table in a tin box till the present time, when, observing that the bulbs had not only shrivelled somewhat, but were showing signs of a renewal of growth at the top, we cut one open, when, to our surprise, we found in the interior two or three bulbils, one above another, in addition to one at the base, the new comers coming from the sides of the tube, this tube being, as we take it, a cylindrical leaf-sheath. On examining other bulbs, six or seven in number, we found in all of them a varying number of young bulbils, as shown in fig. 45. Some of these were developing roots which were penetrating the original sheath, as may be seen close to the figure 2 in our illustration. We repeat the original illustration (fig. 46) for the sake of comparison. It is, of course, possible that these supernumerary bulbils were present though unobserved in October, but the fact remains, that all the bulbs then cut open had apparently but one bud, and that one at the base, while, now, all the bulbs cut open, show several bulbils (from 2 to 5), originating, as it would seem, not as axillary productions, but from the inner surface of the leaf-sheath. The figures 2, 3, 4, 5, show these supplementary bulbils *in situ*, as seen when the bulb is cut open; A, n, c, show the appearance of sections made obliquely across the bulb at the spots indicated. No trace of flower could be seen, so that here we have an increased production of vegetative organs, (bulbils), at the expense of flowers. This circumstance affords a clue to the cause of a phenomenon which sometimes excites surprise, viz., the apparent absence of plants in some seasons and in some situations where they might have been expected to appear. They are not really absent in such cases, but they either produce leaves only, or, as is the case with some of the terrestrial Orchids, they develop and multiply their tubers beneath the surface, till circumstances alter and the plants become once more conspicuous by their bloom.

HOME CORRESPONDENCE.

ILLUSTRATING CATALOGUES.—Is it not time that an active protest should be made against the present style of illustration as applied to advertising in horticultural catalogues, not only in the interests of truth (which has now apparently severed all connection with these productions), but also in those of the producers themselves of these barefaced insults to common sense? For is not an illustration which is palpably absurd and impossible much more likely to disgust than to attract? I am pleased to see that one of your contemporaries has taken up this subject, and hope your own influence will be brought to bear upon it, until advertisers vie with each other in their search after truth, instead of seeing who can leave her farthest in the rear in their race after sensation. *Chas. E. Pearson.*

JUNCTIONS OF PATH AT RIGHT ANGLES.—Just thirty-five years ago I was employed by the late eminent landscape gardener, Mr. W. B. Page, of Southampton, to superintend the laying-out of a new garden near that town, and I well remember, not only that in every case were paths sometimes made on the plan at right angles, but that Mr. Page frequently impressed upon me his detestation of paths sometimes at acute angles. Remembering that, I have been interested in reading Mr. Kemp's remarks, because he seems to have followed in the footsteps of my old employer. Mr. Page had very emphatic methods of denouncing objectionable ideas, and particularly did he deride any other method of entering

one path into another than at right angles. To do otherwise was to him the rankest heresy. He would reason in this way: If you make your paths at right angles, you compel any one walking on them to go clean off from one path to the other, but in the case of acute or pointed junctions, the narrow margin of turf, or whatever may be between the paths, presents a temptation to tread upon or across it, and that would be the height of absurdity in path planning. But most of all, it was Mr. Page's belief, that the gardening unities demanded the right angle junction, no matter what course a path might take after it had left the other. I confess to having the same belief, always feeling instinctively annoyed when I see very acute points marking the junction of paths. This may be a small matter, but it is one to which the new generation of gardeners may well apply their minds beneficially. *A. Dean.*

GARDENER EMIGRANTS.—In reply to "Emigrant," in your last week's issue (p. 243), it may be advantageous to many gardeners seeking a situation to hear that we have standing personal instructions from one of the largest nurserymen in the United States to send any really deserving man to him, and he will immediately give him employment. Efficient gardeners are in request, and as soon as they become conversant with the difference in climate, and can prepare for the seasons accordingly, good places are, as a rule, quickly found. *H. Cannell & Sons, Swanley, Kent.*

MUSHROOM OWING AT LYTHE HILL, HASLEMERE.—Mushrooms form an article of diet much relished here, and their cultivation is carried on extensively, and it may be said with much success. The contrivances employed to grow Mushrooms differ from those found in other private establishments. The Mushroom-house proper is in two divisions, and is fitted up with shelves standing three deep on each side the path. Another structure is a cellar made of concrete 40 feet long by 20 feet wide, beds being made on the floor on either side of the path. These beds are made deeper and more slanting on the surface than those in the house. The produce at this moment is enormous, the beds in bearing being literally covered with large and small examples of the best qualities, some of the former measured 6 inches across. Beside these places where Mushrooms are grown is a span-roofed shed, which is unheated, and from which Mushrooms are gathered from February onwards to the summer-time. The shed is in a northern aspect, sheltered from the sun, so that it is cool even in warm weather, and fine fleshy Mushrooms are grown in it when those in the Mushroom-house are uneatable. Mr. Evans, the head gardener, is an enthusiast in Mushroom growing, and experience has taught him that the beds should be at about 75°, not higher, when the spawn is inserted; this temperature he considers necessary to produce Mushrooms for a lengthy supply. *Visitor.*

AGERATUM ADA BOWMAN.—As the season when arrangements must be made for the summer bedding display is now upon us, it may be well to call attention to this *Ageratum*, which will be found one of the most satisfactory introductions of the season. It is of a charming shade of colour, 9½ inches in height, and bearing large trusses of flowers. It has a fine stiff bushy habit, which requires no pegging down, and blooms in profusion from May until cut down by the frosts. It may almost be called a perpetual blooming *Ageratum*, for when propagated in the autumn, at the time when other bedding-plants are struck, it flowers with the greatest freedom right on into January, and consequently makes a very useful plant for greenhouse decoration. *W. H.*

STRAWBERRIES.—In an article on the above subject by Mr. W. Lovel in your issue of the week before last, p. 135, I note the remark that the season of Strawberries is somewhat brief, and further, that the early varieties do not produce large berries. On these two points I am compelled to differ from Mr. Lovel. In the first place the season can be made a comparatively long one with careful management; and with regard to the size of the berries, I find that that excellent variety, Sir Joseph Paxton, will yield very large fruit at the commencement of the season, quite as large as they are at a later period. I have grown several varieties of Strawberries for early fruiting, but have discarded them all in favour of the

Sir Joseph. Gathering begins usually from June 14 to 20, and the supply is kept up from that date till the middle of September. It may interest some of your readers if I give a brief description of the method by which the supply is maintained over so long a period. As stated before, I grow the Sir J. Paxton for early work, also for the successional crops, and the Oxonian for mid-season and late supply, Keen's Seedling being grown merely for preserving purposes [too dark in colour]. I grow all the plants on borders under walls having different aspects. Those plants from which the earliest berries are gathered are growing on a border facing due south and in front of a high wall, and the fruit of these are generally ready for gathering from June 14 to 20. The successional plants are likewise planted on borders facing respectively south-west, west, and north, and these are all of the Sir J. Paxton variety; by this means the supply is extended to the end of July. Then follows Oxonian, planted on a south-west border, and these generally last from ten days to a fortnight, after which time the same variety begins to bear on north borders, and usually the supply of dessert fruit is kept up till the second week in September, unless the season be an unusually hot one, like the last, when the plants will continue to bear fruits till the first week in September. To achieve these results, the sites of the Strawberries on the borders are often changed, the plants being destroyed after the third crop is taken. If left till the fourth year the crop produced might be greater in quantity, but the berries would be very small in size, so that a point is made of breaking up a certain quantity yearly, immediately after all the fruit is gathered. The ground is then manured, trenched, and allowed to settle down, after which it is firmly trod, and is frequently replanted with Strawberries as before, with plants layered in 60-sized pots. The plants grow away, and make fine crowns by the winter, which invariably produce a good crop of fine fruit the next season. During dry weather the plants always receive liberal supplies of water, and that frequently. *A. Ward.*

TO KILL COCKROACHES.—I have found the following method very effectual:—Finely crumble stale bread; add to the crumbs dry plaster of Paris, and place this mixture about their haunts. *C. L.*

—A good recipe for killing cockroaches is Chase's beetle-paste (not the powder). If the balls of paste are placed where the insects come at night, say, once a week, it will certainly kill them, and if they reappear a few more balls will be necessary. *O. Orpet, Cirencester.*

—The "Arcanum" beetle-trap is one of the best. It is simple; you merely place under the trap a gallipot, thoroughly clean, about a quarter full of sour beer and sugar, and place it where the beetles are numerous. The outside is rough, like sand-paper, and a ring of metal is at the top, where the beetles slip down, and which must be kept bright. I have only used six traps in four years, and have quite exterminated the cockroaches, and almost so the crickets. The traps—1d. and 2s. each—are sold by Rolfe & Co., 54, Holborn Viaduct, London, E.C. *H. Birch, Castle Ashby Gardens.*

—Hester's magic paste, to be procured from the makers, Rosebery Cottage, Mayfield Road, Dalston, N.E., will rid any houses of cockroaches most effectually in a night or two. *W. E. G.*

—Until a short time ago our stove and Orchid-houses were infested with these pests. I tried the usual remedy—beer, in bell glasses—and caught numbers of them; but as they continued to plague me, I procured some arsenic, and mixing a small quantity with some brown sugar, distributed it in saucers about the houses. In less than a week there was not a live cockroach to be found. We were also greatly troubled by ants, and these also entirely disappeared. *R. W. I.*

—In reply to your correspondent, Mr. W. Watson, co. Down, I would recommend him and any one troubled with cockroaches and beetles to purchase of any ironmonger one of the "Demon Beetle Traps." I have recently used them in the house and garden, and have caught hundreds every night. They can be bought for 1s. each, and are most efficacious. I find also crickets get into them. *H. J. Buchan, Wilton House, Southampton.*

EXTRA EARLY VERMONT POTATO.—What has become of it? Many seed firms have sent me their catalogues, and I have turned them over to see if any still retain this once so much run-on favourite, and only in Mr. Cannell's, of Swanley, do I find it; yet

twenty, or even forty-two years ago all had it. This is another illustration, proving conclusively that certain varieties reach the zenith of their fame, then decline, and ultimately get lost, or, as some assert—I think not accurately—are frequently issued under a new name. This was a capital Potato for early work, rather dark and rough in the skin, but a heavy cropper, and of excellent quality. It liked a loose, warm, friable loam, such as is easily found in Kent, so I am not surprised Messrs. Cannell still have it. I have known many hundred varieties within the past thirty years, but few could exceed this in quantity or quality. It is I believe of American origin. *W. J. Murphy, Clonmel.*

THE RECONSTRUCTION OF THE ROYAL HORTICULTURAL SOCIETY.—Already I note two rocks ahead, and may espy some more, but these are the chief—dual secretaryship and emasculated fellowships. The Secretary advertises for an Assistant-Secretary at a salary of £200. Why Assistant or Vice-Secretary? and what is the use of his superior, or a Honorary-Secretary over him? Surely one head of the Society—under the Council—is enough. Under the dual secretaryship either the head becomes a dummy or a hindrance. Who ever heard of a honorary station-master or business manager? Pay a secretary, manager, or curator well, by all means; give him his head, and let him do the actual work of the Society without a curbing bit in his mouth, or being reined-in by an Honorary Secretary above him, or one or more semi-independent clerks below him. Emasculated Fellowships will prove a far greater mistake. I fail to see the honour or the benefit of admitting gardeners to a sort of mongrel Fellowship or Associateship at 10s. a head, such lower grade Fellows to have no share in the government of the Society. No, we cannot consent thus to stoop to conquer, what?—I had almost answered, nothing. I relinquished all the privileges of a Forty Guineas Life Fellowship twenty years ago—a legal document that I still hold—when it was attempted to emasculate it of all powers of modifying and improving the policy of the Society. And I can see no inducement for gardeners to purchase any sort of Fellowship stamped with the seal of inferiority, either of power or of status as to privileges, or how much is to be given for the money that may justly be apportioned as the rates of subscription. But as to the fact that all Fellows must be equal if the Society is to gather into its Fellowship the best class of practical gardeners—the Society has nothing to fear from those, as they are never likely to form a preponderating majority of its Council; and if they did it is certain that no dozen practical gardeners could have blundered more egregiously than have a succession of aristocratic and close corporation Councils, the last of which taking credit for the marvellous feat of marching out of Kensington and leaving in round numbers £80,000 sterling of the money of the Royal Horticultural Society behind it. No Council of practical gardeners would have sanctioned such wholesale blundering, whether by Royal Commissioners, Royal Heads or Government. *D. T. Fish.*

"SALTING" CULTIVATION.—In reply to "W. G.'s" inquiry, I have seen Pampas-grass grow luxuriantly where the tide overflows at times. No doubt he would find Celery grow well in the situation to which he refers, as it grows strongly on the banks of tidal rivers. *E. Sandford.*

—In answer to "W. G.'s" query (p. 249), I think the following would be likely to do well, viz.:—Celery, Asparagus, Thrift, *Althæa officinalis*, *Aster tripolium*, common Beet, *Cochlearia officinalis*, *C. armorica*, Horseradish: *Cakile maritima*, *Carex divisa*, Seakale, *Frankenia levis*, *Glaux maritima*, *Gastidium lendigerum*, *Inula crithmoides*, *Peucedanum officinale* (Hog's Fennel), *P. palustre*, *Polygonum littoralis*, *Rumex maritimus*, *Statice limonium* (Sea Lavender), *Salicornia herbacea*, *Suaeda fruticosa*, *S. maritima*, *Salsola Kali*, *Samolus valerandi*, *Tamarix gallica*, and *Zostera nana*; *Osmunda regalis* amongst Ferns. If your correspondent will consult Bentham's *British Flora*—a veritable goldmine of botanical literature—he will find therein a mass of information relative to maritime plants in general, and might possibly select many other genera and species that would be likely to suit his purpose. *J. H.*

GOOSEBERRY CATERpillARS.—In answer to the frequent question, how to destroy these, a correspondent wrote in the *Gardeners' Chronicle* four or five years ago, advising the syringing of the bushes

with a mixture of 4 oz. of alum to 1 gallon of water. This practice I have carried out every season since, and have found it a thorough cure. I use the mixture warm, for when used cold the leaves of the Gooseberry bushes become warped. Besides this, however, I also go over the bushes early in the morning, and kill the moth that breeds the cater-

FIG. 15.—ADVENTITIOUS ROOTS IN SCILLA IN MARCH.

FIG. 16.—DROPPERS IN OCTOBER.

pillar. The insect is sluggish in the morning, and may be caught easily. *J. Hamilton, Ncedwood, Burton.*

FIG TREES.—With regard to the advice given at p. 206, to "prune and nail Fig trees which are growing in mild localities at once," I may, as one having an extensive and successful experience of the culture of Figs on walls, be allowed to recommend

that pruning, and consequently nailing, of all Fig trees growing out-of-doors in cold as well as mild districts be deferred until growth begins, say the first or second week in May, according as the locality is warm or cold. There will then be no difficulty experienced in deciding which shoots shall be retained as the most likely to produce good crop, as the fruits will have commenced swelling. The fruit is not only borne on the extremities of the shoots made the previous year, but pretty well at every joint, providing that the said shoots had been pinched a couple of times during their growth, and that the wood was well ripened, as was the case last autumn. In pruning, as your correspondent very properly recommends, as much of the old wood as can be dispensed with should be cut out, retaining the shoots which are best furnished with embryo fruit to form the tree. Another reason why the pruning of Fig trees should be deferred until the terminal buds of the individual branches have pushed into leaf is that they do not then bleed so much as they would do if pruned earlier in the season. That the practice of protecting Fig trees during the winter months does more harm than good, I have no doubt. Previous to my taking charge here, some seventeen years ago, the Fig trees in these gardens, covering 300 or 400 feet run of wall, used to be disnailed and bundled together horizontally half-way down the wall, and covered with mats during the winter months; but during the interval (seventeen years) the trees have been purposely allowed to remain tacked to the wall without the slightest protection of any kind being given them, with the most satisfactory results in the way of crops. Some seasons the thermometer registered as many as 30° of frost. In conclusion, I may be allowed to say that all superfluous growths are promptly removed during the growing period, those intended to take the place of wood made the previous year at pruning time being laid in in due time. *W.*

SLUGS, &C.—Is there any known way of killing slugs, &c., contained in fresh sphagnum before using the moss for potting Orchids and other plants? I am encouraged to ask by an account in the *Gardeners' Chronicle* of some *Odontoglossums* which are grown in a bed of sphagnum, and I can hardly think such a course safe with sphagnum as ordinarily received. Perhaps the grower of those Orchids would give information through your columns. *J. Cumming.*

DRYING-OFF OF ALLAMANDAS.—I quite agree with your correspondent "Mayflower," that plants of *Allamanda* should not be dried off during the resting period. In the gardens of Lord Lilford, under the management of Mr. Harlock, the *Allamandas* are grown to perfection. The plants in question, which occupied a 7-inch or 8-inch pot, were several years ago placed on the bed of a span-roofed stove, under which was a tank with hot-water pipes running through it. The roots of the plant soon descended into the tank, and there they may be seen hanging in large clusters, enjoying the unlimited moisture summer and winter. With this treatment the plant has always grown well, and the number of flowers produced yearly is marvellous. *L. J.*

SCENT IN SOLOMON'S SEAL.—There is no doubt at all that the flowers of this plant have a most agreeable scent, as any one will easily detect by flowering a few roots. The scent is perhaps more pronounced when the plant is forced gently into flower, and it is due to confining the plant in a house that the scent is more noticeable than out-of-doors. *S.*

SOCIETIES.

EDINBURGH BOTANICAL.

FEBRUARY 9 (continued from p. 247).—Mr Patrick Geddes read a paper on the "Origin of Evergreens." He stated that the explanation he had to offer was of the same kind as his explanation of the shortening of the axis in inflorescence; as that of the conversion of hypogyny into epigyny; that given by him at the previous meeting as to the origin of spines, and that in Mr. Sewell's paper on "Floral Colour."

The Society would remember that in accounting for the shortening of the axis in the inflorescence or in the flower he had insisted on the fact that such floral modifications were only possible at the expense

of vegetation. A similar lessening of vegetation had produced spines, the explanation of that, as of the preceding variations not being accounted for by natural selection chiefly.

Finally, he reminded the Society that a similar reason for variation accounted for such different characters are to be found within a natural order—the contrast between Larkspur and Rue, Lily and Rush; thus falling under an explanation in harmony with others mentioned.

Evergreens are peculiarly natives of regions in which there is little or no difference between winter and summer—that is, they are found where they may vegetate continuously, as, for instance, is possible in Japan, their characteristic habitat.

But there is in reality no hard and fast line between evergreen and deciduous plants. It is well known to every gardener that plants generally deciduous will, in certain favourable winters, persist as evergreens. Again, plants which in one country are deciduous annually will change to evergreen perennials in another where there are more nutritious surroundings.

Evergreens are therefore plants of a vegetative habit, which may have acquired the tendency to accumulate reserve material—laying by a deposit, as it were—to tide them over the winter or that period in which they do not assimilate. It follows from this vegetative character that they will be late flowerers, and that commonly they will be less developed florally than their allies, which are not so distinctively vegetative. Double flowers are shown by experience to be later bloomers than single ones of the same species. Again, for instance, it is several years before such plants as Rhododendrons have acquired enough reserve material to enable them to flower. Evergreen plants, such as *Helleborus*, *Iris histrioides*, *Tritoma media*, which are commonly regarded as early flowerers, may with greater reason be regarded as very late flowerers, blooming, as they do, by means of reserve material stored up in the previous year.

Examination may be made of natural orders or alliances, and it will be found that the orders, or even genera that are more characteristically evergreen than their allies, have the simpler flowers. Compare in this connection Saxifragaceæ and Crassulaceæ with the deciduous Umbelliferae and Cruciferae with Fumariaceæ, Araliaceæ with Umbelliferae. But perhaps the best support is given to Mr. Geddes' position by the condition of annual plants, which in exact contrast to evergreens are the most floral of all plants in their character, and poorly vegetative. Evergreens and annuals may serve as the two opposite extremes in plant life, illustrating, the one the vegetative, the other the reproductive condition pre-eminently. But the struggle between the vegetative and the reproductive which is now recognised by biologists as the chief reaction throughout all life, is capable of being resolved into the factors of more or less vegetation among plants—one condition in which more assimilation takes place, the other in which more breaking down or destructive change is evident. The night flowering Cactus furnishes a final instance. The flower has been adapted to suit moths, which are present in greater numbers after darkness has set in. The flower is only possible in this plant after vegetation, which has been active during the day, has ceased. The flower is a product of the nutritive material stored up during the day; its strong perfume is an evidence of the intensity of the destructive change in the cell contents necessary to its production from the reserve nutritive material.

Ipecacuanha.—Mr. J. Rutherford Hill showed a sample of Indian cultivated *Ipecacuanha* root as now offered in the English market. It could be distinguished from the Brazilian root by the fibrous rootlets, which were absent from the latter as met with in commerce. He also showed a root which had been sold at Mincing Lane as Indian *Ipecacuanha* root, but which was not an *Ipecacuanha* root at all. The spurious drug consisted of more or less conical or fusiform tap-roots, pale yellowish-brown externally, white and starchy internally, without the characteristic cortical layer and woody medullium of *Ipecacuanha*. It contained no alkaloidal principle. Its botanical source had not yet been determined, but it bore some resemblance to the root of *Aconitum heterophyllum*.

Astragalus.—Mr. Rutherford Hill also showed a plant recently received from a correspondent in Cyprus. The specimen consisted of the herb with immature legumes and a few flowers in a chopped up condition. It appeared to be a species of *Astragalus*, and Mr. Lindsay, of the Royal Botanic Garden, to whom it had been submitted for identification, without any

information as to its source, had suspected that it was the *Astragalus mollissimus*, or Loec Weed of North America. On making further inquiry as to the properties and uses of the plant the following reply had been received from Cyprus.

"The name of this plant among the natives is 'Zacroune,' and it has a deleterious effect on animals. If cattle, goats, or sheep eat it, especially while the plant is in blossom, they get sick and fall down as if intoxicated; at the same time, when the Barley harvest is poor in Cyprus, and there is a scarcity of chopped straw, on which cattle are fed, the natives collect this plant, cutting it from the roots and have it thrashed, and mix it up with chopped straw for feeding their cattle; but until they are used to this food they are always sick and ill."

From this account it seemed very probable that the plant was really the *Astragalus mollissimus*, or some closely allied species. Specimens of the entire plant and seeds had been sent to the Botanic Gardens, but the parcel had, unfortunately, gone astray, and it was hoped that a further supply would be got next season.

LINNEAN.

FEBRUARY 16.—W. Carruthers, F.R.S., President, in the chair. Announcement was made of an acceptable donation of books to the library by the widow of the late Dr. John Miller, Fellow of the Society, recently deceased, and a unanimous vote of thanks accorded.

Mr. Spencer Moore exhibited, and made some remarks upon, specimens illustrative of the Palmella state of *Draparnaldia glomerata*.

Mr. D. Morris, Royal Gardens, Kew, exhibited a specimen of wood of *Hieronyma alchorneoides*, received from Trinidad, showing in its fissures mineral deposits which, on chemical analysis, proved to be calcic carbonate. For comparison Mr. Morris also exhibited and made some observations upon some deposits of calcic phosphate in Teak. Some of these (described by Sir Fred. Abel, *Quart. Jour. Chem. Soc.*, xv. 91) are 6 feet in length, 6 inches in breadth, and from $\frac{1}{2}$ to $\frac{3}{4}$ inch in thickness. Deposits in Bamboo known as *tabasher* (silicate) were shown, as also pearls (carbonate of lime) from Cocoa-nuts, received from Dr. Sydney T. Hickson (*see Nature*, vol. xxxvi., p. 157). All these specimens were from the Museum of Economic Botany of Kew.

Dr. Burn Murdock exhibited, and offered remarks upon the intra-marginal (so-called) veins in the section *Areolata* of the genus *Erythroxylon*, of which *E. coca* is the most familiar species. These lines are due to a thickening of the parenchymatous tissue, which takes place in the bud stage, and are in no way connected with the venation of the leaf.

Mr. G. F. Sherwood exhibited a collection of photographs taken in Samoa illustrating the scenery and people, together with a number of necklets formed with strings of various bright-coloured seeds.

The first paper of the evening was by Mr. H. N. Ridley, on self-fertilisation and cleistogamy in Orchids. Three common methods of self-fertilisation were explained:—1, by the breaking-up of the pollen mass and falling of the dust either directly upon the stigma, or into the lip, whence it comes into contact with the stigma; 2, by the pulling of the pollen masses as a whole from the clinandrium into the stigma; 3, by the pulling forward of the pollinia from the clinandrium or the anther cap, the caudicle and gland remaining attached to the column. An interesting discussion followed in which Professor Marshall Ward, the Rev. G. Henslow, and Mr. A. W. Bennett took part. A paper was then read by Dr. John Rae, F.R.S., entitled "Notes on some of the Birds and Mammals of Hudson Bay Territory."

Dr. Rae, whose long residence in Northern and Arctic America enabled him to speak authoritatively from personal observation, gave an interesting account of the migration of the Canada goose, snow goose, and blue-winged goose, and of the habits of the American hare and lemming. He particularly referred to the belief entertained by some of the Indian tribes he had met with, and to which he himself gave credence, that certain species of small birds are assisted on their migration by being carried on the backs of the Canada geese.

Mr. J. E. Harting, in criticising this paper, gave an exposition of the view held by leading ornithologists on the subject on the American, Canada, and snow geese, their relationship and nomenclature, and pointed out that the story of small birds being carried by larger ones is not confined to North America, but is current in South-Eastern Europe, Palestine, and Arabia, where reliable evidence has

been obtained that wagtails and other small birds travel on the backs of Cranes. He added that one instance was known to him of such an occurrence in England, a short-eared owl having been seen to arrive on the north coast of Yorkshire carrying on its back a golden-crested wren, which was secured by the observer.

TREES AND SHRUBS.

HAMAMELIS ZUCCARINIANA.

I SEND herewith a finely bloomed specimen branch of the very scarce shrub, *Hamamelis Zuccariniana*, of which my specimen is the only one I know or have ever met with, and the nurseryman who sent it me can no longer supply or procure plants of it. I think it most effective, and quite distinct from any other member of the family I have ever seen. Please also note the very peculiar odour exhaled by the flowers, which does not, I think, exist in the flowers of *H. arborea* or *H. virginica*. This odour somewhat resembles that of a laundry. *W. E. G.*

[Botanists, for the most part, consider that there are but two species of this genus, one the North-east American *H. virginica*, the other the Japanese *H. japonica*; Franchet even goes so far as to combine the American and the Japanese species. For garden purposes, however, the forms are quite distinct enough to warrant separate appellations. *H. virginica* is the best known but the least attractive, its flowers being smaller than in the other forms. *H. arborea* is now generally referred to *japonica*. Its flowers, crowded, as it were, into sub-globose heads at the ends of the short branches, and the deep claret colour of the inner surface of the sepals, are remarkable.

In *H. Zuccariniana*, which we received from Messrs. Ottolander, of Boskoop, in 1874, the inflorescence is more racemose, the flowers being arranged in longish clusters on either side of the branches of the inflorescence, and the interior of the calyx is much less highly coloured. The manner in which the bright yellow petals are rolled up in the bud is very curious. As winter-flowering hardy shrubs there are few to equal, and none to surpass in beauty and interest these curious shrubs. *Ed.*]

BERBERIS CHINENSIS.

In "A. D. W.'s" notes on berry-bearing Barberries (p. 149) he does not mention the most beautiful of all the berried Barberries in my estimation. This is the little *B. chinensis*, or, as it is more commonly called, *B. Thunbergii*. It is a dwarf grower, and, being very dense and bushy, is neat. From early autumn till early winter the bushes of it are generally covered with a profusion of small oval berries the colour of red sealing-wax. They are produced singly, but are very numerous. Another beautiful berried Barberry he does not mention is *B. asiatica*, whose berries are the size of Peas, and covered with a glaucous bloom, like a black Grape, and hang on the bush like pearls. Not half enough praise is bestowed on the common *B. aquifolium*, which in autumn, with crowds of clustered berries like miniature Plums, has a charming effect. *G.*

WINTER FLOWERING SHRUBS.

Mr. Horsefield's list of winter-flowering shrubs out-of-doors (p. 150) does not include two of the most beautiful. One is the Mezereum, which I feel sure Mr. Horsefield must have overlooked, being such a common shrub; the other is a rarity—the Japanese Witch Hazel (*Hamamelis arborea*). This last is a most charming shrub, and of exceptional interest. It flowers while leafless, the naked twigs and branches being now wreathed with most curious flowers, and having curly petals of a bright yellow, and a centre the colour of ruby. The flowers put me in mind of a miniature octopus, and are different from any other flower I know. It is an infinitely superior shrub to the commoner *H. virginica* which one meets with in old gardens, and from its habit of flowering in the dead of winter it is a shrub for

every garden. It should be planted in a spot near the house, where its flowers may be conveniently seen, or it would do against a wall. The Garrya makes a good wall plant, but it also is one of the best evergreens as a standard bush, and so grown it flowers quite as freely as against a wall. The different forms of *Daphne mezereum* should receive the attention of those who like winter-flowering shrubs. Besides the single white there is the double, and one or two very deep coloured forms. The Witch Hazel, I omitted to add, can be seen at Kew, and I believe also in the Coombe Wood Nursery, in flower. H. G.

VARIORUM.

ANTS AND PLANTS.—In the last volume of the *Nova Acta Regiæ Societatis Scientiarum Upsaliensis*, Professor Lundström publishes some remarkable information on the relation between ants and plants. Studying the nectar produced on the leaves of the Cow-Wheat (*Melampyrum*) he found that ants were attracted by the nectar on the leaves, and that some while walking over the leaf bore the seeds of the Cow-Wheat in their mouths down towards the ground. Professor Lundström was astonished by the great resemblance of these seeds to the "ant-eggs" (the cocoons of the ants), and he found that the ants took these seeds for cocoons; for when he strewed some seeds on the ground the ants saved them as they did their cocoons. Lundström afterwards found that the thin membrane which surrounds the seed and causes it to resemble an ant egg so closely, falls off soon after the seed is brought by the ants to the soil, and that it remains there untouched by the ants. Another observation of the same author, noteworthy for arboriculturists, is the following. At Christineberg, near Hudiksvall, the soil in an avenue of *Populus tremula* was dug and the ants, which were formerly very numerous, disappeared in consequence. In the next year Professor Lundström found that the leaves of these *Poplars* were destroyed by insects in a short time, whilst those of the other *Poplars*, where the soil had not been dug up, were quite intact. Careful observation showed that the first leaves of the trembling *Poplar* have short round petioles with nectar glands, whilst the petioles of the older leaves are much longer, flat, and without these glands, as, Trelease showed in the *Botanical Gazette*, vi. (1881). Lundström's notion is, that the ants are attracted by these glands, and preserve the tree from the attacks of caterpillars, &c., for the first time. At a later season the leaves with the long, flat petioles are so much disturbed by the movements of the leaves that no caterpillar can go on them. The author found ants in every situation where the trembling *Poplar* grew.

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending, February 27, is furnished from the Meteorological Office:—

"The weather has been in a dull and gloomy condition in all parts of the Kingdom. Slight showers of snow have been experienced at nearly all stations, but few heavy falls have occurred.

"The temperature has continued below the mean in all districts. In Scotland the deficit varied from 4° to 6°, and in Ireland from 6° to 8°, but over the greater part of England it was as much as 10°, 11°, or 12°. Over England and Ireland the temperature was even lower than that of last week. The difference of the weekly average from the mean for the season over England has not been so large since the week ending January 24, 1881. The highest of the maxima, which were generally recorded either on the 21st or 27th, ranged from 37° in 'England, E.' to 48° in 'Ireland, N.' The lowest of the minima, which were registered on rather irregular dates, varied from 17°

in the 'Midland Counties' and 'Ireland, S.' to 26° in 'Scotland, W.' and 27° in 'England, N.E.' The very low average over England and Ireland is not so much due to low minima as to the extremely low maxima which have prevailed.

"The rain fall has been considerably less than the mean in nearly all districts.

"Bright sunshine has been very deficient generally, the percentage of the possible amount of duration ranging from 2 in 'England, N.E.' 6 in the 'Midland Counties,' 7 in 'Scotland, E.' and 8 in the 'Channel Islands,' to 24 in 'England, S.W.' and 26 in 'Scotland, N.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Obituary.

If proof were needed of the necessity for the establishment of the "Gardeners' Orphan Fund," no better instance could be found than that which we regret to have to record by the death, on the 19th ult., of Mr. JAMES HYDE, at the early age of forty-seven. He has been for the last eight years gardener to R. Christy, Esq., Watergate House, Emsworth, Hants, and leaves a widow and nine children, the eldest fifteen years, and the youngest ten months, totally unprovided for. Previous to going to Watergate, Mr. Hyde was gardener for nine years to Captain Elliot, Farnborough Park, Hants. He was a quiet, unassuming, hard-working gardener. He died from paralysis, accelerated by anxiety to get out to work before he had thoroughly recovered from a previous attack of congestion of the liver. W. Wildsmith, Heckfield.

ENQUIRIES.

"He that questioneth much shall learn much."—BACON.

BASIC CINDER.—Can any of your readers state their experience of the use of basic cinder as a manure? I recently heard it stated that it contained 38 per cent. of phosphate of lime, but that the demand for it in this country was so small that it was exported wholesale to Germany from the Cleveland district. Any information as to the solubility of the phosphate, or the composition of the remaining sixty-two parts, will be thankfully received. A. G. B.

FOR GARDENERS ONLY?—In the schedule of prizes offered at our show this year there are classes open to gardeners and to nurserymen, also to gardeners only. Can a jobbing gardener who is employed by a nurseryman exhibit in the classes for gardeners only? Can a manager of a nursery who hires a piece of ground on his own account exhibit in the classes for gardeners only? *Sittingbourne*. [We are of opinion that the same principle applies to both these cases. Provided that the jobbing-gardener and the nursery manager grow, as private individuals, on their own ground, and not for profit or for sale, they are both entitled to show in the classes for gardeners only. In each case the exhibits are the result of private, not of commercial enterprise. But as this is a matter upon which opinions may differ, we suggest that the committee be asked to define what they mean. Ed.]

NOTICES TO CORRESPONDENTS.

BOOK—GARDEN CHEMISTRY: H. B. P. *How Plants Grow* (Macmillan); *Plant Life* (Bradbury, Agnew, & Co.).

COLOGYNES: H. S. T. You can pot them all up at once, and place them in a cool intermediate-house. Give a medium quantity of water at present, and supply more freely when they commence to grow.

CORRECTION.—In "The Action of Frost on Seedlings," p. 240, in our last issue, the eighth line from bottom of the middle column should read, "in the same time must remain a question."—*Amaraboya* and *Piper rubro-venosum*. These should have been mentioned as having been illustrated in the *Illustration Horticole*, not in the *Lindenia*, which is devoted especially to Orchids.

DRY-GLAZING: J. C. H. It is contrary to our rule to recommend tradesmen. There are several systems of dry-glazing in use, and which are frequently advertised in our columns, and strongly recommended by competent authorities.

DRY GLAZING: E. There are so many systems or modifications of dry-glazing in existence now all very similar, and all no doubt excellent, so that it is next to impossible excepting by actual experience to say which is the better or the most to be preferred. We cannot discover any material distinction between yours and several others which we have seen.

GARDENIA ROOTS: S. P. Your *Gardenia* roots are infected with the root-worm, fully described and figured at p. 488, April 9, 1887. Burn the plants, and start in fresh soil.

INSECTS: *W. H.* The white curved grubs which have destroyed your Maidenhair Ferns by gnawing the plants off just under the crowns, are the larvae of one of the most destructive kind of the weevils (*Otiorhynchus sulcatus*). It is almost omnivorous, both in the larva and perfect states. The larvae are now nearly full-grown; but you had best take up the plants, and shake off all the earth, and report them in fresh mould. *I. O. W.*—*R. E.* The Cattleya-fly was originally imported, but it breeds freely here.

NAMES OF FRUIT: *D. Bros.* Not known. Seems to be distinct, but not of any special merit.—*Elizabeth C.* We do not recognise the Apple. Seems to be a very good sort.—*F. B.* 1, Rymer; 2, Mother.

NAMES OF PLANTS: *D. S.* *Rhododendron Maddeni*, of which *Jenkinsi* is a synonym.—*W. H. K.* *Justicia flavicoeca*.—*G. T.* 1, *Helleborus viridis*; 2, *Chorozema ilicifolium*; 3, *Cornicola glauca*; 4, *Sericocombia pentrosiensiensis* ×; 5, *Alonsoa Warscewiczii*; 6, *Begonia manicata*.—*F. Hester.* *Oncidium Baueri*.—*G. O. P.* 1, *Pteris serrulata cristata*; 2, *Adiantum Capillus-venenis*; 3, *Davallia canariensis*; 4, *Dracena fenera*; 5, *D. terminalis*; 9, *D. Guilfoylei*; 6, *Acalypha Macafeeana*; 7, *Begonia parvifolia*; 8, *Begonia*, unknown; 10, *Agatheae celestis*; 11, *Cestrum (Habrothamnus) corymbosum*. Next time send only six specimens.—*D. S.* *Rhododendron Maddeni.* Name lost—specimen sent in bud: *Rhododendron Falconeri*.

ODONTOGLOSSUM ALEXANDRE: *W. D.* The flower is a fine one, but does not differ from many others.

PRIMULAS: *P. & Son.* The flowers are flesh-colour, not white as you state; it is a pretty form, but we can say nothing about it from flowers alone.

SEAFORTHIA ELEGANS: *R. A.* This Palm cannot be cut back. The stem has no other bud except the terminal one, so that if you remove the head the stem must die. Nor can you cut off the stem and plant it as a cutting. Unless you can lower your specimen by sinking it into the floor, you must either remove it to larger quarters or sacrifice it, and plant a young one in its place.

SPIRÆAS AND MANURE-WATER: *Young Grower.* Plants of the slender, twiggy habit of most of the species of the above should be but sparingly supplied with manure-water, but sufficient nutriment should be incorporated in the soil used in potting them. Plants lifted from the ground, such as the common *Spiræa japonica*, cannot make use of manures to any extent before they bloom, and it is of but little use afterwards. Shrubby *Spiræas* may be grown in fairly rich ground, so as to induce the formation of long shoots, and these must be well matured by abundance of direct sunlight if much bloom is to be looked for.

THE EARLIEST TOMATOS: *A. M.* The Chiswick trials of these (see p. 411 in our issue for October 1 last), will afford you the information required.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

MARKETS.

COVENT GARDEN, March 1.

We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

PRICES remain as last week. With supplies coming shorter, our market is kept clear. James Webber, Wholesale Apple Market.

Table with 2 columns: PLANTS IN POTS.—AVERAGE WHOLESALE PRICES. Lists items like Azalea, Bouvardia, Cyclamen, etc. with prices in s. d. s. d.

Table with 2 columns: CUT FLOWERS.—AVERAGE WHOLESALE PRICES. Lists items like Acacia, Anemone, Arum Lilies, etc. with prices in s. d. s. d.

* * * Orchid bloom in great variety, but the demand not very good.

Table with 2 columns: VEGETABLES.—AVERAGE RETAIL PRICES. Lists items like Artichokes, Beans, Beet, etc. with prices in s. d. s. d.

POTATOS.—Regents, 60s. to 80s.; Magnums, 55s. to 70s.; Hebrons, 100s.; Dunbar Magnums and Regents, 95s. to 100s. per ton; and heavy market.

Table with 2 columns: FRUIT.—AVERAGE WHOLESALE PRICES. Lists items like Apples, Grapes, Keat Cobs, Lemons, etc. with prices in s. d. s. d.

SEEDS.

LONDON: February 29.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report that there was very little business transacted on the seed market to-day. The long-continued wintry weather naturally delays the sowing demand. Meantime, values all round appear to have touched bottom; stocks are moderate, and heavy consumptive wants have still to be satisfied. Clover seeds, therefore, offer no subject for remark. The supply of Sanfoin is small. There is no alteration in spring Tares. Hempseed continues extremely scarce. Rape seed firm.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended February 25:—Wheat, 30s. 2d.; Barley, 29s. 8d.; Oats, 16s. For the corresponding week in 1887:—Wheat, 32s. 7d.; Barley, 25s.; Oats, 16s. 11d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: February 29.—A dull demand for most descriptions, the best alone commanding an active trade. Green stuffs continue to be in request at advanced prices for short arrivals. Quotations:—English Apples, 5s. to 7s. per bushel; American Apples, 14s. to 21s. per barrel; Cauliflowers, 7s. to 14s. per tally; Savoys, 5s. to 10s. 6d. do.; Brussels Sprouts, 6s. to 7s. per sieve; Spinach, 2s. to 3s. do.; Turnip-tops, 2s. 6d. to 3s. 6d. per sack; Greens, 4s. 6d. to 5s. per dozen bunches; Turnips, 3s. to 3s. 6d. do.; Carrots, 2s. 6d. to 3s. do.; Rhubarb, 3s. to 5s. per dozen bundles; Celery, 10d. to 1s. 6d. per bundle; Horseradish, 1s. to 1s. 4d. do.; Beet-roots, 6d. to 8d. per dozen; English Onions, 12s. 6d. to 14s. per cwt.; foreign do., 10s. to 12s. per bag of 110 lb.; Carrots, 32s. to 40s. per ton; do. for horses, 28s. to 30s. do.; Mangels, 20s. to 22s. do.

STRATFORD: February 28.—Quotations:—Savoys, 10s. to 12s. per tally; Greens, 3s. to 3s. 6d. per cwt.; Brussels Tops, 2s. to 3s. per basket; Celery, 6s. to 9s. per dozen bundles; Rhubarb, 2s. to 2s. 6d. do.; Beetroots, 4d. to 6d. per dozen; herbs, 4s. per dozen bunches; salads, 2s. to 2s. 6d. do.; Carrots, 2s. 6d. to 3s. do.; Turnips, 3s. to 3s. 6d. do.; do. 35s. to 55s. per ton; Carrots (household), 40s. to 50s. per ton; do., cattle feeding, 28s. to 31s. do.; Parsnips, 6d. to 1s. per score; Mangels, 19s. to 22s. per ton; Swedes, 20s. to 22s. do.; Onions, English, 13s. to 15s. per cwt.; Dutch, 10s. to 12s. 6d. per bag; German, 12s. to 14s. per case; Apples, English, 2s. 6d. to 6s. per bushel; do., foreign, 20s. to 30s. per drum; Watercress, 6d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: February 28.—Supplies are checked by severe weather, and for best samples prices are firm, but the general trade continues slow. Quotations:—Regents, 110s. to 125s.; Magnum Bonums, 46s. to 105s.; English Rocks, 55s. to 110s. per ton; Dutch, 2s. 6d. to 2s. 9d. per bag.

COLUMBIA (East London): February 29.—Quotations:—Regents, 60s. to 90s.; Champions, 45s. to 60s.; Victorias, 55s. to 75s.; Magnum Bonums, 45s. to 70s.; Beauty of Hebron, 120s. to 140s. per ton.

STRATFORD: February 28.—Quotations:—Scotch Regents, 70s. to 90s.; Magnums, 70s. to 85s.; English, 55s. to 75s.; feuland, 45s. to 50s. per ton.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 85s. to 97s. 6d.; inferior, 78s. to 82s.; hay, prime, 70s. to 92s.; inferior, 45s. to 65s.; and straw, 28s. to 42s. per load.

SANKEY AND SON'S GARDEN POTS.

From Mr. THOS. B. THOMSON, Nurseryman, 20, High Street, Birmingham.

"GENTLEMEN.—The pots have come to hand, and, as usual, have given us the greatest satisfaction. We wish to take this opportunity of informing you that for the large number of years we have dealt with you we have always been highly satisfied with the pots you have sent us. For strength, colour, porosity, lightness, and finish we consider them the best in the market."

"BULWELL POTTERIES," NOTTINGHAM.

Carriage and Breakage Free on £10 Orders. Half Carriage and Breakage Free on £5 Orders.
Samples (carriage free) gratis, prices free on application.

From Mr. H. GRIBBLE, Gardener to His Excellency the Marquis of Londonderry, Wynyard Park.

"GENTLEMEN.—I am very pleased with the quality of your garden pots. For lightness, durability, and keeping their colour they are the best pots I have ever used. Your pots that I have used for cool Orchids for over a year are perfectly clean and porous now, this saying a great deal where moisture is abundant and other pots require scrubbing frequently to keep them clean and porous. They are equally clean for stove plants."

BEGONIA TUBERS.—BOX'S Jubilee Varieties. Twelve distinct colours, viz:—Red, crimson, scarlet, pink, rose, purple, white, canary, yellow, apricot, bronze, orange, salmon, per dozen, 6s.; post-free. The best and cheapest procurable.—JOHN R. BOX (for ten years J. LAING'S sole partner), Seedsman and Begonia Grower, Croydon.

NEW WHITE ROUND POTATO, WEBBER'S "EARLY WHITE BEAUTY". Awarded First-class Certificate, Royal Horticultural Society, September 21, 1887. (See *Gardeners' Chronicle*, January 28.)
The many Testimonials received from well-known authorities speak so well for the excellence of this splendid new white-skinned Potato, that a lengthy description is unnecessary. In short, it possesses every good quality. It is of handsome appearance, with shallow eyes, and the superior Beauty of Hebron, both for quality and productiveness, whilst its dwarf habit and extraordinary quickness of maturation make it invaluable for early work. It has been tried on all kinds of soil with most satisfactory results, producing in every case a fine crop entirely free from disease. Send post-card for illustration and read Testimonials. Price per lb., 1s.; 7 lb., 6s. Sample pound, post-free for sixteen penny stamps.
Address, F. WEBBER, Quarry Hill Nursery, Tonbridge.

CARNATION "GLOIRE DE NANCY"
Without doubt the grandest Carnation ever sent out for Cut as well as Conservatory and the Open Border. Flowers from 2 to 3 inches across, pure white, and strong Clove-scented. More robust than the old red Clove, and freer. Good rooted Layers, 25s. per 100, 15s. for 50, 8s. for 25. Cash with order.—E. COLLINS AND SONS, Cumberland Park Nursery, Willesden Junction, London, W.

CHRYSANTHEMUMS.—New, Descriptive, and Priced CATALOGUE of 1000 New and Old Varieties worth cultivation, giving Raiser's Name, Year of Introduction, List of Early, Medium, Late, Exhibition, Specimen, Market and Scented Varieties, with heights and other information, and Cultural Directions, by E. Molyneux and C. Orchard. Post-free, 6d.
ROBT. OWEN, F.N.C.S., Floral Nurseries, Maidenhead.

TREES and SHRUBS suitable for Towns and Smoky Districts. CATALOGUE Free on application.
RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

A Good Potato, of Sterling Worth. MAIN CROP KIDNEY.
W. W. JOHNSON AND SON.
First-class Certificate awarded by the Committee of the Royal Horticultural Society, September 21, 1887.
It was tested by cooking, and described by the Committee as a "White Kidney, with clean, rough skin, white flesh, a good cropper."
This Potato is pronounced by competent judges as likely to become one of the best Main Crop Potatoes of the future. It has entirely resisted disease; tubers have a handsome appearance, with very shallow eyes; are white, mealy, and of the finest flavour when cooked. In excellent condition for the table from the time of taking up until late in the spring.
Price per peck of 14 lb., 3s.; per bushel, 18s.
Wholesale of Messrs. HURST AND SON, 162, Houndsditch, London, E.; and from W. W. JOHNSON AND SON, Seed Potato Growers and Seed Merchants, Boston, Lincolnshire.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,
 Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glasshouse, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. Price 2s. post-free.
 A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentleman waited on in any part of the country. Plans and Estimates free on application.

WHY SUFFER FROM NEURALGIA
 when you can get from any Chemist
 A BOX OF
MACK'S NEURALGIA
 for 1/1½; post-free, 1/3. **CURE**

IF YOUR Chemist has NOT got it, ask him to order it for you.

"NEURALGIA is indicative of a low condition of health which must render those affected susceptible to diseases. Neuralgia indicates a low state of vitality, and nothing so exhausts the system as pain that prevents sleep, and agitates body and mind. It is not wise to suffer the distress caused by this malady without seeking relief."

A LADY writes:—"The use of one powder of MACK'S NEURALGIA CURE gave me prompt and permanent relief."

A GENTLEMAN writes:—"I have suffered from Neuralgia for two years. A friend sent me a box of MACK'S NEURALGIA CURE. The third powder gave me relief. I am telling every sufferer from Neuralgia I meet about it."

THE TRADE supplied by Newbery, Barclay, Sauger, Edwards, &c., London; John Thompson, Liverpool; Thos. McMullan & Co., Belfast; and other Wholesale Druggists and Patent Medicine Dealers, from whom any Chemist can have it by return of post.

GROWER, or under a Foreman.—Age 24; ten years' experience in Fruit, Ferns, and General Market Stuff.—G., 24, Turner Road, Lee, S.E.

JOURNEYMAN (FIRST), in the Houses; age 22.—Mr. BRADY, Gardener, Watcombe Park, Terquay, can highly recommend a respectable young man. Four years' good character.

JOURNEYMAN (FIRST), in the Houses, in a good Gentleman's Establishment.—Age 23; several years' good experience, chiefly under glass. Good reference from Head Gardener from last place.—M. R., 47, Upper Park Road, Hampstead, N.W.

JOURNEYMAN, in the Houses.—Three years in present situation. Bothy preferred.—W. LOCKYER, Ditton, Maidstone, Kent.

JOURNEYMAN, in the Houses.—Age 19; four years' experience. Bothy preferred.—E. WIL-LATT'S, Gardens, Buckhurst, Wokingham, Berks.

JOURNEYMAN, in the Houses.—Age 21; eight years' experience. Good references. Bothy preferred.—D. ANSTAY, Dyrham, near Marshfield, Chippinham.

JOURNEYMAN, in the Houses.—Age 22; seven years' experience. Good reference.—W. JONES, The Street Gardens, Cherley, Lancashire.

JOURNEYMAN, in the Houses in a good Garden.—Good references.—J. BAKER, Huntton Hill, Maidstone, Kent.

JOURNEYMAN, in the Houses in a good establishment.—Age 21; first-class reference as to character and ability from last situation.—W. QUARRY, Glenthorne, Stanmore, Middlesex.

JOURNEYMAN, in a Gentleman's Garden, where Fruits, Plants, &c., are well grown.—Age 21; four years in Plant Nursery.—S. STUTTARD, Edgend, Brierfield, Burnley, Lancashire.

JOURNEYMAN, in the Houses.—Age 21; bothy preferred. Five years' experience Inside and Out. Good character.—A. TROTT, The Gardens, Woodhurst, Crawley, Sussex.

JOURNEYMAN, in the Houses.—Age 20; six years' experience, last two years in Orchids. Well recommended.—M. DYER, Gatton Lodge, North Cray, Kent, would be pleased to hear of situation as above. Bothy preferred.

JOURNEYMAN, in the Houses, in a good establishment; age 26.—Mr. JACKSON, Gardener to the Right Hon. Lord Scarsdale, Kedleston Hall, Derby, will be pleased to recommend Arthur Spry, as above.

JOURNEYMAN, in a good establishment.—Age 20; four and a half years with present employer; good character.—Mr. HENDERSON, Mableton Park Gardens, Tonbridge, Kent.

To Nurserymen.

JOURNEYMAN, Inside.—Age 23; good knowledge of the trade. Good character from present and previous employers.—M. D., Waterloo Place, Tenbridge, Kent.

JOURNEYMAN (SECOND or THIRD), in a good place; age 19.—Mr. W. YOUNG, Barton Court Gardens, Kintbury, Berks, can recommend a young man as above.

JOURNEYMAN, Inside or Out.—Age 20; five years' experience. Good references.—H. EYES, 4, Golder's Hill Terrace, North End, Hampstead, N.W.

IMPROVER, in the Houses.—Age 20; four years' experience, three years in Houses.—J. HAYES, Lockerley Hall, near Remsey, Hants.

IMPROVER, in a Gentleman's Garden or otherwise.—Age 17, respectable; three years' good character.—F. PRICE, Chapel Hill, near Margate.

IMPROVER, in the Houses, Gentleman's Garden, or Market Nursery.—Age 22; can be well recommended.—C. F., 18, Wainwright Row, Hunslet Carr, Leeds.

IMPROVER, in a Gentleman's establishment.—Age 18; two years' good character from present situation.—Please apply, J. KEMBLE, Ewell Castle, Ewell, Surrey.

IMPROVER, in a Gentleman's Garden.—Age 18; three years' good character.—J. E. SMITH, Gardener, Westwood, Guildford, Surrey.

IMPROVER, in a good establishment, Inside and Out.—Age 20; strong and willing. Four years' experience. A Premium given.—G. L., 43, Newland Road, Worthing, Sussex.

IMPROVER, in Private Garden.—Age 19; four years' experience. Can be well recommended as steady, obliging, and energetic.—C. TATHAM, Folly House, Darley Abbey, near Derby.

TO GENTLEMEN.—A young man (age 22) seeks re-engagement with a Gentleman. Has had seven years' good experience in Plant and Grape Growing. Three years with late employer, Mr. John Ward, Leytonstone.—DRAPER, Essex Villa, Brunswick Street, Walthamstow.

TO NURSERYMEN, &c.—A German (age 26) seeks re-engagement. Good Propagator, and well-up in Plant-growing of any description. Large establishment preferred.—For references and further particulars, apply to PROPAGATOR, *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO NURSERYMEN.—Wanted, by a young Mau (age 24), a situation in a Nursery. Has had eleven years' experience in the Houses. Good Propagator and Grower of Plants for Market.—W. W., Staiores Villa, Staines Road, Sunbury, Middlesex.

TO MARKET NURSERYMEN.—Situation wanted in a Market Nursery by a young man accustomed to Growing Ferns and General Market Stuff. Eight years' experience.—H., Mr. Barrett, Hextable, Swanley Junction, Kent.

TO MARKET NURSERYMEN.—Wanted, re-engagement in Market Nursery.—Age 22; well up in Plant Growing and Making up Cut Flowers. Can Serve Customers.—G. D., 3, Rose Terrace, Stonbridge Road, Halesowen.

TO NURSERYMEN.—Situation wanted to Grow Plants for Market, under a Foreman. Age 21. Good references.—T. R., 29, Greenside Road, Shepherds' Bush, W.

TO NURSERYMEN and GENTLEMEN.—A respectable youth requires a situation in a Nursery or Gentleman's Garden. Bothy preferred. Experienced. Good references.—WALTER RITCHIE, Mayfield Road, Frant, Sussex.

TO GARDENERS, &c.—Situation wanted by Lad (age 17). Three years' experience in Fires, Glass, and Outdoor Work.—Ven. Archdeacon MOUNT or THOMP-SETT, Gardener, Vicarage, Cuckfield, Sussex.

TO GARDENERS, &c.—Wanted by a strong, active, and willing youth (age 18), abstainer, situation in a Gentleman's Garden. Can be thoroughly recommended.—JACKSON, South Lodge, Clendon, Winslow, Bucks.

TO GARDENERS, &c.—Will any Gardener take a steady man (age 30), into his garden. Has been in the Garden before. Good character. Not afraid of work.—C. J., Mrs. Medcraft, Marsh Gibbon, Bicester, Oxon.

TO GARDENERS.—Two Brothers (age 16 and 17) require situations in Gardens. Excellent characters. Bothy preferred.—F. AND E. SHERBOURNE, Great Rissington, near Barford, Gloucestershire.

TO FLORISTS, &c.—Wanted, a situation, by a young man. Thoroughly well up in Cut Flower Trade and Floral Decoration; first-class Maker-up of Bouquets, Wreaths, Crosses, &c.; also a knowledge of Seeds and Plants. Has had Management of Florist's Shop in a fashionable provincial town.—Apply, stating salary, to S. S. S., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

TO NURSERYMEN and SEEDSMEN.—Situation wanted by a man who has had ten years' experience in London Trade. Good recommendations. Age 31.—C. J., 12, Victoria Road, Batters Park, S.W.

TO SEEDSMEN or NURSERYMEN.—Advertiser, age 30; thorough knowledge of Seed Business, good Writer, can keep Books, and Travel. Seventeen years' undeniable references.—W. G., 23, Charles Street, West Lincoln.

HOLLOWAY'S PILLS.—In all the disturbances of circulation, digestion, and nervous energy, which at times oppress a vast portion of the population. Under the wholesome, purifying, and strengthening powers exerted by these excellent pills, the tongue becomes clean, the appetite improves, digestion is quickened, and assimilation rendered perfect. Holloway's medicine possesses the highly estimable property of cleansing the whole mass of blood, which, in its renovated condition, carries purity, strength, and vigour to every tissue of the body.

"PRESIDENT CARNOT."

NEW AND SELECT STOCK OF BRUSSELS SPROUTS.

FROM A PHOTOGRAPH BY DUCKMANTON, GAINSBOROUGH.

JOHN ETHERINGTON DIXON having purchased the entire Stock of this extraordinary variety from Mr. JOSEPH BENTLEY, purposes sending it out for season 1888. It has been proved by all who have grown it to be the best extant for size of knobs and habit of growth. It grows similar to a pyramid, and has been selected with the greatest care possible, so that it may be depended upon as something specially good.

TESTIMONIAL.

From Mr. ALBERT WIPF, Gardener to NATHANIEL CLAYTON, Esq., J.P., *Eastcliff Gardens, Lincoln.*

SIR,—Your strain of Brussels Sprouts is the best in cultivation. I tried it the first year, alongside three of the leading strains, but it proved so much SUPERIOR TO THE OTHERS that I have grown no other since.

The exhibit of your strain of Brussels Sprouts at our Chrysanthemum Show will not easily be forgotten by those who were present, drawing high encomiums from the Judge, Mr. J. WRIGHT, "*Journal of Horticulture.*"

To Mr. JOSEPH BENTLEY, *January 5, 1888.* [The above is only one out of many received.]

OPINIONS OF THE PRESS.

A BROODINGNAGIAN BRUSSELS SPROUT.—To local vegetarians a paradise is shortly in store in the shape of a succulent Sprout of mammoth proportions, the only seed in existence of which has been secured by Mr. JOHN ETHERINGTON DIXON, Seedsman, Lord Street. This new variety is known as the PRESIDENT CARNOT BRUSSELS SPROUT, and the plants are of huge size and symmetrical proportions. The Sprouts being of excellent flavour, market gardeners will put in a strong demand for the limited quantity of this seed in the market.—*From the "Retford and Gainsborough Times," December 30, 1887.*

Mr. J. ETHERINGTON DIXON has some extraordinary BRUSSELS SPROUTS of a new variety, as may be judged by the name, "PRESIDENT CARNOT," the seed of which will be sent out during the coming spring in sealed packets. The product of the first year's growth are of a truly wonderful size, firm in the heart, the plant being of a pyramidal shape, and very thickly studded with large sprouts.—*From the "Retford, Worksop and Gainsborough News," December 24, 1887.*

Price, 2s. 6d. per Packet.

Free by Post, 31 Stamps. Usual Discount to the Trade.

JOHN ETHERINGTON DIXON.

(Second Son of the late Edmund Philip Dixon, Seed Merchant, Hull.)

LOUGHBOROUGH, LEICESTERSHIRE.

ORCHIDS.

An Immense Stock of recently imported plants compels a sale of the established plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained and great bargains. See public Journals for high prices recently obtained. The Special Offer affords a paying investment to anyone with glass at command, which should not be overlooked; such plants may never again be offered to the public and the trade.

Lilium auratum.—Eighth arrival of 10,000 Bulbs, the best that money can buy anywhere, 4s., 8s., and 10s. per dozen. Specially imported Non Plus Ultra bulbs, 2s. 6d. each; very liberal allowance to the Trade.

Lilium album Krætzleri.—The most lovely white Lily grown; throws seven to ten flowers, which sell in market at 2s. per dozen; beautiful and rare, 1s. each, 10s. per dozen.

Lilium speciosum rubrum cruentum.—The dark form of this lovely Lily, most exquisitely marked, 1s. each, 10s. per dozen.

Lilium auratum, platyphyllum, rubro-vittatum, crimson, striped with gold; **virginale,** pure white, and spotted, with gold band. All these lovely new and distinct forms of auratum, suitable for show purposes, very fine bulbs, 5s. each.

Lilium Harrisii, 10s. per dozen; and all other Lillies equally cheap. Bankers Silver Medal awarded August, 1887.

Japanese Novelties—80 varieties Iris, Tree Pæonies, Maples, Camellias, Azaleas. Please apply for special offer to

W. GORDON,
THE NURSERIES, AMYD PARK ROAD,
TWICKENHAM, MIDDLESEX.

The following CATALOGUES have been posted to all my Customers:-

HARDY PERENNIALS.

This is the most complete Catalogue ever published, giving full descriptions of the best of each family, colour of flowers, when they bloom, and a host of other valuable information, enabling the Amateur to make a selection of plants to make a GAY BORDER during Spring, Summer and Autumn, requiring but little care after once planted.

CHRYSANTHEMUMS.

Containing selections of the best of the different groups, all fully described and illustrated. It contains every novelty of note, including the new late-flowering Governor of Guernsey, probably the finest yellow ever sent out. A beautiful coloured plate accompanies each Catalogue.

HARDY CLIMBERS.

An immense collection of Clematis, Jessamine, Wistaria, Ampelopsis, Ivy, and every other variety worth growing.

PAONIES—TREE & HERBACEOUS.

An immense collection of all the best in cultivation.

CARNATIONS AND PICOTEE.

An immense stock of every variety worth growing, all fully described and many of the best figured.

PYRETHRUMS, PHLOX, PENTSTEMONS.

These are enumerated and described in addition to other kindred families—Delphiniums, Gaillardias, Pinks, Fancies, &c.

FERNS AND PRIMULAS.

These are also fully described. The collection of the former is a very representative one, while the latter contains every species and variety worthy of cultivation.

Copies of the above described CATALOGUES may be had, gratis and post free, upon application.

THOMAS S. WARE, HALE FARM NURSERIES, TOTTENHAM, LONDON.

TREES and SHRUBS for the SEA COAST. CATALOGUE Free on application. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

CANNELLS

ARE KNOWN AND RENOWNED FOR HAVING ONLY THE BEST STRAINS IN THE WORLD.

OUR

PRIMULAS, CINERARIAS & CYCLAMEN.

Our exhibits at all seasons at the great shows are acknowledged per excellence the greatest feature.

OTTO ANDREA, Esq., Central Valley, Orange Co., New York, U.S.A., February 9, 1888.

"I have received both shipments of your Violets (1300) in good order, and the first lot is now in bloom; the second lot will be in bloom next month."

Mr. C. BRASSINGTON, Burton's Buildings, New Street, Chesham, New Canock, Staffordshire, February 9, 1888.

"The Parsley seed I had of you—Beauty of the Parterre—was simply grand; nothing to equal it in this part."

Mr. R. R. OSWALD, Birkenhead, February 10, 1888.

"Your seeds of exhibition flowers are the best I ever grew. I took eleven first prizes with them last year."

WALTER FURZE, Esq., Roselands, Broom Road, Teddington, February 20, 1888.

"What splendid Primulas you showed at the Royal Horticultural Society on Tuesday last."

D. HINCKS, Esq., Hay, R.S.O., February 28, 1888.

"I was very pleased with the plants you sent me some weeks ago. They were beautifully packed, and are now looking wonderfully fresh and well. Your Cyclamen were splendid. Sorry I did not know of your firm before."

Mr. A. HOLTGATE, Cobden Villas, Oldfield Avenue, Drawce, February 29, 1888.

"The seeds I had from you last year produced the grandest Astera I ever saw."

H. CANNELL & SONS, SWANLEY, KENT.

Spring 1888.

NEW WHITE ROUND POTATO, WEBBER'S "EARLY WHITE BEAUTY." Awarded First-class Certificate, Royal Horticultural Society, September 21, 1887. (See Gardeners' Chronicle, January 28.)

The many Testimonials received from well-known authorities speak so well for the excellence of this splendid new white-skinned Potato, that a lengthy description is unnecessary. In short, it possesses every good quality. It is of handsome appearance, with shallow eyes, and the superior Beauty of Hebron, both for quality and productiveness, whilst its dwarf habit and extraordinary quickness of maturation make it invaluable for early work. It has been tried on all kinds of soil with most satisfactory results, producing in every case a fine crop entirely free from disease. Send post-card for Illustration and read Testimonials. Price per lb., 1s.; 7 lb., 6s. Sample pound, post-free for sixteen penny stamps. Address, F. WEBBER, Quarry Hill Nursery, Tonbridge.

80,000 CLEMATIS, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, repotted into 5 1/2-inch pots, 2s. 6d. each. Descriptive LIST on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

JOSIAH H. BATH, 1 and 3, York Street, Borough Market, S.E., offers the following varieties of SEED POTATOS:—

- | | |
|--------------------------|---------------------|
| Rivers' Royal Ashleaf | Schoolmaster |
| Myatt's Prolific Ashleaf | Reading Hero |
| Old Ashleaf | Snookflake |
| Mons. Pride | Paterson's Victoria |
| Beauty of Hebron | Early Don |
| White Elephant | Early Rose |
| Magnum Bonum | Regent |

And other leading varieties. Prices on application.

CHRYSANTHEMUMS, 600 varieties, best and newest, strong Cuttings from general collection, now ready, 1s. 6d. per dozen, 10s. per 100; plants in January, 2s. 6d. per dozen, 16s. per 100. W. E.'s selection cheaper. Many of the best prizes in the country have been taken from plants and cuttings supplied by me. Mons. Delaux's grand set of 100 sorts, and other new varieties, at reasonable prices. See CATALOGUE, with Essay on Cultivation, 2 stamps. WM. ETHERINGTON, Chrysanthemum Grower, Swanscombe, Kent

DANIELS BROS., The Royal Seedsmen, NORWICH.

S. SHEPPERSON,

FLORIST and SEEDSMAN,

PROSPECT HOUSE, BELPER,
DERBYSHIRE,

Begs to inform the readers of this Paper that he is prepared to execute orders for the following plants, all of which are of the very finest possible strains that money can buy. They have all been grown on the Derbyshire Hills, and are therefore very hardy, and warranted to succeed and bloom well. All carriage free for cash with order.

DESCRIPTIVE LIST of Florist Flowers,
4d. stamps, or free to customers.

PANSIES.—A great specialty Five Silver Cups and other Prizes awarded during 1887, probably the best collection in England; the cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, twelve for 3s., twenty-five for 5s. 6d., Carriage free for Postal Order.

FANCY PANSIES.—Unnamed, six for 1s., twelve for 1s. 6d., twenty-five for 2s. 6d., Postal Order. All different and first-class sorts, free.

CHRYSANTHEMUMS.—Great special culture, the best and most distinct varieties only, of large-flowered, incurved, reflexed, early and late bloomers, pompons, Japanese, &c., including many grand new varieties by the best English, Continental, and American raisers. Twelve distinct varieties, named, well rooted plants, for 2s.; twenty-four for 3s. 6d., free.

GRAND NEW CHRYSANTHEMUMS.—The cream only of the new varieties of 1886 and 1887. Six for 2s., twelve for 3s. 6d., named distinct varieties.

HOLLYHOCKS (Double).—Charters' very finest and most select strain. Twelve varieties for 2s. 6d., six for 1s. 6d.; six extra strong for 2s., Postal Order, free.

CANTERBURY BELLS.—Grand new colours and new forms, double and single Telescope, Candelabrum, and other varieties. Twelve good plants, to bloom well, for 1s.; twelve extra strong for 1s. 6d., Postal Order, free.

PURE SNOW-WHITE AURICULA.—One of the most beautiful hardy spring flowering plants in cultivation. Two for 1s., free.

AURICULAS.—A really grand strain of this deliciously scented old-fashioned favourite flower, including Turner's Alpines, Dean's new lace varieties, Dewsbury's Giant, and other really fine sorts. Good plants, that will bloom well this spring, three for 1s., six for 1s. 9d., twelve for 3s., all free.

POLYANTHUS.—Finest strain grown, fine large trusses and blooms, and splendid colours. Cannot be surpassed. Twelve for 1s., twenty-six for 2s., 100 for 7s., free. All good blooming plants.

POLYANTHUS and PRIMROSE.—Jack-in-the-Green, Hose-in-hose, and other rare and curious forms unnamed. Six distinct sorts for 1s. 6d., twelve for 2s. 6d., free.

THE NEW DOUBLE SCARLET GEUM.—Quite hardy. Free bloomer. Grand for cutting or decoration. Twelve for 1s., twenty-five for 2s., Postal Order, free.

CARNATIONS, PICOTEES, and CLOVES.—Strong plants, from finest show flowers only, including many new sorts. Will give a mass of bloom. Twelve beautiful varieties for 2s. 6d., six for 1s. 6d., free.

SCARIOSA (Double).—A really fine hardy plant for garden decoration or cut flowers. Many fine colours. 1s. per dozen, free.

PRIMULA CASHMERIANA.—Splendid hardy mauve-coloured spring flowering plant. Three for 1s., free.

COLLECTION of twelve HARDY BORDER PLANTS, distinct and useful for decoration and cutting purposes, for 2s., free.

WALLFLOWERS.—Double German, Cranford Beauty, Ware's dark red, and Kershaw's bright red. 1s. per dozen, free.

FOXGLOVES.—Gloxinia-flowered, Dean's grand new large spotted varieties, very fine, twelve for 1s. 6d., six for 1s., free.

ALSO the FOLLOWING FREE-BLOOMING HARDY PLANTS:—
Pure white Thrift, fine edging and spring flower; Malva Sabrosa alba and rosea, beautiful pure white and rose, blooms all summer; Sweet Williams, the finest dark and giant Auricula-eyed; Arabis alba, white spring-flowering plant, beautiful variegated foliage.

STRAWBERRY PLANTS.—Selected crowns, transplanted, Black Prince Improved, British Queen, Alpha, Pauline, Sabrosa, Viscontessa II. de Thury, Duke of Edinburgh, King of the Earlies, and other extra sorts, 3s. per 100, free. Also the Captain (Laxton's) twenty for 1s., free.

S. SHEPPERSON,

Florist and Seedsman,

PROSPECT HOUSE, BELPER,
DERBYSHIRE.

SHARPE'S NEW PEAS.

SHARPE'S VICTORY.

First-class Certificate R.H.S., 1886. This magnificent variety surpasses everything we have ever seen. The habit of the plant is vigorous and much branched. Pods produced in pairs, occasionally three together, well filled with large Peas (ten to eleven), of extra fine flavour, and deep green colour when cooked. Height 2 feet.

Price, 3s. 6d. per Packet.

SHARPE'S QUEEN.

A grand Blue Marrow. Height 2 feet. Pods large, deep green, with large, green, deliciously-flavoured Peas. It is so continuous a cropper that a constant supply may be maintained by it alone after the first crop is ready.

Price, 3s. per Pint Packet,
1s. 6d. per Half-pint Packet.

SHARPE'S TRIUMPH.

An improved Stratagem, and the finest Pea for Market Gardeners; is a Blue Wrinkled Marrow Pea, of exquisite flavour. Pods large and well-filled. Height 2 to 3 feet. On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod.

A. C. WILKIN, Esq., *Tiptree, Kelvedon (a large Grower of Peas for Market)*, says:—"Sharpe's Triumph is a model and grand pattern of a Pea, about 2½ feet high, loaded with pods of a very fine size, dark green coloured, and Peas of a rich and delicious quality."

Price, 1s. 6d. per Pint Packet,
1s. per Half-pint Packet.

SHARPE'S PARAGON.

An improved Telephone, and a hardy, early, prolific Blue Marrow.

Price, 2s. 6d. per Quart,
1s. 6d. per Pint.

WEBBS

HYBRID MIMULUS.

Per Packet, 1s., post-free.

From Mr. E. COOPER, Gardener to the Right Hon. J. Chamberlain, M.P.

"Your New Hybrid Mimulus is of first-class quality, and it has given me great satisfaction, both for the size of the flowers and their splendid markings."

WEBBS' NEW IMPERIAL TEN-WEEK STOCK.

Robust in habit of growth, producing long, massive spikes, which are unequalled for exhibition and decorative purposes.

Mixed colours per pkt., post-free 1s. 0d.
Eight distinct colours (separate) 3s. 0d.

From Mr. B. WYATT, Camden Place, Stourport.

"I have grown some splendid specimens of your New Imperial Ten-week Stocks. I had plants fully 2 feet in height, with spikes of bloom (in many cases) a foot in length."

WEBBS' PRINCESS ASTER.

A splendid new variety, of pyramidal habit, producing a dense mass of richly-coloured and finely-formed flowers.

Mixed colours per pkt., post-free 1s. 6d.
Eight distinct colours (separate) 3s. 6d.

From W. MONTGOMERY, Esq., Kirkiutulloch.

"I have grown your Asters for a good many years alongside some from other noted Houses, and am proud to tell you that 'Webbs' Asters' are the Asters of the day."

WEBBS' STERLING POPPY.

Our new strain is entitled to a place in every garden, on account of its gorgeous colours and free-blooming qualities.
Per packet, 1s., post-free.

From Captain PAUL, Earnsley.

"Captain Paul has much pleasure in informing Messrs. Webb & Sons that their New Sterling Poppy turned out splendidly."

SATURDAY, MARCH 10, 1888.

THE FUTURE OF GARDENING.

"NOTHING is so likely to happen as the unexpected," was an old saw made popular by the late Lord Beaconsfield, and I may say that it is especially true as applied to gardening. Our failures often lead to our greatest successes, and our whilom successes not unfrequently tempt us to become negligent of those trifles which, taken collectively, conduce to, even if they do not actually command, success. "Ah!" said a gardener to me lately, "gardening is not what it used to be;" and then he added, in an awed kind of a whisper, "we sell everything now which the family do not require." "And why not?" I replied. "Why should not a garden be managed at a profit as well as a farm, or a stable of horses for breeding, or the shorthorns, or sheep, or poultry, or bees, or the hundred and one other things that go to make up the success of land culture in our country to-day? The ordinary rough and ready methods of farm culture and management common ten or twenty years ago lead to ruin, and the only way in which we can make land culture profitable now is by the organisation and focussing our brain-power on limited areas, glass protected or not as the case may be. This being so, I see no objection to the principle of self-help being carried out at Chiswick and elsewhere, indeed everything honest should be tried, and every nerve strained before we allow the only national and experimental scientific garden in England to fall to the ground. I have yet to learn why the best scientific schools and gardens should not be trading institutions, and to a certain extent if not altogether self-supporting. If "labour is honourable," as it is generally acknowledged to be, why should not trade also be honourable? As a matter of fact it really is so, and it is not difficult to point to trading institutions that are really scientific to the highest degree and profitable as well.

Where is there at the present moment a school of gardening equal to the nurseries of Messrs. Veitch & Son? Their establishments are

managed as paying concerns, and yet what purely scientific and State-aided garden can produce such a record of new plants introduced from abroad, or, as hybrids, raised under cultivation? In a lesser degree the same may be said of other nursery gardens in London and throughout the provinces. Let us take a few other examples, say, Doulton & Co.'s pottery or Price's Patent Candle Company—both concerns managed scientifically at a profit, and the former especially one of the best art schools in the kingdom, while the other has given us in glycerine, Gishurst compound, &c., from its once waste chemical products, results by no means to be despised. Any trade or profession may be both profitable and scientific if brain-power and energy are focussed on a limited area; and why should gardening be any exception to the general rule? Are not the shorthorns sold periodically from the Albert Model Farm? Why should gardening be exempt from that commercial test now applied to every other profession or science? There is scarcely a titled family in England that does not augment income by trade. It is, therefore, a matter of indifference whether they get rent for land or money for coals or iron or timber from their estates; and I see not how it matters whether you trade in coal or in Cauliflowers. The output of the one commodity may be as scientific as the culture of the other; for if science is anything to-day she is cosmopolitan and catholic, and ennobles all she touches, illumines all of which her light shines. After all, it is the individual that commands success in science as in most other things. Darwin, with his antiquated measuring-glass, and anything but exactly indexed 3-foot rule, did more for research than all the State-aided people put together.

The main drawbacks to trade in ordinary gardens, however, are the following:—As a rule the hothouses and fruit-houses are antiquated, badly lighted, and expensive to heat efficiently; then, if the place has to be kept clean, and the lawns closely shaven, for the pleasure only of the employer, he must of course pay for that, as he pays grooms for his racehorses, or sailors for his yacht. As a rule, an acre of land covered with cheap glasshouses, all heated efficiently from two or three boilers, will prove more economical and profitable than the usual run of barn-like structures existing in private gardens; so in the culture of hardy fruits, a bit of selected soil well planted with young fruit trees, vegetables, and flowers, will pay far better in the long run than will a gentleman's garden of a much larger area; but at the same time, if any gentleman likes to sell his surplus garden produce, by all means let him do so, and do not let us attempt to stop progress by saying that this was not the rule years ago. After all, we cannot stand still; new ways, new methods, new fashions, and new ideas will arise, and these in gardening, as in other matters connected with the culture and profitable management of land. The old gardeners took trouble to learn the way so to grow giant *Ericas*, *Stephanotis*, *Ixoras*, and to fill flower-beds with plants by the million, just as now-a-days they have to learn the growth of decorative plants, the mode of production of cut flowers, and the culture of alpine and herbaceous plants or Orchids. Evolution goes on in gardening as in all other things, and those young gardeners who are wise will take care to prepare themselves for the management of gardens of the self-supporting kind. After all, the one thing is as easy as the other, when once you know how it is done. The main thing in gardening as in other arts is to decide what you will do; in most cases the employer will decide

for you, and then one's duty becomes clear. But as to the question as to whether gardens are to be maintained for science, for pleasure, or for profit, that rests with their owners; hut we may at any rate rest assured that whenever a garden is maintained at a profit there will be none the less pleasure derivable from it, and, as in the case of our best nursery gardens, science will not be far behind her highest standard, even if she does not now and then get a step or two ahead of the schools, in such well-managed places. *F. W. Burbidge.*

CRASSULA LACTEA.

HERE is an old acquaintance, and one admirably suited for the greenhouse of the amateur, or even the window of the cottager. If kept dry in the winter-time it will, like many other Cape plants, bear a comparatively low temperature with impunity. An admixture of mortar rubbish with ordinary garden mould suits it very well. The thick fleshy leaves are ovate-acute, with a row of white dots within the margin. The flowers are produced copiously, are snow-white, and expand in the winter season, on which account we call attention to the plant as one very desirable for cultivation even in these days of novelties. For the drawing whence our illustration (fig. 47) was made we have to thank Mr. Gilbert Davidson, of Wernoleu, South Wales.

NEW OR NOTEWORTHY PLANTS.

PHALÆNOPSIS DENTICULATA, *n. sp.**

This curious plant flowered with Messrs. Hugh Low & Co. in December last. Mr. Hugh Low kindly informed me that the plant comes near *Phalænopsis sumatrana* Marie, having green leaves about 6–7 inches long, by 2–3 inches in width, and roots with light green points. The peduncle at hand is two-flowered, and will, no doubt, improve a good deal when the plant becomes established. The sepals and petals are oblong-lanceolate, acute, white, with brown, mostly roundish spots. The lateral partitions of the lip are ligulate, toothletted retuse outside, with a callosity at the base, and a transverse keel running in an oblique manner outside. Mid-partition concave, ligulate, acute, toothletted at the anterior margins, with a long keel over the middle rising very high towards the apex. There are two forcipate callosities, one on the disc, the other at the very base of the mid-partition. Colour white, side-partitions lightest-yellow at the anterior side, with three mauve lines on each side of the mid-partition. Column enlarged by an angular part at the base. I am very thankful to state that Messrs. Hugh Low & Co. have favoured me with several identical peduncles. The denticulate margin is only known in *Phalænopsis pallens*, in which the whole top is widely enlarged. The concave mid-partition is quite peculiar. *H. G. Rehb. f.*

ODONTOGLOSSUM BODDAERTIANUM, *n. sp.†*

This is near to *Odontoglossum odoratum*, Lindl., yet it is quite distinct in the anterior major part of

* *Phalænopsis denticulata*.—Radicebus folisque *Phalænopsis sumatrane* Marie; pedunculo tenui bifloro (semper?); sepalis tepalis que cuneato-ligulatis acutis; labello unguiculato tripartito, partitionibus lateralibus ligulatis extus retusis denticulatis, basi versus umboatis, extus transverse obliquo carinatis, partitione mediana cuneato-oblongo ligulata acutiucula, antice denticulata concava, carina antorsum elevata per discum, callis bifidis biseriatis in disco inter partitiones laterales et in basi partitionis mediane; columna basi utrinque angulata. *H. G. Rehb. f.*

† *Odontoglossum Boddaertianum*, *n. sp.*—Affine *Odontoglossum odorato*, Lindl.; sepalis tepalisque lancels acuminatis; labelli lobis basilariibus erectis semi-ovatis, lobo medio basi utrinque triangulo seu semi-elliptico auriculato, auriculis divaricatis, parte antica prorecta magna lancea acuta, seu acuminata seu cuspidata, minutissima denticulata, callis in basi parallelis geminis bidentatis; columna validiuscula. Ex Venezuela coll. Bungeoth. *H. G. Rehb. f.*

the mid-lacinia of the lip, having on each side a spreading angle at the base. It has been compared with *Odontoglossum Sanderianum*, a very rare plant that appears to be often very ill understood, or oftener quite misunderstood. The last named plant has a much broader lip, the anterior broad part usually pandurate, without any such spreading angles. The basilar part of the lip, the two semi-oblong valves, are much broader.

Our plant has lanceolate acuminate yellow sepals, with dark cinnamon markings, which appear to have a tendency to longitudinal extension. On the pallid outside you may see them very well, though pale too. The lip is white; its basilar lobes are semi-oblong, upright, with some mauve or purple spots. The mid-lobe has spreading small basilar angles, the mid-part is much larger, lanceolate, acuminate, toothletted, though not in a conspicuous manner. There are two parallel bidentate calli at the base, and a few purple spots around. The column is whitish-yellow, with a few dark brownish-purple spots, and the usual linear falcate markings.

I have not seen the plant, nor can I say whether when well-grown it is racemose or paniculate, which is a most disagreeable state of things for me. This will, no doubt, now be decided by Messrs. Linden, provided their plants are yet established.

I am afraid my first knowledge of the plant, vague as it is, is five years old. Mr. Peacock, of Hammersmith, once the king of succulents, now an enthusiastic collector of Orchids, sent me a flower in April, 1887, that comes very near to this, though a little doubt is left. Notwithstanding my request, I got no additional information, nor any more material, and thus I was deprived of the satisfaction of doing justice to the gentleman and to the plant.

Monsieur le Professeur Dr. Boddart van Cutsem, of Ghent, celebrated as an enthusiastic Orchidist, has twice sent me very good materials (dense racemes), which enabled me to get a rather good idea of the plant. Being indebted for all my positive knowledge to this gentleman I have named the *Odontoglossum Boddaertianum*, and now Monsieur Lucien Linden, Director of l'Orchiculture Internationale, Brussels, sends me recently developed flowers from specimens collected and sent by one of the assiduous collectors of this company, Mr. Bungeoth. *H. G. Rehb. f.*

CYPRIPEDIUM × GODEFFIANUM, *n. hybr. Angl., Cookson.*

This is really a fine thing,—one of the best hybrid *Cypripedia* I have seen. It was kindly sent me by Mr. Norman C. Cookson, Oakwood, Wylam-on-Tyne. Its parents are *Cypripedium hirsutissimum*, male; and *C. Boxalli*, female.

The leaf is a span long, nearly 2 inches broad, very stiff, with a fine narrow, pellucid, cartilaginous margin. The strong peduncle is covered with reddish stiff hairs, as is also the ovary, which is nearly equal to half the bract in length. The bract has small dark spots at its base. The oblong median sepal is of the lightest yellow, only pure at the border, the whole disk being covered with sepia-brown, whereon circles of the lightest yellow are to be seen, with a few apical spots at the base, on a light yellow area. The lateral sepals are oblong-acute, of the lightest yellow, with a few rows of dark spots at the base in the centre. The ligulate petals are much broader, blunt at the top, finally undulate at the base in the upper half. The spreading petals constitute the chief ornament of the flower. They are of a gorgeous purple-mauve at the exterior half, running out in a mauve line from the middle to the base. The remaining parts over and under the line are of the finest sulphur with innumerable fine blackish-red spots. The colours are not dull, as is the case in so many hybrids, but bright and clear. Outside the petals are the lightest sulphur-coloured, with dark brown markings at the base, and a line of the same colour in the middle of the anterior part, where there is a delicate wash of the most pallid purple-mauve. The lip is rather slender, blunt, extinguisher-shaped, light brown, yellowish underneath. The staminode is nearly square, apiculate, with a knob-like projection at the top, and another at the base, yellow.

I have no doubt admirers of hybrids will like this plant, the more so as the "blood" of *Cypripedium hirsutissimum* appears to give a strong warranty that the plant will not grow like a weed, which is a fault in the eyes of purchasers of numerous hybrids. As I esteem the novelty so highly, it is an uncommon satisfaction to me to name it in honour of Mr.

confluent in lines, on a bright green ground, the darker colour of the petals, and the much darker lip. Although quite distinct as a garden plant, still the general characters of the two are so similar that I suspect both may have come from the same parentage, if not from the same cross. I can only suggest *C. insigne* and *C. Harrisonianum* × as

insigne type, while the varnished appearance of the sepals and lip show an approach to *C. Harrisonianum* ×. Of course the name is intended only as a fancy one, not as a Latin specific one. *R. A. Rolfe.*

ORCHID NOTES AND GLEANINGS.

DOWNSIDE.

AFTER seeing the large number of *Cattleya Trianae* spoil by fog it is a pleasure to see Mr. W. Lee's *Cattleya*-house bright at this season with many fine varieties of that plant. The view along the house discovers many hundreds of fine flowers, the frequently noted named varieties, such as *Osmani*, *Leeana*, *Dayana*, *Backhousiana*, *Emperor*, *Emiliae*, *eboracensis superba*, *alba*, *virginalis*, *Russelliana*, &c., standing out prominently even among a very beautiful class of undistinguished varieties. Among the light varieties *C. T. bella* with white sepals and petals, and pale rose lip; and *C. T. Vesta*, white with bright crimson front to the labellum, are both superb examples. Ranged along the centre of the *Cattleya*-house are many very fine and well sheathed *Laelia purpurata*, and *L. elegans*; and on one side are flowering the remainder of the *Laelia* anceps, among which *L. a. Veitchiana*, white with lilac-blue colour on the lip, is unsurpassed in its way, as are *L. a. Dawsoni* and *L. a. Schroderei* in theirs. The last is a very charming flower, with bluish sepals and petals—the latter crimson feathered, and a bright crimson lip. *Laelia (Brassavola) glauca*, *Cattleya Walkeriana*, and a fine show of *Ceologyne cristata*, in all its varieties, were also in bloom in the *Cattleya*-house, and in the lobby the commencement of the flowering of the collection of *Vanda tricolor* and *V. suavis*, *Chysis Chelsoni*, *C. bractescens*, *Goncidium splendidum*, *Epidendrum Endresii*, *Laelia harpophylla*, *Ceologyne conferta*, *C. sparsa*, and *Sarcochilus Hartmanni*.

Among the *Dendrobies* the true *D. nobile nobiliss* is the king, as the *D. splendidissimum grandiflorum* of Messrs. Veitch is likewise the best of the *Ainsworthi* section, for strength of growth (often 2 feet 6 inches), beauty of flower, and on every other point; their hybrid, *D. enosmum leucopteryum*, too with translucent milk-white flowers, is beautiful in the extreme; *D. luteolum chlorocentrum* also is finer than the type. The other *Dendrobies* in flower were various varieties of *D. nobile*, *D. Lowianum*, *D. Ainsworthii*, *D. Leechianum*, *D. endocharis*, *D. Kingianum*, *D. Wardianum*, and other species flowering at this season.

Of *Cypripediums* in bloom were noted the rare and curious *C. (Selenipedium) Lindleyanum*, in *Oechsels of Roraima*, p. 298, which has an apparently never-ending succession of flowers. *C. polatum* ×, *C. hybridum* ×, *C. chloroneurum*, *C. Meirax* ×—these are all hybrids of *C. venustum*, and very handsome when well grown. Among the *Sedeni* strain *C. S. candidulum* is a beautiful flower, as free to grow and bloom as the commoner form, and that is no slight recommendation. Also in bloom were *C. microchilum* ×, *C. barbatum Warneri*, *C. grande* ×, *C. Harrisonianum nigrum* ×, &c.; and with them were some well bloomed *Odontoglossum Roezlii*, *Zygotopetalum rostratum*, many varieties of *Calanthe Regnierii*, *Saccolabium curvifolium luteum*, *S. gemmatum*, *Dendrobilium glumaceum*, *Epidendrum cariniferum*, and other minor but interesting things.

The new *Phalenopsis*-house contained a good show of bloom, and here, as in other places where it has been tried, the best possible account is given of the benefit to the plants from an undergrowth of foliage plants such as *Tradescantia*, *Pellionia*, *Fittonia*, *Cyrtodeira*, and other subjects not liable to harbour insects. Certain it is that in a house so arranged a healthy, moist atmosphere is always assured. The bulk of the flowers were borne by *P. Schilleriana* and *P. Stuartianum*, and with them are some good examples of *P. amabilis*, *P. rosea*, *P. Sanderiana*, and one *P. intermedia Portei*. *Acrides*

FIG. 47.—CRASSULA LACTEA: FLOWERS WHITE. (SEE P. 296.)

Godseff, the excellent assistant of Mr. F. Sander. *H. G. Rehb. f.*

CYPRIPEDIUM ELECTRA, n. hybr.

This is a pretty hybrid of *Veitchian* origin, and of the same type as the one recently described by me as *C. Galatea*, and like that one the record of the parentage has unfortunately been lost. The chief differences consist in the very broad white border of the upper sepal, and the circumstance that the spots are almost

the most likely parents. The leaf is quite pale glaucous green, with darker reticulations. Upper sepal green, with very dark brown spots, almost confluent in lines, and a very broad pure white border. Petals varnished, veined, and reticulated with purple-brown on a paler ground, and with a few small dark spots on the inner half near the base. Lip shining purple-brown. Staminode much like that of *insigne*, and with the characteristic tooth. The general shape of the flower is of the

Lecanum and the pretty *Angraecum citratum* also contribute to the show in this house.

The cool-houses have their plants in their usual order, the *Masdevallias* being especially good. There is a fine representative collection of them at Downside, and there are always some interesting things in bloom among them, even when the season of the showy ones is not on. A noble example of *M. Shuttleworthii* presents this plant in its true aspect, and stamps it as one of the most beautiful of the neat-growing *Masdevallias*. *M. melanoxantha* has fleshy flowers of a dull red; *M. Veitchiana grandiflora* is the grandest of all coloured *Masdevallias*; *M. triangularis* neat and floriferous, and the several brilliant orange and red forms of *M. ignea* invaluable for effect in winter and spring.

The *Odontoglossums*, on account of the dry nature of the soil and the powerful effect of the sun in this district, are said to give more trouble to keep free from thrips in this district than in some others; nevertheless the stock is in good order, and commencing the season's flowering well with *O. crispum*, *O. Pescatorei*, some pretty forms of *O. Wilckeanum*, and *O. Andersonianum*, *O. Rossii majus*, *O. ramosissimum*, and some showy forms of *O. odoratum*, which is really a handsome and useful Orchid, whose chief fault is that it has become common. The *Lycaste*-house, which is kept 5° warmer than the *Odontoglossum*-house, has a fine display, in which, of course, the several plants of *L. Skinnerii alba* are the most attractive, although two or three which have just escaped being white, by being a pure pink, are very handsome, especially the one named *delicatissima*. *Odontoglossum Cærstedii*, with its snowy-white flowers, and the scarlet *Sophranitis*, also form beautiful objects in this house. *James O'Brien*.

ORCHIDS AND OTHER PLANTS OF RORAIMA.

Mr. Im Thurn, in his account of the plants observed during the Roraima expedition, recently published in the *Transactions of the Linnean Society* (July, 1887), speaks thus of the Orchids of the swamp district of Roraima half way up the mountain:—

"*Sclenipedium Lindleyanum* (Rehb. f.), with huge branched flower-stems, each bearing many blooms, the whole plant—flower, leaf, and stem alike—velvety in texture, and of various shades of one colour, the colour of sunlight as it falls through green young Beech leaves; the beautiful *Zygopetalum Burkei* (Rehb. f.*), with flowers seeming like gigantic, pale coloured Bee Orchises (*Ophrys apifera*, Huds.), but far sweeter in scent; in great abundance the rosy-flowered *Pogonia parviflora* (Rehb. f.), which recalls in habit our English wild Tulip (*Tulipa sylvestris*, L.); and to mention but one more among many, *Epidendrum elongatum* (Jacq.), its stems varying in height from 1 to 8 feet, its Verbena-like clusters of flowers varying in colour in different plants, some pale yellow, some fawn colour, many pure rich pink, dark purple, and even mauve. This last-mentioned Orchid, it may be noted in passing, is one of a group to which I shall presently refer.

"The effect of the whole is as of an alpine meadow, coloured in early summer by innumerable flowers of the brightest and most varied tints.

"If this tall vegetation be anywhere parted by the hand of the curious traveller, underneath it is seen a carpet of other low-growing plants—*Pæpalanthus Schomburgkii*, *P. flavescens*, *Drosera communis*, a pretty little Orchid, *Spiranthes bifida*, Ferns, *Lycopodiums*, and sphagnum-like mosses.

"One, perhaps the most remarkable plant of the swamp, has not yet been noticed. It is the South American Pitcher plant, *Heliamphora nutans* (Benth.) which grows in wide-spreading very dense tufts in the wettest places, but where the grass happens not to be long. Its red-veined pitcher leaves, its delicate white flowers raised high on red-tinted stems, its sturdy habit of growth, make it a pretty little picture wherever it grows. But it attains its full size and best

development, not down here in this swamp, but up on the ledges on the cliff of Roraima, and even on the top—

"The vegetation of the drier rocky patches is very different. A few shrubs of from 4 to 8 feet in height, a very few stunted and gnarled trees are there, a few single specimens of the one Roraima Palm (*Geonoma Appuniana*), which, as will presently be told, is much more abundant higher up; but more abundant are very dwarf shrubs of curiously alpine aspect, such as *Gaultheria cordifolia*, and various trailing plants, such as a Blackberry (*Rubus guianensis*, a Passion-flower, or a few Orchids and Ferns.

"Of the Orchids the most noteworthy is *Oncidium nigratum* (Lind), its delicately thin but wiry and much-branched stems, 5 feet high or more, seeming to float in the air a crowd of innumerable, tiny, butterfly-like flowers of cream-colour and black; but two others (*Zygopetalum Burkei* and *Epidendrum elongatum*), which we have already seen in rank luxuriance in the wetter parts of the swamp, grow also on these drier parts, but are here much reduced in general habit, though with larger and brighter-coloured flowers.

"Of the Ferns the most striking are a beautifully delicately cut *Schizaea* (*S. dichotoma*, Sw.), and a very remarkable *Gymnogramme* (*G. elephoglossoides*, Baker), of which more hereafter.

"*Cattleya Lawrenceana* is doubtless the one collected by the Schomburgk brothers, and enumerated by Richard Schomburgk as *C. pumila*, for it appears to be the only representative of this genus occurring on this side, at least, of Roraima, and this was the only side visited by the Schomburgks. It grows apparently not high up on the mountain, but on the gnarled tree trunks, close to the water, in the clefts through which the Kookenaam and some of its small tributary streams flow, at a height of about 3700—4000 feet above the sea. At the time of our visit Mr. Siedel, an Orchid collector, having set the natives to work to collect this plant for him, I have seen ten or twelve of these people come into camp, afternoon after afternoon, each laden with a basket (a good load for a man) full of these lovely plants, many of them in full flower. One day, I myself, having gone down to the Kookenaam to bathe, gathered, just round the small pool I chose for that purpose, two most glorious clumps of this Orchid, the better of the two having five spikes of flower, of which one bore nine, each of the others eight, blossoms; in all, forty-one of some of the largest and finest-coloured flowers ever seen on a single small plant, the roots of which easily lay on my extended hand." Full descriptions of this *Cattleya* have been given in the *Gardeners' Chronicle*, 1885, vol. xxiii., pp. 374, 375; and vol. xxiv., p. 168.

CYMBIDIUM EBURNEUM.

The culture of *C. eburneum* is not so well understood as it ought to be. The plants thrive best when placed in a shady part of the house; in fact it likes to be shaded from the sun by larger plants. It should be grown in good turfy loam, with leaf-mould and sand, and requires plentiful supplies of water at the roots. Under these conditions I have grown small plants with one growth, so that in a few years they produced plants with twenty or more large blooms. One we had last year produced thirty-six blooms, and it was grown in a 12-inch pot. *Cymbidiums* require repotting every two years. *J. Douglas*.

SARCOCHILUS HARTMANNI.

This interesting little Orchid, introduced from Australia in 1877, is still but rarely seen, although its flowers are distinct in appearance, and both pretty and freely produced. It is easily grown, succeeding perfectly in a mixture of fibry peat and sphagnum, and occupying a moist and rather shady position in the cool-house. The sepals and petals are white, each having numerous reddish-brown spots at the base; the small labellum is three-lobed, the centre lobe being somewhat saccate, while the side-lobes, which are striped with reddish-brown lines, stand erect on each side of the column. The flowers measure three-quarters of an inch in

diameter, and are borne on stout spikes carrying over a dozen flowers. *W. Bean*.

CÆLOGYNE CRISTATA WITH SEMI-DOUBLE FLOWERS.

Mr. W. Bull kindly sends us a flower of this species with three well-developed lips, one in the ordinary position, the other two occupying the place of the two outer lateral stamens, which are usually suppressed; thus, according to the Darwinian notation the parts of this flower, are arranged as in the margin; A1 being the normal stamen, A2, A3 being the lateral stamens here developed as supplementary lips within the normal lip, L. We understand that the plant produced similar flowers last season.

MR. SOUTHGATE'S ORCHIDS AT SELBORNE, STREATHAM.

A pretty display is made here under Mr. Salter's management, *Dendrobiums*, *Trichosoma*, *Pilumna*, *Cælogyne*, *Cypripedium*, and *Odontoglossum*, forming the bulk of the species in bloom. Of the first-named we observed a fine large piece of *Farmeri heterocarpon*, lighter than the type; noble *nobilius*, *endocharis*, the *Veitchian* hybrid; a beautiful light form of *Findleyanum* and *Ainsworthii roseum*. Of *Cælogynes* in flower there were *Sanderiana*, a fine piece, 3 feet across, growing on a raft near the roof; in this position Mr. Salter says that the plant is a rapid grower, and indeed it so appeared, and full of healthy, strong growths; *C. cristata alba* was showing flower. On specimens of *Pilumna fragrans* numerous spikes of flower were showing, as was also the case with a grand variety of *Phaius tuberculosus*. *P. grandifolius* has been hybridised with *P. tuberculosus*, the result of the operation being a promising-looking seed-pod, which raises great expectations.

We noticed various seedlings Orchids—very minute, but thriving—on the sphagnum of the larger pots. *Cypripedium hirsutum*, an almost perennial flowerer, was nicely in flower; this is still one of the most interesting of the *Cypripids*; sepals purple, the other parts of the flower green, and every part of the plant covered with soft brown hairs. The brightest gem of the collection was undoubtedly *Lælia flammea* ×, a flower with orange throat, petals and sepals, and crimson lip, the flower measuring nearly 3 inches in full diameter. This is another of Messrs. J. Veitch & Son's raising, and apparently *L. harpophylla* has had something to do with its origin. Plants of *Angraecum citratum* in baskets were in full bloom. Numbers of species and varieties of *Odontoglossum*, with some few of the earliest *Masdevallias*, were showing flower. Mr. Southgate's little place is always in good order, and there is never a lack of objects of interest in the various houses.

DENDROBIUM CREPIDATUM.

This is one of the most easily grown and floriferous of *Dendrobes*. The pseudobulbs are from 12 to 15 inches long, and at each node, for the greater part of their length, produce two or three delicately coloured flowers. The sepals and petals are oblong in shape, and overlap each other; the lip is almost orbicular, and the whole flower (measuring an inch across) is of a pure glistening white, with the exception of the lip, which has a yellow patch in the centre. The underside of the column is also streaked with a few bright rosy-purple lines. This species succeeds well in a basket under the usual *Dendrobium* treatment, that is to say, in the growing season, a high temperature and abundance of moisture in the atmosphere and at the root, with a gradual abatement of the conditions as the pseudobulbs finish their growth, finally removing the plants to a cool, airy, and light situation, where they should stay until the latter part of the year, when the flower-buds begin to push, and when a more liberal treatment will again be needed. *W. B.*

DENDROBIUM STRELOCERAS VAR. ROSSIANUM.

The flowers of this variety are pure white, while the form and curiously twisted petals are like those of the typical form. *Lindley*, t. 124.

* This is represented on the Organ Mountains by *Z. Mackayii*, Hook.

WANTED.

SEEDS.—For the Montpellier Botanic Garden, seeds of *Planera aquatica*, *Camboba*, *Reaumuria*, *Limoniastrum*, *Biebersteigia*. Address, Professor PLANCHON, Montpellier.

SAPONARIA CONCAVA ANGLICA.—M. PLANCHON, the Professor of Botany at Montpellier, continues to inquire for this plant. It was described by GERARD in the sixteenth century in Northamptonshire, and was, it is said, cultivated in gardens formerly, but is now lost. It is a variety of the common Soapwort, *Saponaria officinalis*, with alternate leaves and gamopetalous corolla.

MESEMERYANTHEMUM.—Where can I obtain specimens of the following species?—*M. ellipticum*, *truncatum*, *testiculare*, *octophyllum*, *obtusum*, *fissum*, *digitiforme*, *minutum*, *perpusillum*, *obcoellum*, *turbiniforme*, *reniforme*, *naciforme*, *nobile*, *truncatellum*, *fibuliforme*. W. SIBER, *Botanic Garden, Marburg, Hesse, Germany*.

BOOK.—Wanted, the second edition of CAU-RIÈRE's *Traité Général des Conifères*, 1867. Apply to Editor, *Gardeners' Chronicle*.

ASPLENIUMS.

In this extensive genus there are many very elegant species, which for effective decorative purposes are among the most useful of all Ferns. When good plants are once established, they keep in character much longer than many Ferns, and they bear exposure well. It takes longer for plants to attain to a useful size than in the case of some of the *Pteris*, *Adiantums*, &c., and spores do not germinate so readily. However, this is not of much consequence, as many of the most useful sorts are viviparous, and plenty of young stock may be obtained by taking the bulbils, or small plants, from the fronds; but as these tiny plants on the surface of the fronds add additional beauty and attraction, they should only be removed when extra stock is required; as where young plants are much in demand a few old plants should be reserved for the purpose of providing material for propagating from. It is sometimes recommended to peg the fronds down on some suitable soil for the young plants to root into before removing them from the fronds; but this is not necessary if proper care be taken of them after they are removed. The pots, or pans, should be prepared before taking the young plants off. They may be filled three-parts full with any ordinary compost used for Ferns, and surfaced over with a little specially prepared compost, which should consist of peat, loam, and sand in equal parts, with the addition of a little sphagnum moss cut up finely, or dried and rubbed through a sieve. Sufficient space should be left for the pots to be covered with glass after the plants are in; they may then be treated as spores usually are. In the case of those sorts that have to be propagated from spores, it will be a great chance if there is not a crop of some other sort of Ferns come before the *Aspleniums*, and these must be taken out as they appear, otherwise they will prevent the spores of the *Aspleniums*, which do not germinate so quickly, from making a start by overgrowing the surface of the pots.

In the culture of *Aspleniums* (as with most other Ferns), to succeed well it is essential that they should be grown on freely from a young state; for when once allowed to get stunted, through not potting them on as they require it, they never start away so freely afterwards. In potting the plants they should be kept down, leaving only the crown of the caudex free from the soil. New roots are produced from the upper part of the caudex, and if the plants are not potted low enough the new roots appear above the surface, and often perish before they can penetrate the soil; and if this is allowed to go on, the plants gradually become weaker, instead of getting stronger with age.

If the young surface roots are in good condition when the plants are repotted, a great portion of the

old roots that have become matted at the bottoms of the pots may be removed, thus giving more room for new soil, and a better opportunity of keeping the plants confined to reasonable size pots. As far as I am aware, no important additions have been made to the *Aspleniums* recently, either in garden varieties or new species. It is remarkable that in this extensive genus there are so few varieties that have originated under cultivation. A long list of useful sorts might be enumerated, but for decorative purposes the old *A. bulbiferum* is the most popular, and is grown extensively for market work. *A. divaricatum* is another that finds much favour. *A. Fabianum*, somewhat like *bulbiferum*, with longer fronds and of more erect growth, is a desirable sort. *A. laxum pumilum*, though not so extensively grown as the above, is one of the most elegant of the genus. It forms a very handsome plant, and the peculiar glaucous shade of green is very attractive. *A. feniculaceum* is another useful sort, with finely divided fronds of a deep shiny green. *A. flaccidum*, when well developed, is a very effective Fern, and particularly adapted for basket-work, the long drooping fronds having a very graceful appearance. *A. Colensoi* is another useful species, of compact habit; *A. Hookerianum* is synonymous with the above. Of species which require stove treatment, *A. cicutarium* is one of the most elegant; this is not viviparous; *A. formosum* is another very beautiful species, but very tender; *A. Baptistii*, *A. novae-caledoniae*, and *A. viviparum*, are also desirable species. *Pteris*.

PLANT NOTES.

ANTHOLYZA BICOLOR (CUNONIANA).

This interesting bulbous Iridaceous plant is now flowering freely, its tall erect spikes of scarlet and yellow flowers rising well above the Iris-like foliage, which grows about 3 feet high. The flowers are rather singular; the perianth, which is six-cleft, is about equally divided, both in length and colour; the three inner pieces, which are yellowish, although united to the three outer or upper pieces, yet they are only half the length of the upper, which are of a bright scarlet colour, and arching neatly over the three stamens, which extends to just under the point of this hood-like arrangement of the corolla; the anthers are dark brown, and being attached to the filaments by their backs, look rather pretty. The plant is of easy culture—indeed, it is nearly hardy; and as it flowers early in the year without any forcing, it comes in very handy for conservatory decoration. Good free loamy soil suits it best, and 9 or 10-inch pots well filled with bulbs give the best results. The latter part of summer is the proper time to repot, as the bulbs are then at rest. After potting, water sparingly until growth is well advanced. Weak liquid manure, however, is beneficial as the plants approach the flowering stage. When flowering is over, see that the plants do not suffer, as on the proper maturation of the foliage will depend the quality of the flowers for next year's display. At no time should they have more than greenhouse temperature, and always give plenty of air. They are benefited by being placed out-of-doors during summer, laying the pots on their sides. *F. Ross*.

GESNERA ELONGATA.

This is a perennial woody species of *Gesnera*, growing to a height of 5 feet, and forming a well branched shrub, with medium-sized downy foliage and axillary flowers. When well grown the branches develop three to four flowered umbels from almost every leaf axil; each flower being 1 inch long by a quarter of an inch wide, tubular, and flame-red coloured. By a little management it may be had in flower almost all the year round, as is shown by what it does at Kew, where during the whole of last year it might have been seen flowering in the T-range, and a large plant of it is now in flower there. A variety of it with dull red flowers is figured in the *Botanical Magazine*. It is easily propagated from cuttings, and when the plants get scraggy they may be cut back to the old wood, from which new growth will soon push.

STRELITZIA AUGUSTA.

A specimen of this, 25 feet high, is now in flower in the Palm-house at Kew. The stem at the base is naked, ringed, and $4\frac{1}{2}$ inches in diameter, and from a height of about 6 feet from the ground the large sheathing-based leaves are arranged in two regular rows to the top, where the leaves spread out like a fan. The petiole is about 6 feet long, and the blade 4 feet by $1\frac{1}{2}$ foot. The inflorescence is developed at about 14 feet from the ground, and it springs from the angle formed by two of the leaf-sheaths. There are two spikes, one on each side of the stem; the larger one has a stout stalk 2 feet long, bearing two large boat-shaped deep purple bracts, 1 foot long by 3 inches in depth, from which the flowers project, developing in quick succession till a compact cluster is formed. Each flower is 9 inches long, and is composed of three rigid lance-shaped, nearly equal white sepals, and two united halbert-like petals about the same length. These petals enfold the stamens, and the stigma projects beyond them. In the *Botanical Magazine*, t. 4168, the petals are figured and described as being white, but in the plant under notice they are slate-blue. Is it possible that the artist has blundered in making the whole of the flower white, or is the plant now flowering at Kew a blue petaled variety? *W*.

A VISIT TO THE DURBAN BOTANICAL GARDENS.

(SEE SUPPLEMENTARY SHEET.)

LEAVING Maritzburg (2200 feet altitude) by rail we ascend about 1000 feet in the space of 20 miles. Owing to the drought little is to be seen in flower. The most noticeable being the fine golden *Gladiolus aurantiacus*, and the lovely scarlet *Cyrtanthus angustifolius* dotted about on the greensward. Standing above them was *Sparaxis pendula*, with its most graceful drooping snowy blooms, also *Scilla natalensis* in good form, a figure of which appears in the *Botanical Magazine*, t. 5379. The flowers are bright blue, and thickly set on a spike of from 3 to 5 feet in length. *Gazania serrulata* opens its golden eye to the sun in company with *Senecio speciosus*; *Gomphocarpus albens*, like a *Hoaya*, and the beautiful and common snow-white *Cynenium adoese* mingled with purple patches of the lowly *Gardenia scabra*. From hereabouts the view is a splendid one; sheer down from the rails a valley sinks deeper still till the large *Acacia horrida* is reduced to lowly herbs; then rising again, some 15 miles away, the ground swells up into Table Mountain, which in contour is not unlike its famous brother at Cape Town. On its bush-clad sides and flat grassy top I once found some good specimens, including a fine blue-white-headed Selago, a large-flowered deep purple *Osbeckia*, and a pale pink species, also *Alberta magna*, a large shrub of the *Rubiaceae*, with panicles of intense scarlet flowers.

In one spot, close to the railway we passed a few *Tritoma* caulescens with flower-stems quite 7 feet high. Now, rapidly descending, we spin down some 3000 feet in 40 miles, leaving the region of the Apple and Pear, and entering that of the Mango and Banana. The flora gradually changes from that of undulating grassy hills to that of bush-clothed ravines; following these clumps of trees appear, scattered about. Here are *Phoenix reclinata*, *Strelitzia augusta*, and *Spouia guineensis*; finally, when nearing the coast, the train glides into an impenetrable jungle composed of huge trees of various species of *Ficus*, with *Albizia fastigiata*, *Sizygium cordatum*, and many others which were unknown to me, intermixed with flowering shrubs, such as *Oncoba Kraussiana*, *Psychotria capensis*, *Burchellia capensis* a very fine form; *Gardenia globosa*, *Pavetta* species, *Jasminum* species, and on the very verge of the coast, *Carrisia grandiflora*, the Natal Plum. In sandy peat, in open places, I detected the fine golden *Lissoschilus speciosus*, a small yellow *Disa*, a showy pink *Chironia* or *Orphium*, the pretty rose *Rhamphicarpa tubulosa*, a stately white *Cynenium*—*C. tubatum*, a root parasite—and a

very showy golden-yellow Lagarosiphon. In pools I saw *Nymphaea stellata*, a plant not seen near Maritzburg.

Established about twenty-five years ago the Durban Botanic Gardens are situate on a gentle slope 2 miles from the town and sea at an elevation of 100 feet only. In extent they occupy some 50 acres, of which half is under cultivation, and the remainder primeval forest. The soil is a poor brown sand of great depth; of loam, as the word is generally understood, there is none, the splendid vegetation being due to suitable conditions of heat and moisture. There is a good supply of water, since the gardens enjoy a share of the river, which has been diverted to supply the town. White ants are a scourge, and a never-ending fight is carried on against them.

Thanks to the zealous Curator, Mr. J. M. Wood, and his superintendent, Mr. J. Wylie, I was enabled to take a leisurely survey of the collection of plants—an assemblage so rich and interesting that I can only notice the most remarkable. It is very pleasant to wander at will in these deep romantic woods, all the while the hoarse murmur of the Indian Ocean ever sounding, never ceasing—a very marked contrast to the bracing up-country scenery and climate, for Natal has every zone within her boundaries, from the strictly tropical to a point where, 6000 feet up on the slopes of the Drakensberg, snow lies for days together in winter.

The combination of plants most diverse in habit first draws one's attention in these gardens. Here is *Monstera deliciosa* clinging to the trunk of *Acacia Lehkei*, hard by *Petraea volubilis* blooms under the shade of a huge *Juniperus bermudiana*. Further on an aged plant of *Aristolochia ornithocephala* has well-nigh strangled a lofty *Ailantus glandulosa*, whilst a *Bougainvillea* takes undisputed possession of a *Brachychiton*, and *Russelia juncea* is a mass of bloom at the foot of *Bixa orellana*, which last is fruiting.

A neat unheated conservatory contains a good collection of stove foliage plants, some good Orchids and Ferns; amongst the latter was a *Platynerium*, which came, I was told, from the east tropical coast; certainly I have never seen this Fern growing within the colony. Adjoining is a fernery, also unheated; the walls are brick, and the roof is formed of narrow tarred strips of Bamboo fixed an inch apart, which admits a half-light, very suitable for the subjects grown beneath. A few Australian Tree Ferns, a rich collection of exotics, foliage Begonias, Fuchsias, and Orchids, attached to blocks suspended from the roof, all look in good health. In some open frames are a few choice native plants. Leaving the houses, we come to the splendid collection of trees and shrubs dotted about on the lawns, and these constitute the main attraction of the place. The Palms, towering skywards, are very fine; a splendid plant of *Caryota sobalifera* [of which we shall publish an illustration in a future number], in perfect health, contrasting with a dwarf *Hyphæne*, the only Palm native to Natal save *Phoenix reclinata*; *Cocos plumosa*, 20 feet high, is fruiting as well as *C. nucifera*; *Raffia ruffia* is represented by a good specimen, 37 feet high; and *Oreodoxa regia* is nearly as large. Here is a huge clump of the majestic *Ravenala madagascariensis*, seemingly quite at home. All the following are thriving:—The curious *Regelia pinnata*, *Spathodea speciosa*, *Poinciana regia*, *Pinus Benhamiana*, *Castanospermum australe*, in bloom—fine; two or three huge *Laurus camphora*, and a large *Ficus indica*, exhibiting its aerial roots, forming columns.

A few really beautiful Australian trees are *Araucaria Rulei*, *A. Bidwilli*, *A. Cunninghami*, *A. excelsa*, and a *Dammara australis*, 40 feet high. Scattered here and there are seldom seen plants, as *Xanthorhea hastilis*, a fine *Artocarpus integrifolia*, in fruit, a unique *Cupressus prostrata*, 80 feet round; *Dracena Draco*, 10 feet; *Tanghinia venenifera*, the Ordeal tree of Madagascar, in flower; *Aloe dichotoma*, *Dasylirocn acrotichum*, *Pandanus utilis* [see Supplement] fruiting; a few rare Bamboos with yellow and black stems, and some truly imposing *Eucephalartos* with heads 14 feet across. *Franciscea uniflora* blooms

heavily here, as does *Meyenia erecta*. I was attracted by a fine form of *Morea iridioides* with flowers fully 4 inches across. A few beds of bulbs looked very bright—*Ornithogalum thyrsoides*, *Valota purpurea*, and *Sparaxis bulbifera*. Roses can hardly be grown, owing to the love white ants have for their roots; *Crotons*, *Acalyphas*, and *Dracenas* bedded out are well coloured.

Passing down into the nursery I saw large numbers of grafted Oranges, Mandarin and common, seedling Mangos, *Grevillea robusta*, *Thuia compacta*, *Juniperus*, *Eucalypti*, *Pinus insignis*, and some fine varieties of *Hibiscus rosa sinensis*. Here is a plantation of *Manihot Glaziovi*, "Ceara scrap," three years old and 10 feet high. I must mention a rubber plant of *Milletia caffra*—*Umzimbiti* is the native name—from the very hard wood of which the well-known Zulu sticks are made. In a sequestered corner is a collection of Transvaal plants, several of which were new to me, in particular a *Crinum*, with good deep pink flowers. Last, but by no means least, is the very complete herbarium, which I must thank for much valuable information. It has been formed by Mr. Wood, and consists of over 4000 species, carefully named as far as practicable, beautifully mounted and in fine condition. *R. W. Allan, Maritzburg, Natal.*

BEGONIA LUBBERSII.

This is a new Brazilian Begonia, introduced accidentally into the Brussels Botanic Garden with the stem of a Tree Fern. It has an erect stem with peltate, obliquely lanceolate leaves, green, with mottled silvery blotches on the upper surface, claret coloured beneath. The flowers are white. For the rest the illustration (fig. 48) must tell its own tale. The plant was originally described by our lamented friend, Professor Morren, whose loss comes home to us almost daily. The plant is dedicated to M. Lubbers, the talented Curator of the Brussels Botanic Garden, and is well spoken of in the *Revue l'Horticulture Belge* after eight years' observation by Count de Kerchove. The plant is offered in commerce by M. Pynaert of Ghent.

ROOT DROUGHT IN WINTER.

As soon as the great importance of thorough drainage dawned on cultivators not a few of them rushed into the opposite extreme of keeping their plants too dry, especially throughout the winter months. This was only a natural, though doubtless in not a few cases it has proved a most mischievous reaction.

Possibly more plants have suffered and perished through having an impossible dormancy forced upon them through drought than through excessive supplies of water; while as to fruit crops, it is more than probable far more have been dried than flooded off. Besides the flooding off is more or less problematic, while the drying off is absolute matter of demonstration to all cultivators of experience. The *contretemps* of fruit-bud dropping is most common among stove fruits. I firmly believe that it mostly originates in dryness at the roots. No doubt at times it is atmospheric or severe depressions of temperature chill the buds to such a degree as to lower their vitality and loosen their hold of the branchlets, or the frost or winds may be so severe or strong as to virtually destroy or wither up the more vital portion or substance of the blooms on embryo fruit. But fruit-buds are mostly safe from such catastrophes or contingencies under glass. On the other hand, very few fruit blossoms in the open air succumb to drought. The natural rainfall in our climate, unless shed off by artificial means, suffices to prevent such losses. But the case is widely different with internal fruit borders or plants in tubs and pots. On or in these water is given or withheld at will. Often it is withheld too soon, and too long to enforce early and higher maturity of growth in the autumn. When to this is added a long spell of drought throughout the winter, a very arid condition of roots results. When this is carried to excess either in degree or duration, there can hardly be a doubt that

this unnatural dryness becomes one of the most fruitful sources of bud-dropping.

Possibly the buds are virtually starved off for lack of food and moisture. The sap may become too thick and dense to move or flow freely to supply their urgent wants in time. Before such temporary failures can be made good the connection between bud and plant may be irrevocably severed. This is the more likely; as, notwithstanding all the nonsense that has been written on the rest, sleep, and dormancy of plants, it seems certain that nothing analogous to the obvious meaning of these words occurs among them; on the contrary, it seems possible that root-force is abnormally active during the so-called dormant season, and certain that the fluids of plants are never at absolute rest unless inspissated or frozen into solids. The former process may be accelerated if not caused by the forcible method of water. Against such fearful risks of excessive drought there are no corresponding advantages to the plants. It is even doubtful how far drought at the root hastens or lengthens the maturity of the wood and buds; that it favours the growth of fungus among and on the roots is admitted by every experienced cultivator. It also favours the growth of warts and canker, as well as hardens the bark and lessens the size of the roots. All this either fetters healthy function or favours disease, therefore excessive root-drought ought to be avoided. So far as known, moisture at the roots of our fruit trees is good, not evil—it neither injures nor kills. On the contrary, it keeps the fruit-buds fully supplied with food and water, and so strengthens their hold on the plant when it passes through the critical setting period in safety. For one bud flooded off probably a hundred are starved off. Our natural water supply is not excessive. It is not water at the roots, but stagnant water that is to be warred against; and the art of thorough draining consists in setting and keeping the water in motion among the roots, not in shedding it off the surface of the land, or in leading it by the shortest cut, away from its natural ministry of aid for the roots, into the nearest ditch or river. *D. T. Fish.*

ROSES.

SOME NEGLECTED ROSES.

TEAS AND NOISSETTES.—There is no question as to the value of this section of Roses, and of its popularity—a popularity which has greatly increased of late years; it is popular alike with the exhibitor and the bouquetist; one has but to visit Covent Garden to see how large a portion of the Roses there seen are of this class, and, indeed, one may say that two of the number—the one a Tea and the other a Noisette—*Niphetos* and *Maréchal Niel*, "hold the fort." It has been found out that Tea Roses are neither so tender nor so difficult to manage as it used to be supposed. The increase in the growth is borne witness to by the fact that the National Rose Society has inserted in their schedule a Tea and Noisette division, and that is largely and admirably filled; but it is this very popularity as an exhibition flower

that is likely to put into the background some Roses which do not fulfil the exhibitor's exacting demands, but which, nevertheless, are admirable for the garden. Some are considered, and are, too loose—they have too few petals, and consequently when placed in the heated tent or room soon show the "eye," and fatally injure the box; others, again, are too small, but are exquisitely beautiful. It is mainly, however, I think, amongst the climbing Teas and Noisettes that these now somewhat neglected Roses are to be found; the Gloire de Dijon race, the type itself, and those which have sprung from it, seem to have elbowed out by their great vigour and large flowers many which I am sure are equally deserving of a place either for a wall

but withal, its rich apricot colour is so fresh that I would advise its retention—in bud it is especially beautiful.

Bougère.—An old Rose, as it was raised by Bougère in 1832, and was formerly universally grown and I think deserved its position. It is a bold striking Rose for its class, its colour a bronzed-pink, the petals very thick, and the plant remarkably hardy. Perhaps some over-fastidious exhibitors would say "Not suited for us." That may be so, but there is no Tea Rose I think more worthy of a place than this once popular, but now almost forgotten flower.

Narcisse, N.—I have a vivid recollection of a fine plant of this in the front of a house at Maidstone. It certainly did not there deserve the character

It is a full Rose, yellow, with a deeper centre, of good form and substance.

Marcelin Rhoda.—A very pretty Rose, hardly up to the exhibitor's standard, but its peculiar shade of yellowish-white makes it a desirable variety.

Rève d'Or.—I must claim the honour of being the foster-father of this Rose; it reached me with a few others in the terrible time of the Franco-German War. It was six weeks on its way, and I naturally supposed it was dead; it, however, survived, was planted against my house, and has often been described by me and seen by some of my friends; it is a most rampant grower, almost evergreen, and most floriferous. When my plant was in its glory, before the terrible frosts of 1880 and 1881 punished it so, it was a sight to behold. Taking a certain space of it and multiplying the number of blooms with the space occupied by the entire plant, I believe there were not less than 3000 blooms upon it. Its colour is a fawn-yellow, somewhat like Madame Falcot, and when it was thus in full bloom and the sun shining on it, it was a glorious sight. I had feared that it was all gone, but it has again shot up from the old stem, and is now rapidly pushing its way to occupy its former space. I should say the aspect in which it is planted is due east, and probably had it been in a more favourable position it would not have suffered so much as it did.

Claire Carnot, N.—This is a Rose I confess to having known but little of until I saw it in Mr. George Bunyard's nursery at Maidstone. It is not unlike Celine Forestier, but is a better and more fragrant Rose.

Countess of Limerick.—Of this Rose, too, I knew nothing until I saw it in Messrs. Cooling's stand of Roses at Bath last September, and afterwards at their nursery. It is a perfectly shaped Rose, white, slightly suffused with pink, and I think is worth looking after. I do not know its origin nor can I find it in any catalogue.

Laurette.—Another but little known Rose. We are in the habit of seeing it exhibited in East Kent by Captain Knight and Mr. Wakley, but I had seen it nowhere else until I saw it with Messrs. Cooling, whose foreman spoke very highly of it. It is a very pretty yellowish-white Rose, with the edges tinged with pink; in fact, one might describe it as a refined Homère.

Celine Forestier, N.—There is, I think, some fear of this very pretty Rose being pushed on one side, but as a climbing or pillar Rose it well deserves a place. It is small, and the eye is apt to come queer, but with all that it is so free and so bright that it ought to be grown. How well I remember my old friend John Standish's delight when he first saw it with Trouillard, Le Roy's foreman, at Angers, and how equally (perhaps more so) delighted Trouillard was when he accepted the liberal offer made to him for its purchase; in gratitude for which he wanted us to take some tea made with cold water! All who recollect John Standish will readily imagine in what light he regarded the compliment paid him! I shall always like the Rose for the pleasant associations connected with it, but independently of that it ought not to be a neglected Rose.

As I have said with regard to hybrid perpetuals so I would say with regard to Teas and Noisettes. There are perhaps others that will suggest themselves to Rose growers, but I have been anxious not to overload my list, but merely to suggest the names of some flowers which I thought have been undeservedly neglected and which merit better treatment.

With regard to the remarks of your correspondent, "Rosa," I would venture to differ on a few points. Let me take the *Roses seriatim*:—

Auguste Mie.—I hardly think that, with the many beautiful glossy pink Roses, we need retain this, which was always somewhat capricious as to opening.

Jules Margottin.—I do not think "dear old Jules" is as yet to be considered a neglected one; it does not so often figure in the exhibition-stand, and is by the National Rose Society relegated to the garden Roses, but I think it is to be met with in most

FIG. 48.—*BEGONIA LUEBERSII*. (SEE P. 300.)

or as pillar Roses. Amongst the Teas which are in danger of being altogether shut out from the garden are the following:—

Homère.—This is a very vigorous and at times a very pretty Rose, although uncertain, as it is apt to show a hard eye, but when caught good is really very pretty. It has a curiously crumpled edge, and the slight pink edging, which is characteristic of it, adds to its beauty, while its great vigour of constitution justifies its claim to being considered a good garden Rose; it is sufficiently good and strong in growth to make it a pillar Rose.

Madame Falcot.—The colour of this Rose ought to make its retention in our gardens a necessity, but it unfortunately is too thin, and woe to the exhibitor who trusts to it for his stand, it is sure to open itself, and shew its eye, before the day is half over; in the same way it very soon opens too fully in the garden,

given to it of a moderate grower, and the owner of it was often able to cut flowers suitable for the exhibition stand, but its pretty bright yellow flowers are under any circumstances very attractive.

Lamarque, N.—This Rose, raised so far back as 1830, has very inadvertently fallen into disfavour, yet its white flowers, with their delicate tinge of sulphur in the centre, of good size and sufficiently full, ought to ensure it a place as a climbing Rose, either on a wall or as a pillar Rose.

Triomphe de Rennes, N.—This flower was, and I think deservedly so, a great favourite with my old friend, Mr. Radclyffe, and some may call to remembrance the fine plants he had of it in front of his cottage at Okeford Fitzpaine. It is supposed to be a seedling from Lamarque, but is not so much of a climbing Rose. The blooms are produced, as in most Noisettes, in clusters, and are often very large.

gardens, and if it is in danger of being shut out, your correspondent's word may help its retention.

John Hopper.—Here I am quite persuaded your correspondent is in error; it is still retained in the National Rose Society's catalogue of exhibition Roses, and is much praised therein. It is an early-flowering Rose, and I do not think is often absent from stands at the early shows; its one fault is that its colour soon flies. I have a peculiarly fatherly interest in this Rose, for it was at my instance that Mr. Ward pushed it, after having been passed by the Royal Horticultural Society when first shown.

Duchess of Sutherland.—I have also a sentimental regard for this Rose, and hope it may be retained, although it is hardly a perpetual Rose. And so with *La Reine*, which is so bad a flower to open, when caught very good, but seldom giving satisfaction.

Centifolia rosea ought to be retained. The same may be said of Fisher Holmes, but I do not think this is in danger of being cashiered.

Duchesse de Caylus, a very beautiful Rose, but a difficult one to keep; delicate in habit, and although still retained on the list of exhibition Roses, of no value as a garden Rose, owing to these defects.

Madame Knorr and Madame Laffay are, I think, doubtful, for I think we have others which may well be grown instead of them. *Wild Rose*.

It is to be hoped that the remarks of "Rosa," in last week's *Gardeners' Chronicle*, p. 236, may be the means of inducing rosarians to notice some of the neglected Roses mentioned. May I be allowed to state that at the first Grand National Rose Show ever held, and which took place at St. James' Hall, London, on July 1, 1858, I was the winner of the 1st prize for amateurs—a very handsome silver cup, value 10 guineas (schedules were different then)—for twenty-four single blooms. The names of the Roses in my stand would now, as "Rosa" observes, "only beget a bewildered stare," and the plants are now probably only to be found in old-fashioned gardens like mine; yet many of the Roses are, even at present, not surpassed by new-comers for beauty and fragrance. Here are their names:—

H.P.—Auguste Mie, Baronne Prevost, Duchess of Sutherland, Général Jacqueminot, Jules Margottin, La Reine, Madame Laffay, Charles Lefebvre, Lord Raglan, and William Jesse.

Bourbon.—Souvenir de la Malmaison.

Gallica.—Ohl, and Boule de Nantenil.

Hybrid China.—Coupe d'Hebe, Paul Ricaut, Brenns, and Chénéolé.

Tea.—Adam, Souvenir d'un Ami, Gloire de Dijon, Viscountesse des Cazes, and Niphotos.

Noisette.—Lamarsque, and Cloth of Gold. *J. Dorslase Maunsell.*

CULTURAL MEMORANDA.

THYRSACANTHUS RUTILANS.

This pretty stove plant is of erect habit, but has numerous long panicles of drooping bright crimson tubular flowers, which appear during the winter months. Cuttings put in now in a mixture of loam and leaf-soil—two parts of the former to one of the latter, with enough sand added to make it porous—and placed in a warm propagating pit or hotbed, will soon take root, after which they should be potted singly in 60's in the same kind of compost, but adding a little half-decomposed cow-dung; afterwards return them to their old quarters, or to some shady place in the warm house, for a few days, until they get established, when they can be removed to a shelf near the glass, as they have a tendency to become tall when far from it. This item in growing *Thyrsacanthus* should not be omitted. Shift on into 5-inch pots when it is required, and this sized pot will be quite large enough for them to flower in. When they have filled the pot with roots weak liquid manure with a little soot added may be given them twice a-week. The plants are often infested

with brown scale, which can best be removed with a sponge and clear tepid water, being careful not to injure the foliage, as this is one of the attractions of the plant. *C. Ensoll.*

HARROTHAMNUS ELEGANS.

Cuttings of the young growths taken off now and inserted in pots filled with light sandy mould, watered, and put into heat, will soon make roots; they should then be potted singly into 3-inch pots, in a mixture of four parts fibry loam and one of sweet leaf-mould and sand, keeping the plants in a warm frame until established, after which they will do very well in the greenhouse or hot-water pit near to the glass. Before the roots become matted the plants should be shifted into larger pots until they are finally placed in their flowering pots, when frequent supplies of weak liquid manure should be given at the roots, with occasional surface dressings of Beeson's manure before watering, when the plants approach the flower period. *H. W. Ward.*

NUCOTIANA AFFINIS.

This sweet-scented greenhouse annual should be grown by every one having a hotbed and a greenhouse at command in which to raise and grow on the plants. A plant or two when in flower will fill a large-sized house with fragrance late in the afternoon and throughout the night, and the fragrance emitted from a plant set here and there in a bog bed, or scrubby border, is very refreshing to breathe at eventide during the summer and autumn. Seed sown at once in light sandy mould, covered lightly and put in heat, will soon come up. When they are up, keep the pan near the glass to prevent drawing, and when large enough prick out, at 2 inches apart, in shallow pans, filled with a mixture of three parts light sifted loam and one of leaf-mould, with a sprinkling of sand; water, and put back in heat and shade from sun until the roots have taken to the soil, when it should be discontinued. As soon as the leaves of the plants touch they should be potted off singly into small pots, afterwards shifting them into 4½-inch, and at last into 6-inch (the flowering) pots as the roots require more room. Syringe the plants overhead morning and afternoon while in heat, to prevent the attacks of red-spider. Plants intended for transplanting out-of-doors should be hardened off when well established at the same time as the ordinary bedding plants are. A pinch of seed should be sown at the end of July to raise plants for flowering during the winter and spring months.

ACHIMENES.

The present is a good time to start the tubers into growth. Place them about 1 inch apart in well crooked seed-pans filled to within 2 inches of the top with light sandy mould, and cover them to a depth of half an inch, placing the pans in heat and watering slightly. In a fortnight the young plants will appear, and when they are 2 inches high they may be transplanted 2 inches apart into pots ranging in size from 4½–8 inches in diameter; employing a compost consisting of three parts light loam and one of leaf-mould and pulverised cow-dung, with some sharp sand added. Put the plants after they are potted in a position near to the glass in any structure having a night temperature of about 65°, and then give sufficient tepid water to settle the soil about the roots. When the plants are 5 inches high pinch the points out to cause the growth of the laterals. Attend to the plants in the way of giving water at the roots as required and syringing the plants overhead morning and afternoon on bright days until they come into flower, when it must be discontinued and the plants gradually subjected to an airier atmosphere. Support the plants with neat sticks where necessary. The plants in 4½-inch pots look best without sticks: the flowering shoots hanging over the edge of the staging, &c., being very effective. The following are among the most useful varieties grown, namely:—*Ambroise Verschaffelt*, fine white with dark stary centre;

Advance, flowers reddish-purple, light spotted eye, shaded towards the edge; *Belmontensis*, large, violet-purple colour, with light centre; *Longiflora*, large blue; *Leopard*, bright magenta-rose, with a well spotted throat; *Patens*, blue; *Rose Queen*, rose-lake in colour, shading to deep purple, with an orange throat; *Firefly*, very large deeply fringed rich magenta, yellow eye, dotted with maroon. *H. W. Ward.*

THE APIARY.

GENERAL HINTS.

Snow on the hills, snow in the valleys, no posts in or out, and one or two articles on the apiary lost, such has been the order of the day lately. Snow never does bees any good. In the first place it must never be allowed to accumulate on the hives, but must be brushed off at once, or it will be sure to penetrate somewhere. Snow will always find the weak spot, or make one. Then, very often while snow lies on the ground, the sun comes out brilliantly, and the intense light caused by the snow and the sun combined, entices the bees out of their hives, only to fall in the snow. Once there, they rise no more. Moral: shade the entrances with boards. Though we like to keep entrances open to their full width, so as to keep the hive dry, yet, rather than lose our bees, we would nearly close the entrance, as in robbing time, and shade the remaining small aperture. Only this week we noticed a case where this was neglected, and the consequence was heaps of bees in the snow. This not only decimates the hive, but may cause the death of the remainder through loss of heat.

Food.—I do not on any account recommend the use of syrup yet, and no manipulation of the hives ought to be allowed. If you fancy food is required, gently lift the quilt and see if there is much sealed honey in the neighbourhood of the brood nest. If there is a scarcity lose no time but supply candy at once. It is not worth while for the small bee-keeper to make candy if his time is of much value. Snowdrops are fully developed in this locality, but weather has prevented them being much used by bees as yet. However, on the disappearance of the snow, the early blossoms of the fruit trees will appear, and these with the opening Crocuses, will, we hope, give our bees a start. Though February was so cold, there have been times during the winter when the bees have had a cleansing flight. *Walter Chitty, Pewsey, Wilts.*

PLANTS AND THEIR CULTURE.

SHADINGS.—There are numbers of plants grown under shading, many of which might be grown equally well without it, provided air, water, and fire-heat be regulated to suit the altered conditions of cultivation; for without shading being used more of air and water, but less of fire-heat, would be required. These conditions are particularly applicable to large plants in roomy houses—such as winter gardens, Palm-stoves, and any houses containing a fairly large volume of air. Plants grown for their flowers under this kind of treatment flower much more freely; and foliage plants will have more brilliant leaf markings, and more substance in the leaves, which become better matured, and better fitted to withstand the rough treatment they are frequently subjected to, and the plants will endure a low temperature for a much longer period without injury than shaded plants. But some kind of shading is indispensable to success in certain cases, as with plants in small pots, which stand on shelves or are otherwise exposed to the rays of the sun. Then there are plants with soft thin leaves, which, having but a small amount of reserve material, depend on constant supplies of water to maintain growth.

Although shading plants is beneficial in some cases, yet we find that shading reduces the activity of life in a plant—that is, a lesser quantity of food is taken up in a given time than would be the case were no shading used. In making use of shading what should be aimed at is, not so much to shut out the sun's rays as simply to break and divide them; and for this purpose I do not know of any-

thing better than those loosely woven fabrics that are sold under a variety of names; but, whatever the name, the space between the threads should be about one-eighth to one-sixteenth of an inch. This will permit the sun's rays to penetrate the material, yet, owing to the movement of the shadow cast by the thread, they will not remain sufficiently long in one place to do injury to the most tender plants. The shading should never be fixed, but should be attached to the ridge of the house outside, and a wooden roller provided by which it can be wound up when not required. It is an improvement if it can be so arranged that a clear space can be kept between the shading and the glass. This may be done by putting up a temporary framework. Where it is necessary to use some wash as a fixed shading, never use more of it than is actually required, and avoid all coloured shadings, more or less debilitating effects following their use. Perhaps one of the best washes is that made from size and flour. This is put on the glass evenly with a white-wash brush, and stippled over with a brush before it gets dry.

Nepenthes.—These are found to do best when hung up in a warm moist atmosphere and avoiding the high temperatures sometimes recommended. A temperature of about 75° and a maximum amount of light and air whilst making growth, is well suited; during the winter months they will withstand a temperature of 20° less. Some plants flower profusely suspended in baskets in the aquatic-house in a temperature during winter of about 50°, and during the summer of a tropical one, no shading being employed, but exposed fully to the rays of the sun, which no doubt consolidate their tissues. That *Nepenthes* bear without injury both extremes of temperature is a fact which raisers of new varieties might note with advantage. Old plants, which are getting too large or leggy, may either be cut down, or the tops lowered over the sides of the baskets. This lowering will induce them to push out new growths from the base. If the tops are cut off they may be utilised for cuttings, which root without difficulty. Cut them up into lengths of from two to three joints, and insert them in a propagating frame with cocoa-nut fibre refuse. But as the young roots are very brittle, and break readily when potted, I prefer to put them in singly, in small thumbs, using light fibrous peat, placing a pinch of sharp sand at the base of each cutting, and tying the leaves up to a stick so as to prevent the cuttings from moving. The last is important, as I have seen many failures through the cuttings not being properly held firmly in the soil. The soil best suited for *Nepenthes* to grow in is fibre of pure peat, a few pieces of charcoal, and fresh sphagnum moss. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

CHRYSANTHEMUMS.—Plants intended to flower in the open air may now be planted out, those of the previous year's growth in pots being well adapted for this purpose. Incurved and pompons are the best varieties, Japanese being rather too tender, except in the most favoured localities, and against warm walls—a position which suits all the varieties. Turn out the old stools and reduce the balls to one-third of their bulk, and plant firmly in good turfy loam and leaf-mould, and see that they do not suffer during dry weather from want of water. Plants intended for lifting in the autumn and flowering indoors should be shaken out and repotted firmly in the same sized pots, mixing with the compost used a moderate quantity of bone-meal, and plunge to the rims in an open sunny border.

Seed Sowing.—The following may be sown in well drained pans, and placed in a warm house or hotbed, viz.:—*Perilla*, *Chilian Beet*, *Amaranthus*, variegated *Maize*, *Nicotiana*, *Salvia argentea*, and *Cineraria maritima*. If hotbeds are made use of, attend well to ventilation as soon as the seeds have germinated, and cover up at night. Much caution in watering will be necessary in the early stages of growth. The undermentioned seeds may be sown in frames filled to three parts with warm manure, which should be well trodden down, and a bed of finely sifted loam, leaf-mould, and sand, 4 inches thick:—*Ten-week Stocks*, *Asters*, *Zinnias*, *Phlox Drummondii*, *Helichrysums*, *Salpiglossis*, *Scabious*, and *Pyrethrum Golden Feather*; the last-named may also be sown on warm borders outside in southern counties, and if a frame can be placed over the seed bed for a month, all the better.

Sub-tropical Bedding Plants.—From seed sown in January young plants of *Acacia lophantha*, *Solanums*, &c., may now be potted off singly into thumb-pots in a soil similar but somewhat rougher than that in which they were sown. Let them remain in a high temperature, be well syringed overhead in sunny weather, and shifted into larger pots before becoming pot-bound. Pot off young plants from subsequent sowings as soon as they are large enough. These subjects require liberal treatment in the early stages, the object being to obtain plants of large size by the time they are planted out, as their season of growth outside is usually of short duration. *J. Horsfield, Heytesbury.*

THE ORCHID HOUSES.

CYMBIDIUMS.

NEARLY all the *Cymbidiums* possess a strong constitution, and will endure a wide variation of treatment, as is proved by their growing in a cool house for some years before showing signs of declining in health. I have before now by way of experiment, placed some plants of *C. Mastersii* in the East Indian house, and others with the cool *Odontoglossums*; both remained in health, the former increasing more than twice as fast as but not flowering so freely as those in the cool house. I find the intermediate or *Cattleya* house the most suitable place for the plants when growing and flowering. *C. eburnea* grows and flowers freely in the warmest house. A few years back it was thought by some, that to grow *Cymbidiums* properly the compost should consist chiefly of loam, but for such species as *C. Parishii*, *C. Lowianum*, *C. giganteum*, *C. Hookerianum*, *C. Mastersii*, *C. purpureum*, and *C. aloifolium* I prefer equal parts of lumps of peat and loam, to which may be added a small quantity of dry cow manure broken small, some half decayed leaves of Oak, and a good sprinkling of coarse sand to keep the compost open. *C. eburnea* I have found to grow best in fibrous peat with the other ingredients named. The section which possesses thin leaves requires the leaves to be sponged occasionally to keep in check red-spider, it being never safe to syringe these plants much, the water causing the centre of the growths to rot. *C. Woolford, Downside.*

THE HARDY FRUIT GARDEN.

APRICOT TREES.—On frosty mornings the blinds should be left down till the thermometer rises above freezing point, covering the trees again in the afternoon about 6 o'clock, or before that time should the air be frosty. It will not be advisable to leave the trees exposed at night after this date in warm districts, but in colder localities they may be exposed at night for some time longer, unless very sharp frosts threaten. In the west there has been but little sunshine for the last three weeks, and this together with the low temperature have retarded the opening of the bloom-buds, but a few warm days will soon cause them to expand.

Grafting.—All trees which it is intended to graft may now be headed back, and when clay is used for the operation it should be prepared, taking care to mix chaff enough with it to prevent undue cracking. Where there is much grafting to be done, some form of grafting-wax will be found a very suitable substance to be used instead of clay. Now is the time for anyone possessing healthy Pear trees, but whose fruit is almost worthless, to test the experiment of double grafting the trees; but the selection of kinds to use for the purpose will depend in a great measure on the stocks, and the sorts already worked on them. I have practised double grafting with great success here, and I will touch more fully on the subject next week. *A. Ward, Stoke Edith Gardens, Hereford.*

THE ORCHARD HOUSE.

IN our earliest house the fruit is now well set, although the weather has been most unfavourable. I attribute such success to keeping the atmospheric conditions right. The house is of course heated with hot-water pipes, and with these the night temperature was kept up to 50° and 55°, with a small amount of air on back and front both night and day.

The atmosphere itself was comparatively dry. We had a rabbit's tail tied to the end of a stick, and drew daily the fur over the blossoms. Peaches and Nectarines set, perhaps, more readily than any other stone fruit. Plums are next to them, and, as a rule, they set very well; but when mixed with Peaches and Nectarines I have found, in cases when there was a bad set, that the Plums are generally the worst. Apricots are worse than Plums, which will set their fruit when trees of the Peach, Moorpark, and Apricot have failed to do so. Apricots in an unheated orchard-house should usually be in bloom about the middle of March, Peaches and Nectarines about the end of March or early in April. In the case of unheated houses much depends upon the weather. In some districts the sun may scarcely be seen for ten days or a fortnight; with this, and continued cold weather, blossoms can scarcely be expected to set well. Pears and Cherries are the most shy setters; both of these, when grown under glass, require a dry atmosphere kept in motion by open ventilators even at night, and this is not possible during sharp frosts unless there is some sort of heating apparatus. Another way of setting the fruit is by tapping the tree two or three times, so as to scatter the pollen. In the case of pot trees which have been surface-dressed to the depth of 2 or 3 inches the inexperienced cultivator may be deceived at this season by the state of moisture in the fresh compost; that may be wet enough, but the portion underneath, which is full of active roots, may be too dry; and if this be the case the buds will certainly drop off. Any one having such trees would do well to carefully examine their condition. The blossoms are now expanding in the late house, and although the weather is cold we have plenty of sunshine by day, and a little heat in the hot-water pipes is sufficient to keep the temperature up to 40° at night with a little air on. A dry atmosphere is essential for the setting of the blossoms, especially for Pears, Cherries, and Apricots. If there is room in the house for one only of the three last-named fruits, Pears ought to have the preference. These can be grown to large size, and of excellent quality, from pot trees. Amongst late varieties the best for pot-culture is *Josephine de Malines*. I have also had *Beurré Rance* of good quality, and also *Chamontel*. It is a decided advantage, too, to have *Williams' Bon Chrétien* and *Louise Bonne* of Jersey ripe two or three weeks before they can be obtained from the open borders. The trees do not require much syringing, and ought to be in a part of the house by themselves. *J. Douglas, Ilford.*

THE KITCHEN GARDEN.

SEEDLING PLANTS.—The early sown *Celery* will now be ready for pricking out into boxes or pans, and afterwards placed in a frame with a moderate bottom-heat, and near the glass. Carrots and Turnips in frames should be thinned out as soon as possible, leaving the former 3 inches and the latter 6 inches apart. Peas and Beans that were sown in pots and since have been grown in cold pits or houses, should be planted out after being gradually hardened off. Peas succeed best if planted in shallow trenches and the sticks put to them at once, sticking some branches of evergreens by the sides of the rows for a few days.

Potatoes.—A few sets of early varieties should be planted in a sheltered position, such as the foot of a south wall or by the sides of forcing houses or any similar position where they will get a little protection; a large amount of soil is not necessary for them, and a nice crop that will be of great service may be grown in a border 18 inches in width if the soil be light and rich. In such borders the plants can easily be protected from frost after they are up by placing a few branches of evergreens in front of them whenever frost threatens. If no such position be available it will be advisable to plant a few in cold frames, when they will succeed those grown on hotbeds. In the warmer parts of the kingdom not quite so much caution will be necessary.

Seeds to Sow Outside.—Early Carrots, Milan Turnip, Spinach, Leeks, Brussels Sprouts, Cos Lettuce, Alexandria or Paris White; Cabbage Lettuce, Paris Market; Cauliflowers, Early London, Asiatic, Eclipse, Autumn Giant; Peas, and Parsnips. With the exception of the two last these should all be sown on south borders or similar warm positions, and Early Beet, Marjoram, and Basil should be sown in heat for planting out afterwards. *W. H. Divers, Ketton Hall, Stamford.*

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY,	MAR. 12—	Chambre Syndicale of Ghent.
TUESDAY,	MAR. 13—	{ Royal Horticultural Society: Science, Fruit, and Floral Committees.
THURSDAY,	MAR. 15—	Linnean Society.

SALES.

TUESDAY,	MAR. 13—	{ Imported and Established Orchids, at Protheroe & Morris' Rooms, Roses, Shrubs, and Other Plants, at the City Auction Rooms, by Protheroe & Morris.
WEDNESDAY,	MAR. 14—	{ Roses, Fruit Trees, Shrubs, Border Plants, Bulbs, &c., at Stevens' Rooms. Lilium auratum, Roses, and other Plants, at Protheroe and Morris' Rooms. Nursery Stock and Greenhouse Plants from sample, at Protheroe & Morris' Rooms.
THURSDAY,	MAR. 15—	{ Orchids in Flower and Bud, at Stevens' Rooms. 10,000 Lilium auratum, &c., from Japan, at Stevens' Rooms.
FRIDAY,	MAR. 16—	{ Established Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	MAR. 17—	{ Bulbs, Roses and other Plants, at Protheroe & Morris' Rooms.

The Food of the People, and Railway Rates.

ONE of the most important features to producers and buyers touched upon by Mr. D. TALLEMAN in his paper on "Available Food for the People" (page 234) had reference to the "Railway Difficulty, and how to Deal with it." What is required is an economical system of carriage and parcel-delivery by railway, and this all parties should unite in seeing embodied in the forthcoming Railway Bill. Mr. TALLEMAN thus traced the growth of the monopoly held by the railway companies:—"It must be borne in mind that upon the formation of railways it was understood that they would construct their lines, and that the public would provide trucks and traffic, and pay a toll for the use of the engines and rails. This would have tended to a healthy competition, and led to the adoption of a reasonable tariff of rates by those engaged in the trade. It did bring into existence a number of carriers, who collected and delivered the traffic, paying station to station rates; but in the course of time the railways bought out the carriers and also the bulk of the lands; and having thus secured the control of the traffic, claim the right to charge, not only the maximum rates allowed them by their

various Acts, but also for every service incidental to the collecting, proper retention, weighing, and delivery of goods, and, in addition, a terminal charge for the use of their stations where the goods arrived." The various charges, which are new, and in some instances illegally made, virtually enable the companies to levy whatever they please upon the goods placed in their hands—which they invariably do, basing their rates, not upon the services rendered, the amount of the traffic, and the distance travelled, but on the class of goods, and what, in their opinion, the traffic is able to pay. In their classification food products are invariably in the fifth or highest class; but exceptions are made to the rule in the case where the railway has to enter into competition with water-carriage, and in connection with goods from abroad. These are principally collected by carriers whose own agents, to a large extent, deliver their own goods, pay a through or truck rate on the Continent, and who can use whatever line they please on this side. It will thus be seen that the railway companies have virtually assumed the right, at their will and pleasure to tax the food of the people to any extent they feel disposed.

Seeing that the metropolis is placed in an anomalous position by the eight railway companies, and also by the Corporation, "who conduct the markets so as to render them monopolies in the hands of a few favoured traders, to continue levying charges in the form of excessive rates, commissions on middlemen's profits, &c.," Mr. TALLEMAN urges that its people should insist upon and not rest satisfied until they have acquired free and open markets, where farmers, if they wish, can legitimately enter with their produce, and not be charged a higher rate of carriage than would leave a fairly remunerative rate on the cost of its conveyance. These high rates for transit operate to render it unproductive, to raise many articles in those portions of the country that are any distance from the centres of population, and virtually prevents a large extent of land being brought into cultivation." "An examination of the Agricultural Returns disclose many facts that are painful to contemplate. Market gardens and orchards, the yields from which are beneficial to the people and should be profitable to the farmers, can only be found in the counties immediately adjacent to the metropolis, and even the fruit-growers of Kent find that the railway charges for bringing their produce to London frequently absorbs the bulk of what is received for it." Mr. TALLEMAN'S remedy for the existing state of things is to insist upon railways conducting their operations upon the basis upon which they were established, and to compel them to haul produce at a reasonable truck-rate, and to take up such a position as would not only compel them to do so, but prevent them again, by means of their combination, acquiring a position of undue influence. To attain this end steps should be at once taken to prevent an extension of the present position by dealing with the future, and Parliament should pass a Standing Order that no Railway Act of any kind or character should be passed for the construction of any new lines or the extension of any existing lines unless a clause providing for a truck and train rate be embodied in it. Further, in order to render nugatory the efforts of the railway combination, and result in the establishment of reasonable rates for home-grown produce, it is advisable to pass such a general Act of Parliament as would enable local authorities to provide spaces and to make connections with railways in their several districts, so that trucks

with produce can be run direct into them, and their contents disposed of by the owners without incurring the cost of loading or unloading, and thus defeat the right to charge for terminals, unnecessary services, &c. Also, to enable local authorities to make auxiliary lines or tramways to be in connection with the railways, over which they should have running powers. The effect of these auxiliary lines and open spaces, which should be confined solely to home-grown produce, would be that the farmer in a district could so arrange that railway trucks could be loaded on or close to his farms, and be run right into what would serve as a market, with the least expenditure of labour and at a nominal cost.

In the discussion which followed Mr. W. H. LE FEVRE, C.E., said that the island of Jersey paid the whole of its debt by the proceeds from the trade done in fruit and early Potatoes exported therefrom. He said that he can get vegetables to his house in London from Jersey at a cheaper rate than from Cornwall, and he attributed that result to the fact that there was a sharp competition for the traffic between the Great Western and South-Western Railways, to the benefit of the producer and consumer alike. In fact, he had proved that goods could be brought to London from the Channel Islands at a cheaper rate than from districts distant only 20 miles from London. Mr. E. CLEMENTS, of the Railway and Canal Traders Association, Eastcheap Buildings, E.C., dwelt upon the importance of cheap transit, and especially in reference to the food of the people. It is a public question of the first moment, having such a direct interest to all classes of consumers. The difference in a railway rate frequently means the whole profit obtained. He gave a few remarkable instances of differences in rates of transit; thus, assuming that an acre of land will produce $4\frac{1}{2}$ quarters, or 1 ton of Wheat, the railway rate from the East Coast to Birmingham is 22s. 4d. per ton, but from Cardiff to Birmingham only 8s. 4d. per ton—the difference, 14s. per acre. In the case of Potatoes, supposing 1 acre produces 7 tons, the rates of carriage are the same as in the case of Wheat—the difference, 14s. per ton, or £4 18s. per acre, or, on 100 acres, £490. These facts are furnished in the evidence of Mr. FLINN, given before the Royal Commission on Trade. Grain from foreign parts is conveyed from West Hartlepool to Newark at 9s. 2d. per ton, English grain at 15s. 10d., or 72½ per cent. in favour of foreign stuff; the excess in this case, 6s. 9d. per acre. Cattle are conveyed from Newcastle to Leeds at 48s. 6d. English, and at 31s. foreign; to Wakefield at 51s. 6d. English, and 63s. foreign; to Manchester, 31s. foreign, 44s. 3d. English. But here is something more remarkable still. Potatoes and fruit are conveyed from Selling, Kent, to London, a little over 50 miles, at 23s. 4d. English; from France, *via* Selling, through rate, 20s. foreign. Foreign cheese is conveyed from Liverpool to London at 25s.; Cheshire cheese, picked up *en route*, at 42s. 6d.!

In the face of these facts, a thorough revision of the rates of railway transit as between English and foreign goods is absolutely necessary, but we fear it can only be done by sending to Parliament men thoroughly alive to its necessity, and by endeavouring to act upon public opinion in the way Mr. TALLEMAN is doing. We need hardly add, that this is one of the many questions which the Royal Horticultural Society has entirely neglected in the past, but one in which it should have a voice in future, and which should be taken in hand by a Commercial Committee, formed for the purpose of dealing with affairs of public interest.

THE PHOTO SPENCER & CO. 22, MARTIN LANE, CANON ST. LONDON, E.C.

SCREW PINE IN PUBLIC GARDENS, DURBAN, NATAL.

ROYAL HORTICULTURAL SOCIETY.—We are informed that at a meeting of the Council held at South Kensington on Tuesday, 6th inst., the agreement as to the lease of the premises at 111, Victoria Street, S.W., was finally settled, and a sub-committee was requested to see the details of furnishing, &c., promptly carried out, as the exhibition on March 13 will be the last held at South Kensington. Reports were received and adopted from the Finance and Chiswick Committees whereby it is hoped that both increased economy and efficiency may be introduced into the Society's work. It was resolved to ask the advice of the Fellows' Committee on the following subjects, viz.:—1. The appointment of local secretaries in the provinces; 2. The best mode of affiliation between local societies and the Royal Horticultural Society; 3. The desirability of petitioning the Government to include Horticulture with Agriculture under the new Government Board. The next meeting of Council was fixed for March 13.

TUESDAY NEXT.—The last meeting of the three committees at South Kensington will be held on Tuesday next. A Council meeting, and a meeting of the Fellows' Committee will also be held on the same day, and in the evening Mr. LEWELYN will discourse on Sikkim Rhododendrons at the Horticultural Club. In the fitness of things, of course, this discourse should have been before the Royal Horticultural Society, but we are an anomalous people, and the Club has taken up work which the Royal Horticultural Society has allowed to drop out of its own hands.

CHISWICK.—The proposition to retire to Chiswick, advocated by some of our friends, has been duly considered, on commercial principles, but nothing was said publicly in its favour, *en temps utile*, as the French say; now, when it is too late, the proposition is revived, but business men know that such a step is impracticable. If all the operations of the Society were to be conducted there for one season no doubt expense would be lessened, but at the cost of life—the result would be paralysis for a year, and at the end the Society would, to use aibernicism, wake up dead. Town offices were felt to be an absolute necessity, and some means of getting money even more urgent. There would be next to no chance of getting this at Chiswick, while already the mere notification of removal to more central quarters has brought in an accession of new Fellows. Nevertheless, it is felt that one or more great gatherings should, if possible, be organised in the coming summer at Chiswick.

FINANCE.—The Finance Committee has been sitting with somewhat melancholy result we fear. Mr. DEAL, the Secretary of the Fellows' Committee should certainly have been added to this Committee.

GHENT QUINQUENNIAL REQUIREMENTS.—Great preparations are making for this exhibition. Among other things, the Directors are desirous of getting together a collection of the same species of plants that were exhibited at the first exhibition of the kind in 1808. Among the plants which are required are the following:—

Jasminum glaucum of ATON	Ceanothus discolor.
= J. ligustrifolium, rivulare, or Nycatanthes glauca, LINDLUS.	Aphelandra cristata = Justicia pulcherrima.
Rosa portlandica = R. ruficaulis.	Andromeda acuminata, ATON = A. lucida, JACQUIN.
Cineraria cruenta.	Phyllia plumosa, WENDEL = P. papillosa or excelsa.
Sedum angustifolium.	Phyllia spicata = P. oleoides.
Euryclides sibiricus = Paneracium ambrosiense.	Portlandia acuminata, WILLD.

Any one who possesses one or other of these plants is specially requested to communicate with M. CHARLES SPAE, Chaussée de Bruges, 261, Ghent.

THE BOULEVARD ASSOCIATION.—This useful metropolitan body still continues its good work, and has now taken in hand the strip of land which skirts the moat at the Tower of London. There is not much width in the space at the disposal of the authorities, and what there is lies at a considerable depth below the surrounding roadway, making it a work of some difficulty either to plant shrubs or form grassy slopes

which are likely to remain green in hot weather, owing to the excessive steepness of most of them. The idea to be carried out is that of an undulating bank 8–10 feet in height, and skirting the railings, the top only to be planted with shrubs. On the level ground at the foot a walk of good width will be formed, and on the north side, where a drinking-fountain is found, a rockery will be formed. The north-eastern part of the grounds is perhaps of an average width of 40 yards, and here there will be winding walks, flower beds, and shrubberies. The steepness of most of the banks seems to require that the major part of them should be planted with Periwinkle, Ivy, Cotoneaster, Creeping Berberis, Veronicas, Butcher's Broom, rather than to be turfed down. The first cost would be more, but the keeping afterwards less.

LINNEAN SOCIETY OF LONDON.—A meeting will be held on Thursday, March 15, at 8 P.M., when the following papers will be read:—1, "Monograph of the Thelephorea," by Mr. GEORGE MASSEE; 2, "Descriptions of Three New Marine Algæ," by Mr. EDWARD A. L. BATTERS; 3, "Exhibitions of the Os frontalis of a Hornless Stag, with Remarks on such Abnormality," by Mr. J. E. HARTING.

SOCIETY OF AMERICAN FLORISTS.—The programme of subjects to be discussed at the meeting in New York in the ensuing summer is given in the *American Florist*. Each subject will be treated of by some expert selected for the purpose, and others will be requested to make comments on the subjects:—

1. Roses. From the growers' standpoint.
2. Roses. From the retail florists' standpoint.
3. Ferns, Palms, and other decorative plants. From the growers' standpoint.

WHICH PLANT SHOWS ITS LEAVES EARLIEST?—The common Elder is one of the very earliest to unfold its leaves. On this account we turned to Prof. HOFFMANN'S "Phenological Charts," just published, and found that the Elder occurs wild throughout the whole of Europe, including the southern parts of Sweden and Norway, but not in Russia, extending thus over almost precisely the same area as the Blackthorn, *Prunus spinosa*, which, however, is much later coming into leaf. Honeysuckles, which belong to the same order as the Elder, expand their leaves very early; and *Lonicera tartarica*, either wild or as a cultivated plant, has nearly the same area as the Elder. The Birch, Bird Cherry, Red Currant, Raspberry grow all over Europe and up to the North Cape, but they are not so early as some of the plants already mentioned. *Deutzia scabra*, *Ribes*, *Solanum crispum* from Chile, *Photinia*, many of the Spireas, and other Rosaceous plants may be mentioned as plants which unfold their leaves early. It is hence clear that this precocity is not an affair of latitude or altitude only. The subject is one of practical importance as regards stocks for grafting.

"BOTANICAL MAGAZINE."—The March number contains coloured figures of

Vanda Sanderiana, Rehb. f., t. 6983, now sometimes called *Esmeralda Sanderiana*, and well-known to Orchid growers. It is also figured in *Gardeners' Chronicle*, vol. xx. (1883), p. 440.

Primula geraniifolia, Hook. f., t. 6984.—A species in the way of *P. mollis*, but the crimson corolla lobes are short and rounded, with a broad sinus between them.—Eastern Himalayas.

Mesembryanthemum Brownii, Hook. f., t. 6985.—A new South African species, with opposite linear glaucous pustulate leaves; flowers about 1 inch

across, deep lilac coloured, fading off into reddish-brown. Two of the sepals are larger than the other three, and provided with a short awn near the apex on the dorsal surface.

Heleniopsis japonica, Baker, t. 6986.—A bardy Japanese herbaceous plant, with tufted oblanceolate glabrous leaves. The flower-stalk rises from the centre of the tuft of leaves for a height of 4–6 inches, and bears at the summit a nodding raceme of flowers like those of a *Scilla*, but of a rosy-pink colour.

Osonna pyramidalis, Hook. f., t. 6987.—A handsome Borage-like perennial plant, from the Western Himalaya, with tufted basilar leaves, the stem leaves being sessile, lanceolate-birsute, and terminal clusters of vase-shaped flowers, like those of a *Symplytum*, but of a rich scarlet colour.

GLASGOW AND WEST OF SCOTLAND HORTICULTURAL SOCIETY.—It is intended to hold this year three shows—a spring, summer, and autumn. Over £500 in prize money to the last two shows will be given by the Executive Council of the International Exhibition of Glasgow. The spring show will be held in the City Hall, March 28; the summer show, July 11, and the autumn show, September 12, will both be held in the International Exhibition. The competition is open to exhibitors from any part of the United Kingdom, but the prizes are not too high, and are not likely to tempt Southern cultivators to go so far.

PLANTÆ DAVIDIANÆ.—M. FRANCHET has lately published in the *Nouvelles Archives du Muséum* the second part of his enumeration of the plants collected by the Abbé DAVIN in Eastern Tibet. Some of the species, as those of *Rhododendron* and *Primula*, have been previously published in the *Bulletin of the Botanical Society of France*, and commented on by us. A *Shortia* is described from Tibet. The plant known in gardens as *Rhynchospermum jasminoides*, but more correctly as *Trachelospermum*, was met with in Eastern Tibet creeping over the rocks. *Habernaria Davidi* is described as a very beautiful species. *Rhododendron Davidii* is remarkable for its flowers being in long racemes instead of in close trusses.

MANCHESTER HORTICULTURAL IMPROVEMENT SOCIETY.—The following is an extract from the report of the meeting which appeared in the *Manchester City News*, March 3:—

"The final meeting this session of the Manchester Horticultural Improvement Society was held on Thursday evening, March 1, in the Memorial Hall, Albert Square, Mr. BRUCE FINLAY, the President, in the chair. Mr. ROBERT KERR read a paper on the *Rhododendron*. Prior to the introduction of the *Rhododendron*, the evergreen shrubs of our landscapes and gardens were very few, and no plant has so altered the face of the country and all our gardens as the *Rhododendron*. Only 120 years had elapsed since the first arrival of *Rhododendron ponticum*, which came from Gibraltar, but the investigations of botanists proved that this was not the original habitat of the plant, as it had migrated from Asia Minor (one province of which is called Pontus), either by natural agency or by the hands of man in his westward progress, as the shores on the Mediterranean were gradually colonised from the East. About 1750 a general interest in the improvement of gardens began, and *Rhododendron ponticum* was eagerly cultivated and propagated; so much so that by the close of the century this now old-fashioned species had been planted freely by all the great landed gentry, and was to be found embellishing most gardens, with what beautiful effect was very evident at the present day. Our colonists in New England and Canada, partaking of the old tastes and likings for all that was beautiful, began to send specimens of their flora to the mother country. The first *Rhododendron* sent here appears to have been a tall straggling species, to which, from its being supposed to be the largest of its race, the name of maximum was given. The present glorious race of *Rhododendrons* had been raised as clearly and absolutely by the highest form of gardening as was the finest marble statue the work of the sculp-

tor's hands. He feared that too many of those people who saw these splendid plants at our exhibitions and in our gardens failed to realise the fact that they did not grow in any part of the world as wild or native plants, but were the result of skill and knowledge in improving even Nature itself. To Messrs. WATERER & GODFREY and Mr. CUNNINGHAM must be awarded most of the praise for these results, and he regretted very much that the real history of these now indispensable plants would much of it be lost, for little was recorded in the gardening papers, and it was greatly to be desired that a history should be written something like that of the Clematis by the late Mr. MOORE, of Chelsea, and the late Mr. JACKMAN.

CONIFERS ON THE MEDITERRANEAN COAST.
—Dr. HENRY BENNET writes from Ventimiglia:—

"I have read with great pleasure and interest the article in the *Gardeners' Chronicle* of February 25, on "Conifers on Chalky Soils." It seems to me a step in the right direction. I am not acquainted with any didactic work that takes up the subject of horticulture and arboriculture on the practical basis of soils. What are the plants, shrubs, or trees that are peculiar to chalky, to sandy, or to peaty soils, and require these soils for their full and healthy development? I presume that nearly all plants will thrive on good loam, but in chalky, sandy, or peaty soils good loam is often difficult and expensive to get. Sooner or later the plants artificially planted in it get to the substratum soil of the country, which disagrees with them, so they droop and often die. I have always felt the want of such a work, my two gardens having been, the one in Surrey, on the Bagshot sands; the other on the Genoese Riviera, on limestone rocks, with very little vegetable soil in either except specially imported. I was very glad, therefore, to read the article in question, which quite corroborates my own experience; but I think I may add a large tribe of Conifers to those named—that of the Cupressus. All the Cupresses that I have planted here on my lime rock have lived. Some have done very well, others less so; but apparently more owing to excessive dryness of climate and to want of sufficient soil, than to the soil itself being antipathetic to them, and the same Cupresses planted on terraces within a few feet of the lime soil, and with artificial moisture, have done very well. Firstly I would name *Cupressus macrocarpa* or *Lambertiana*, for I presume they are mere varieties of the same tree; it does splendidly all along the limestone coast from Marseilles to Genoa, wherever it gets plenty of soil and a moderate amount of moisture, forming a rather low tree with wide-spreading lower branches. Following on the same lines as one of your late correspondents I am endeavouring to drive mine up by cutting the lower branches. This I used to do in Surrey on the Bagshot sands with great success. The *Cupressus sempervirens* var. *fastigiata*, usually called here *pyramidalis*, rising up like a Poplar, is quite at home in a lime soil all over the Mediterranean. It is planted as a protection against winds, and in cemeteries universally, arriving at its full development in such soil everywhere. The *Cupressus* that does the best with me is the *Cupressus excelsa*; *C. pendula*, *C. glauca*, *C. elegans*, all do very well, form very handsome trees, and grow as luxuriantly as the paucity of soil and the extreme dryness of the climate in summer admits. The *Cupressus Macnabiana*, as it is called here by nurserymen, grows vigorously and healthily, but more as a bush than as a tree. The soil and climatic conditions of the Riviera already suit the constitution of these trees, indeed, I am gradually driven on my soils to plant Cupressi to the exclusion of other Conifers, always excepting the *Pinus Halepensis* or *Aleppo Pine*. This latter everywhere covers the lime rocks of the islands and shores of the Mediterranean, and may be considered the Mediterranean Conifer *par excellence*. The *Pinus maritima* also does very well in the rocky arid regions of the Mediterranean, the climate evidently agreeing with it, but the soil must be sandy or partly sandy. Wherever a sandy or siliceous soil appears it flourishes, but it does not appear in masses in purely limestone regions. I have several doing well on my limestone rocks, but I believe they have found out some of the pockets of sand which occasionally exist in these rocks, for they are the survivors of a hundred planted; the *Halepensis*, on the contrary, grows everywhere like a weed, with little or no soil, its roots penetrating into the crevices of the rocks. The *Abies Pinsapo*, or Spanish Fir, does moderately well in the Mentone district, but dies with me, probably because the rocks are too arid and too dry. The *Cupressus californica* does well, but it is with me a straggling, badly-grown

tree, and I am gradually eradicating it. The *Thuja gigantea* does well; it covers the limestone rocks of the Atlas Mountains in Algeria. The Junipers do well here as bushes. I have formed one into a handsome tree, 16 feet high, by constantly pruning off the lower branches—the plan, I believe, by which tree *Rhododendrons* are formed. All the Conifers hanging on the sides of the rocks have a tendency to form bushes, no doubt owing to the full and constant exposure of the lower branches to the sun and air; but this tendency I find can be counteracted by cutting away the lower branches, beginning when they are quite small, and cutting several feet from the ground. In most trees, I believe, the larger branches appear within 10 or 15 feet from the ground, and if they are cut off the tree runs up in height without forming large branches. The Junipers which cover the limestone rocks in this region, flourishing in the lime soil, are *J. oxycedrus*, *J. communis*, *J. nana*, Willd.; *J. phoenicia* (*Ardoino's Flora*).

BIRMINGHAM GARDENERS' MUTUAL IMPROVEMENT ASSOCIATION.—This thriving Society still continues to increase in point of numbers, about thirty new members having been added since the commencement of the year while, the library and other property has increased so rapidly that it has been thought advisable to appoint trustees, consequently a summoned meeting of members was held on Tuesday evening, February 28, at the Midland Institution, when the following were unanimously elected for a period of six years:—Sir THOMAS MORTIMER KNIGHT, II. F. OSLER, Esq., Mr. W. B. LATHOM, Mr. W. JONES, Mr. J. POPE, and Mr. J. CROOK, the whole of them being members of the Association. Their new bookcase, too, which it was thought would furnish sufficient accommodation for several years, has been found sadly too small it was therefore resolved that a much larger new bookcase should be ordered at once, in order that several kind offers of books may be accepted before the close of the spring season. Mr. T. F. RIVERS will read a paper on the "Cultivation of Fruit Trees in Orchard-houses," at their next meeting on Tuesday, March 13.

ROSE SHOWS IN 1888:—

- June 30.—Eltham and Reigate.
- July 3.—Bagshot, Canterbury, Diss, and Hereford.
- .. 4.—Croydon.
- .. 5.—Bath, Farningham, Hitchin, and Norwich.
- .. 6.—Sutton.
- .. 7.—Crystal Palace (National Rose Society).
- .. 10.—Ipswich.
- .. 11.—Tunbridge Wells.
- .. 12.—Winchester.
- .. 17.—Leek and Ulverstone.
- .. 18.—Birkenhead.
- .. 19.—Helensburgh.
- .. 20.—Darlington (National Rose Society).

INSECTS AND FUNGI IN CROPS.—Mr. CHARLES WHITEHEAD, the Agricultural Adviser, has, says the *Times*, presented his first annual report—that for 1887—to the Lords of the Committee of Council for Agriculture. The report, which is now published as a Parliamentary paper deals with insects and fungi injurious to the crops of the farm, the orchard, and the garden. It has been prepared in consequence of an arrangement to publish an annual account of the diseases and disorders that have affected the crops during each year, with descriptions of the insects, fungi, and other causes of plant affections, and of other matters connected with agriculture that have been referred to the Agricultural Adviser. Detailed particulars of the various attacks are to be added, and the means of prevention which should be taken and remedial measures likely to be useful. Cultivators are invited to send accounts of unusual attacks of all kinds, as well as to apply to the Department for information upon all points in connection with the diseases of cultivated plants, and with regard to seeds and fruits and the treatment of crops. As Mr. WHITEHEAD's appointment was only confirmed last July, and it was not decided to publish an annual history, of this kind till late in the autumn, the descriptions and records of the attacks upon crops given in this year's report are few. During 1887 the diseases and disorders

of cultivated plants were not in any degree unusually prevalent or excessively injurious. The attention of cultivators with regard to insect pests was chiefly directed to the Hessian fly, which spread over a considerable part of the eastern counties of England and Scotland, though it has not yet been discovered in Wales or Ireland. The loss occasioned was not very important, and it is hoped that in consequence of the peculiarly variable climate of this country the fly will never be very destructive in Great Britain. Much more damage was done to crops by other insects, chief among them being the riband-footed corn-fly (*Clorops tenipus*) and the corn saw-fly (*Cephus pygmaeus*), whose injuries to Wheat and Barley plants have been unprecedented. In some districts much harm was done to Turnips by the Turnip aphid. In parts of Kent and Sussex the Hops were attacked by an insidious fungus called the Hop mildew (*Podosphaera castagnei*), allied to the fungus that is so dangerous to Vines in France and Germany. There was also a great deal of sickness in Clover, caused by the eel-worm (*Tylenchus devastatrix*). For these pests remedies will be found suggested in the report.

WIRE.—The price of wire arches and fencing is likely to go up, indeed those who are in want of the commodity may have some difficulty in procuring it, owing to the great demand for wire-fencing in Australia in consequence of the plague of rabbits. We are credibly informed that no smaller quantity than 100,000 miles of wire fencing 42 inches high has been ordered in this country, and one firm alone has undertaken a contract for 25,000 miles. Happy wire-workers!

THE QUESTION BOX.—The Society of American Florists has established a "question box." Replies to the questions will be contributed at the ensuing general meeting in New York. Among the questions already received for discussion at the New York meeting of the S.A.F. are the following, which we insert as a hint to the new Council of the Royal Horticultural Society:—

Can plants of *Ixora* and other stove plants be grown so that the flowers may be sold at a profit?

Is the sale of *Chrysanthemum* flowers an injury to the cut flower trade?

What is the best method of preserving wood in greenhouses?

What qualifications are necessary to become a commercial florist?—a private gardener?—a landscape gardener?

How can we prevent excessive waste of fuel?

Is the practice of suddenly advancing the price of cut flowers injurious to the trade?

What can be done to render horticultural exhibitions of greater benefit to the trade?

Is a wholesale cut flower market desirable in large cities, and if so, which is the best manner of conducting them?

Which are the best six Carnations for florists to grow?

How many varieties of Tea and hybrid Tea Roses are necessary for the general grower to have, and which are the best varieties?

Which are the most profitable varieties of H.P. Roses for forcing?

Which are the best Ferns for the general retail business?

Which are the best varieties of *Chrysanthemums* for cut flowers?

Which are the best Orchids for florists?

What is the best method of propagating *Acacia pubescens*?

Which method of circulating hot-water in greenhouses has been proved by actual experience to be the best?

What are the best materials to use in building a flue?

Which varieties of recently introduced Roses are suitable for forcing?

Have greenhouses constructed entirely of iron and glass been satisfactory in this country?

Are we not going to extremes in carpet-hedding? Is the mail trade an injury to the general trade?

TRADE NOTICE.—We learn that Mr. JOHN MATTHEWS, of the Royal Potteries, Weston-super-Mare, will very shortly retire from business.

BOOK NOTICE.

ALLOTMENTS. By the Rev. W. Tuckwell, M.A. (Jarrold & Sons, 3, Paternoster Buildings, London.)

How important is the question of allotments to the working man regarded outside of Parliament and politics, is evident from the discussion of the topic found on every hand, and to which a notable addition is furnished in the pamphlet before us. We find here the opinions, not of any mere theorist, but of a thoroughly practical writer, although found in the person of a clergyman. The Rev. Mr. Tuckwell, Rector of Stockton, Rugby, is a very advanced parson, and a staunch party politician; but most wisely, he does not allow his party proclivities to disfigure his pamphlet. His sympathies with the labouring classes are evidenced plainly, and as the life owner of some 200 acres of glebe land in his parish, he has, without the sanction of his Bishop, who was opposed to the scheme, converted this large area into allotments of diverse extents; and although the crops and working are partly agricultural, and the experiment has been in operation but two years, with a very dry summer to be encountered, still capital results are shown, which gives the reverend author the fullest right to discourse upon a question with respect to which so many are anxious, and yet comparatively so few are fully agreed. It is with exceeding interest we read Mr. Tuckwell's description of the evolution out of stony moorland at South Taunton, on the borders of Dartmoor, solely through the persistent energy and untiring exertion of the labourers, of some 200 acres of splendid allotment land—the way in which it was drained, fenced, and cultivated—of the contest between the occupiers and the officials of the Cornwall Duchy, and of its final deliverance from the Duchy grip on payment of a sum of £104. Fifty years ago the land was rated at 47. per acre, now it is rated at 20s. per acre. Then one-third of the inhabitants of South Taunton were paupers, now only three are so classed. Then crime was abundant, and immorality was excessive; now all is changed for the best, and this, too, through a piece of almost wild moorland. If such important pecuniary and social results followed in this case, why may not similar good follow in myriads of cases in which, through allotments, the labourer may be made to feel that he has a stake in his country, and a spur to the improvement of his social condition.

Mr. Tuckwell defines an allotment to be, not a holding, which furnishes a complete livelihood, but rather such an area of ground as a man can work to his aid and benefit during spare hours. He refers us to the Enclosure Act of 1845, which provides that certain portions should be set apart for labourers' allotments, but the matters seem to have been lost sight of. The present demand has been awakened by improved education and greater political enlightenment, hence the new and remarkable interest shown in the subject. The author holds that allotments should not exceed in rental the average agricultural rent of the district, that they should be held under a sort of perpetual tenure, or, at least, that dispossession should follow in the case of residents, only from gross neglect in culture, or serious misconduct; also that no hard-and-fast line should be drawn as to area, as he has found at Stockton that whilst some could cultivate two acres well and profitably, others could only manage one-fourth that area. It is desirable also that the land should be near to the labourers' cottages, but that

may not in all cases be easy to secure. An ideal rural village would probably show areas of half an acre to two acres of land attached to each cottage, with a common run for cow pasturage, and a wide expanse for the village green; but we are just now more concerned with villages as they are, hence allotment ground must be obtained with what convenience offers. Mr. Tuckwell becomes far less practical when he labours to show that such odd crops as Tobacco, Flax, Beet for sugar, woad for the dyer, Stramonium, strangely termed a native English plant, and recommended as a cure for asthma; Teasel, &c., would prove profitable. We think in Potatoes, Peas, Cabbages, Carrots, Onions, and other well-known garden crops, allied to some corn and cows' and pigs' food, the allotment holder would find his best returns.

The writer makes little reference to fruits, but he has looked at the subject more from a farmer's than from a gardener's aspect. Allotments for town artisans are advocated, but these must largely be extra-mural, and in the vicinity of railway or tram-car stations. To improve the general gardening knowledge of the working classes elementary school training is advised. Obstacles to that desideratum are, however, many. The pamphlet closes with a reference to the Allotment Act of last year, from which Mr. Tuckwell does not expect much, because of its complex construction. We cordially commend this new addition to the allotment discussion to the attention of our readers.

TREES AND SHRUBS.

TREES FOR THE CHALK.

I SHOULD like to add to Mr. Webster's list of trees suitable for chalky soils (p. 231), knowing how important it is to have as full a list to choose from as possible, short though it may be when every suitable tree is included in it. No coniferous trees are better for the chalk than the Mount Etnos (*A. cephalonica*) and Spanish Firs (*A. Pinsapo*), and they represent well the conical or pyramid style of coniferous tree. The Pines that flourish perfectly are *Pinus insignis*, *austriaca*, *excelsa*, and *Pinaster*; but, of course, due notice must be taken of the tenderness of *P. insignis* in cold districts. The grassy-green of the *insignis* is, I think, brighter on the chalk than on the other soils, and contrasts strongly with the heaviness of the Austrian Pine, than which no tree could possibly thrive better on the poorest of chalk soils. *P. Pinaster* is not a favourite with me, but I should plant it especially in coast districts. *P. excelsa*, a favourite with every one, may be planted in the thinnest of soils, and even in exposed places, though it is grateful for shelter. Another Conifer that thrives to the greatest perfection on chalk is the Monterey Cypress (*Cupressus macrocarpa*), and it is invaluable on account of its luxuriant verdure and dense growth. If it does behave at all differently on chalk than on other soils, it is denser in growth, but in windy places it does not rise so high. Some of the finest Monterey Cypresses I know are in a small garden near Goodwood, where the soil is all chalk, and just in the teeth of the wind. The Nootka Cypress (*C. nutkaensis* alias *Thuryopsis borealis*), does well on chalk, but is not so fine as on a better soil. It soon gets thin, and has a ragged appearance. The Deodar and the Atlas Cedars do admirably, but they both dislike exposure on such thin soils. The Lebanon Cedar, too, is quite a chalk lover, for finer than those at Goodwood could not be seen, and equally fine are those at Wargrave, in Berkshire, where on a hill exposed to the full south-west are some gigantic trees, yet the soil is pure chalk, with only a top skin of good soil about 9 inches deep. The Lebanon Cedar stands exposure well if the soil is chalky or otherwise poor, but if good the trees are of quicker growth, and more liable to injury by wind and snow. The Sequoia gigantea, as Mr. Webster says, does well in some places on chalk soil, but it is not to be depended upon, and I believe that chalky soils vary considerably in different localities in regard to their chemical nature, which has an effect upon certain trees. Last autumn I made a tour of the principal places for

trees on the chalky south downs of Sussex with the view of seeing the trees which flourished there, and I was struck with the luxuriance of some Sequoias in one place, while at another place, not 5 miles distant, growing in what appeared to be the same kind of chalky soil, the trees were wretched. There are about a dozen large coniferous trees that may be relied on for planting in chalk, in addition to the Yew, which is quite at home on the poorest of chalks. The deciduous trees and shrubs that thrive on chalk are not so limited, and I was surprised to find what a large number of species (quite an arboretum, in fact) there are at a place I am engaged upon now, in the heart of the Sussex south downs, the glory of the place being the evergreen Oak, which is beyond all evergreens the tree for windy chalk downs. As a select list of flowering deciduous trees and shrubs that I observe do well on chalk I may send you a list. H. G.

PHILLYREA VIMBORINIANA.

We have frequently had occasion to mention the excellent qualifications of this comparatively new evergreen shrub and may now add to its reputation by stating that not only is it hardy, but that it is capable of withstanding the smoke-laden atmosphere of towns. We have had it under observation for the last three years in a town garden, where the proportion of impurity in the atmosphere is very large, but not large enough to hurt this handsome evergreen. *Skimmia japonica* is equally indifferent to cold and smoke.

NURSERY NOTES.

MESSRS. J. LAING & SONS.

TUBEROUS BEGONIAS AND OTHER SUBJECTS.—In the propagating department of this nursery tuberos Begonias are the plants mainly dealt with at this season of the year. Although propagation by cuttings is resorted to when any particular plants are to be increased in number, that of raising from seed is preferable, so true from seed come the various colours, and so free growing are the plants thus raised. The first and chief sowing was made in January, and the earliest have been pricked off into square or round pans already, some 500 in a pan of 9 inches square, of which 80 per cent. will grow and form flowering tubers this season; the loss of 20 per cent. arises sometimes from a growth of moss on the surface of the soil, and at others from the presence of salts in the materials of which the pans are made. Before the plantlets quite touch each other they will be removed to other pans holding, perhaps, eighty of them, and finally into boxes of forty each, where they remain till the planting-out time arrives. The smallest Pea-like tubers of last season's raising that have been kept in small pots covered with cocoa-fibre go into pans and boxes in the same way as this year's seedlings, but at a slightly greater distance apart. Larger tubers than Peas are put into pots ranging in size from thimbles to 48s.

All this Begonia business is in full swing at the present time; the numbers intended to be bedded out will be far in excess of last year, and will probably reach 80,000. This is a sign of the growing taste for this plant as a bedder or pot plant, and especially in Scotland and America, whence great numbers are sent.

A new race of Begonias is to be found here destined to replace the Rex varieties. The habit is midway between that of *B. discolor*, *B. Evansiana*, respectively on the one side, and the Rex varieties on the other; this is remarked in the taller, more upright, shrubby growth, and in the deeply serrated leaves, which are also furnished in many instances with red coloured ribs, as in *discolor*. The variety Princess Clementine, figured in our last number, was of this new type.

Some varieties of Caladiums of fine markings we observed—some of the choicest of *M. Bleus'* raising.

amongst the number; *C. erubescens*, a dwarf growing variety with red and green leaves, and of about the stature of *C. argyrites*, is one of these. It should prove of value for small designs in indoor arrangements, as on the dinner-table, and for small vases, jardinières, &c.

Of other winter flowering plants in bloom, too apt to be overlooked by gardeners, were *Thunbergia Harrisii*, small plants in 32's, carrying many of their light blue *Convolvulus*-like flowers; *Clematis lobata* and *C. l. indivisa*, profuse flowering greenhouse climbers, with white flowers, identical in size, and differing merely in the leaf. In the stove many plants were observed of *Thysacanthus rutilans* either in flower, or showing their flower racemes. *Lasiandra macrantha*, a large plant, growing in a pot, had just gone out of bloom.

THE ALPINE GARDEN.

DIAPENSIA LAPONICA.

This name occurs in the list of desiderata of the Cambridge Botanic Garden. A gentleman who was in Iceland during last summer gave me a plant, and if I find it still alive in May I shall be agreeably surprised, as it is an old plant, and has had its long tap-root cut nearly at the ground line, and I fear is hardly likely to throw out new roots.

This neat little plant is figured in Edwards' *Botanical Register*, as well as in the *Botanical Magazine*, but it does not seem ever to have been established long in cultivation. It is as close growing as the smaller species of *Androsace*, the flower being more like that of a diminutive alpine Pink. In Europe its distribution seems to be limited to Iceland and the northern parts of Scandinavia, but in North America it is found in the latitudes of the Alps and Pyrenees, as it occurs at elevations of about 6000 feet both in the Adirondacks and the White Mountains. The gentleman who gave me the plant says that in Iceland it grows in deep loam, with wry tap-roots 4 feet long, and states that the flowers there are oftener bright pink than white; both the figures above referred to represent them as white. If young plants could be brought to England they might survive the cutting off of their tap-root, and give us a fair chance of establishing and reproducing from seed this very neat little plant. Seed from wild sources is always difficult to get in the case of such plants, which are deeply covered with snow almost before the seed is ripe; and, as I find to be the case with plants like *Arenaria verna* and *Silene acaulis*, which form similar long tap-roots, it is hardly possible to transplant old plants successfully. Plant collectors should bear this in mind, as they are almost always inclined to bring away the finest specimens. *C. Wolley Dod*, February 12.

FLORISTS' FLOWERS.

THE PHLOX: ITS PROPAGATION AND GENERAL CULTURE.

Of all herbaceous perennials this is one of the easiest to grow, and a plant put out in the border, in good soil, will grow and flower in the same place for a quarter of a century, the plants spreading out to a large size, the spikes becoming more numerous and smaller in size year by year. No good gardener would be satisfied with this system of culture, but if there is any love for his plants he would endeavour to bring them up to the highest point of excellence that they are likely to attain. Now, in the first place, the Phlox is a gross feeder, and can appropriate as much rich food as any other garden plant known to me; and this is supplied by trenching in, before planting, plenty of good farmyard manure. If this can be done early in the autumn, all the better; and the plants may be put out either in the autumn or early spring. I like to prepare our

own plants, and it is done in this wise. Take the cuttings in March—as soon as they are long enough, in fact. The shoots, when 2 inches long, may be slipped off with a heel, and be inserted singly in thumb-pots. They will root in a cold frame, or more quickly over a hotbed. When well-rooted, re-pot each into a 5 or 6 inch pot, and they will form excellent flowering plants for the greenhouse or conservatory the following autumn; each will give one spike of bloom. These are the plants which ought to be planted out in the border next season, and every one of them will produce from three to five spikes. It is marvellous how rapidly these plants send out roots, which in their turn extract the moisture and food properties from the soil. It is therefore necessary to mulch round the roots with some decayed manure, and to give copious supplies of water in dry weather. The stems must be supported with sticks in the early stages of their growth, else they are not unlikely to snap over close to the ground when exposed to the first high wind.

Some may consider that so much trouble is unnecessary, and that Phloxes can be readily propagated by digging up an old clump and chopping it in pieces with a spade. This is so, but such a rough and ready mode of treatment is not gardening in the highest sense, and the best results are impossible if the plants are managed in that way. The Phlox can easily be raised from seeds, which, of course, should be saved from the best varieties. It is easier to raise and flower the plants than it is to produce any distinct and good varieties; but if there are not many good ones in a large batch of seedlings, there are few bad ones. If the seeds are sown early in the spring on a hotbed, the plants will produce flowers the following autumn, and they will make a brave show in the garden. They will, of course, flower best the second year, either in the same place or replanted. *J. Douglas*.

THE PINK.

This is perhaps the most esteemed of all the hardy plants grown for forcing purposes. It is too late to look after the plants now for the present season, but those who are in possession of a stock of strong plants ought to place a few into the forcing-house every three weeks. Keep them free from insect pests, and close the roof glass, and as the flowers show colour let them be removed into the greenhouse to fully develop. As soon as cuttings can be obtained they may be taken off and struck in a hotbed—not where there is any very great heat, but where the heat has subsided. Early propagated plants are essential to the production of good specimens equally as for large heads of bloom. The young plants when rooted should be grown on in boxes, and managed so that they may be planted out about the end of May in an open well-manured piece of ground. The recent searching frost-wind has been very trying to young plants of laced Pinks out-of-doors, throwing them out of the ground, and altogether checking the little growth they made during the mild weather early in February. My own have been frozen hard, and many of them with the roots exposed. The weaker plants may succumb to it or be irretrievably crippled; in that case it is well to be able to draw from a reserve stock of plants wintered in frames. I recommend a pair or two of each variety to be planted in 60-sized pots in the autumn. They are invaluable to fill up any blanks caused by the weather, slugs, or grubs during the winter and early spring.

THE PANSY.

The growers and admirers of this lovely flower are now more numerous than ever. It is, like the Pink, easily grown, and is quite as liable to be injured by being thrown out of the ground during alternate frosts and thaws, and to be devoured by slugs and the leather-coated grubs. To have a good bed of Pansies early in bloom, the plants should be established early, and ought to be moderately strong in the autumn. If the roots have penetrated deep, and have firm hold of the ground, there is no danger of injury

from frost; but in case of accidents I always have a few in pots or boxes sheltered in cold frames. Spring planting must be trusted to in any case for the whole collection this year, it was so difficult to get the cuttings to produce roots during the hot dry weather about the end of summer last year. The Pansy more than the Pink delights in a rich deep porous soil, and a cool, rather moist atmosphere is most suitable during the summer months. The Pansy is a very good subject to grow in pots for spring flowering. In the early years of my florist experience they were popular as exhibition plants at the spring shows, and when bi-monthly shows of the Royal Horticultural Society were established the Pansy was one of the flowers invited, and very beautiful examples were exhibited by Mr. James, now of Farnham Royal, and others. The plants are placed in frames near the glass, and the flowers being protected from the weather are rich and clear in colour. They do not like peat in the soil, but good loam three parts, one part leaf-mould, and as much decayed cow-manure, suits them admirably. A specimen plant in an 8-inch pot will have from eighteen to twenty-four flowers or more open on it at one time. Chinese Primroses, Lily of the Valley, Spireas, Dielytras, and all sorts of hardy flowers, are invited at spring shows in these latter days, but not Pansies. Even at the great Northern exhibition, Newcastle-upon-Tyne, they are omitted. This should be rectified in the future. *J. Douglas*.

THE MELON-PEAR.

A good deal has been written about this fruit, which has been introduced from Guatemala into the United States. Those who advocate popular names will rejoice over this, which is neither a Melon nor a Pear, nor a compound of either! It is the fruit of a *Solanum* (*S. guatemalense*?) allied to the Egg-apple (popular names again!), the Aubergine, the Tree Tomato (*Cyphomandra betacea*), and not far off from the Tomato itself. Its use, therefore, would be as a culinary vegetable. The Editor of the *Orchard and Garden*, from which we copy the illustration (fig. 49), describes the fruit as somewhat larger than a hen's egg, pale lemon-yellow striped with purple, beautiful and attractive in appearance, and with a distinct spicy aroma. The flesh is pale yellow, seedless, with its exceeding sweetness tempered with acidity, and a flavour decidedly resembling that of the Musk Melon. Peter Henderson—and he ought to know—reports that he has tried it, and formed no high opinion of it; but for all that it might be suitable for some of our warmer colonies either as a fruit or a vegetable.

HOME CORRESPONDENCE.

THE ROYAL HORTICULTURAL SOCIETY. — I agree with every word Mr. Fish has said in reference to the absurdity of appointing an Hon. Secretary as an officer of the Society; this appointment has been in the past a great hindrance to the success of the Society. I do not refer to persons, but to a principle. I know when the state of affairs was something in this wise—the Society had a paid Secretary, a man of considerable energy, and who made many suggestions which had been carried out would, I believe, have been the means of promoting the interests of the Society—but, before his suggestions could reach the Council he had to consult this useless bit of furniture, the Hon. Secretary, and if the suggestions did not meet with the approval of this august personage nothing further was heard of the matter, and the result was that the paid Secretary in process of time lost all interest and allowed things to drift. It must be obvious to all that the senseless arrangement now in operation must engender a feeling of restraint on the part of the paid official. Would any member of the Council adopt such a suicidal policy in connection with his own business? My suggestion is, Get a good man; pay him well, and away with useless restraining influences. The plan proposed is unsound in principle, hostile to the interests of the Society, and opposed to its prosperity. *Observer*.

— The matter of gardeners' Fellowships is so important just now, that I am sure you will permit me to correct a couple of wrong impressions that the misplacement of a comma, and the omission of a word or two in my last letter, must have created. In claiming an equality of power or of status for gardeners, I also advocated that the privileges might be varied with the rate of subscription. The line—I forbear to quote the sentence, reads thus:—"I protested against any inferiority either of power or of status as the privileges"—place a comma after status and the meaning becomes plain. In the next sentence insert the words, "must be patent to all," after practical gardeners, and begin the next sentence with, "The Society has nothing to fear," &c. We have precedents for all I demand on behalf of my class in existing arrangements. Twenty-guinea Life Fellows, or the guinea annual subscribers, have half the privileges, and get all the power and status of the forty-guinea Life Fellows and the four guinea annual subscribers. Why not, then, give guinea Fellows half the privileges of two guineas, and half-guinea Fellows half the privileges of guinea ones? What could be more reasonable or just than such an arrangement? Of the ten privileges of Fellows the Society offers to its Fellows, the following four are those that should be equally enjoyed by all, whatever their rate of subscription or qualifications as honorary members:— 1, Admission to all shows; 2, the right of voting at all meetings; 3, free admission to reading-room and Lindley library; 4, a copy of all the publications of the Society. Neither could there be any practical difficulty nor injury to the Society in allowing a few orders of admission, or the distribution of a fair proportion of choice scarce seeds and plants among the cheaper Fellowship. As to the charter, or charters rather, the major portions of them are already repealed by the force of circumstances or the irony of events, and there is nothing in the original charter that forbids justice being done to all classes of Fellows. For as it sanctioned that two-guinea Fellows should have half as much as four-guinea ones, and also that the privileges of one-guinea Fellows should bear some sort of relation to two-guinea ones it will and must also admit half-guinea Fellows to a quarter of the privileges of the two-guinea ones. This is all we claim, and desire to pay for with our money. *D. T. Fish.*

— As everyone in the country expected, the Royal Horticultural Society has come to grief. The Society was always offhanded with its country gardeners; we were not admitted to their cliques. When we went there no one knew us, and if we happened to make ourselves known to a nurseryman of the party they dropped upon us like "carrion crows" for an order. The Society, in fact, cast us off, and of it, I fear, I cannot be said, as Goldsmith, in his *Retaliation*, said of some one—

"He cast off his friends, as a huntsman his pack,
For he knew when he pleased he could whistle them back."

I fear the Royal Horticultural Society will have to whistle pretty loudly and often to recall some of those hounds whom they were in the habit of casting off so shabbily. Of the Royal Horticultural Society, surely it may also be said of them, as of the children of Israel, viz., "A remnant shall be left." With this remnant as a nucleus can they not make a fresh start? There is plenty of cheap land in the country, goodness knows. We read of cheap purchases in every day's newspaper. Lord Salisbury the other day bought a 500-acre farm for £10 per acre: surely the Royal Horticultural Society might do likewise. [It is too near to bankruptcy to do that. Ed.] On such space as that they could experiment *ad libitum*. Have it by all means near to a station, on say, the London and North-Western, when it would be easily come-at-able by people from the northern part of the kingdom, when on their way to and from the great metropolis. Chiswick is too much out of the way; besides, there is no elbow-room there for expansion. Advertise for a piece of land on which may be found a variety of soils, such as light loam, heavy loam, and peat. Let the fresh start be hale and healthy, not a hole-and-corner business, as the history of the Royal Horticultural Society has shown it to be. Bad navigators as they have proved themselves to be, surely there may be found amongst them some experienced "mate" who has been taking quiet note of the different and many rocks on which they have split, and wrecked such a lot of money. With a fresh start—nothing but a fresh start—and a healthy crew can the old ship—not

a phantom one—be again launched. Thus healthily officered there will soon be plenty of recruits and willing cadets ready to join. I doubt the wisdom, in this case, of Solomon's proverb, "In the multitude of counsellors there is safety," but believe rather in the reverse one, viz., "That too many cooks spoil the broth." This leads to the suspicion, and hence to the conclusion, that had there been fewer cooks in the kitchen of the Royal Horticultural Society the soup to-day might have been all that was desired. *A Voice from the Midlands.*

— I am pleased to find so powerful a pen as that of Mr. D. T. Fish employed in condemning the proposed half-guinea Associateship of the Society without full member's privileges. Without doubt Mr. Fish in this matter represents the general opinion of gardeners in relation to this unfortunate proposal. Much as I desire to become a half-guinea member of the Society, I should with all possible contempt reject the offer of Associateship even for half a guinea on the degrading conditions proposed. I decline to admit that the Fellow who pays his guinea per annum brings to the Society more brains or professional knowledge or reputation than I do, merely because his circumstances in life enable him to pay double that which I can afford. I had

FIG. 49.—THE MELON PEAR (*SOLANUM GUATEMALENSE*), REDUCED. SEE P. 305.

far better in the matter of full and equal privileges become a member of the National Chrysanthemum Society, with a five-shilling annual subscription with the privilege of attending not only three or four fine exhibitions in the year, but also several floral meetings and the Society's biennial meetings, than pay double the amount to the Royal Horticultural Society for dubious privileges and be entirely debarred from the chief and only tangible one, that of taking part in the Society's business meetings. I declare that it is a monstrous absurdity to propose to provide representatives of the gardeners of the country in the shape of gardening members of the Council, and at the same time to shut out the mass of the gardeners from the right to vote in favour of their assumed representatives. Far better such an ignominious proposal had never been made. I beg to be allowed to call attention to the fact, that in the suggestions made to the council by the Fellows' Committee appointed in February, 1886, appears the following recommendation:—"The committee are of opinion that properly recommended working gardeners should be invited to become Associates of the Society at an annual subscription of half a guinea, such members to have the same privileges as the one-guinea members." That report was signed by Mr. H. J. Veitch, who is now a member of the Council; and as one who has always shown himself a real friend and respecter of gardeners, I hope he will have the courage to insist that not only shall there be the same voting privileges granted to half-guinea sub-

scribers as to subscribers of other amounts, but also that he will object to the diverse, invidious, and ridiculous nomenclature proposed of Fellows, Members, and Associates. *Spade.*

JANUARY WEATHER NORTH OF THE GRAMPAINS.—The past month (January) having been of an unusually mild character, as well as the early part of the present one (February), I am induced to send you a statement of the maximum and minimum temperatures up to this date, on the consideration that they may prove interesting to some of the readers of the *Gardeners' Chronicle* to compare with their own. Owing to the mild temperature accompanied with a good deal of sunshine vegetation had made considerable progress and was getting prematurely forward, until the 13th inst., which brought us a change of weather to frost and snow! Bees were seen working on *Garrya elliptica* on January 9, and on the 10th a spotted butterfly was sporting and sunning itself against a south wall of the garden. Bees were again out working on *Crocuses* and *Snowdrops* in front of my house on January 23. Clematis, Roses, Honeysuckles had well started into growth, and fruit-buds were also in a forward state when the frost came. Apricots, through having had a good protection of Fir branches and double matting put on at the commencement of frost, have now some of their flowers fully expanded, although we had 15° of frost on the night of the 14th and 15th inst., they are still uninjured, as the enclosed spray will show. [Plenty of flowers, and uninjured. Ed.] The subjoined is an extract from readings daily recorded here. This being a station for the Scottish Meteorological Society, instruments are all regularly tested, and may therefore be relied upon as being correct.

J. Webster, Gordon Castle, Banffshire, February 23.

EUGHARIS AMAZONICA.—At Mr. Phillips' Royal Torbay Nurseries, Torquay, I lately saw a fine lot of this plant with dark green foliage, and studded with numerous spikes bearing large flowers. They were growing in strong retentive loam, bordering on clay, minus the usual auxiliaries mostly used in growing *Eucharis*. These plants are unfortunately badly infested with the mite. Yet I can well understand such robust health keeping at bay these pests; but as I looked on these plants and admired their beauty, growing with such vigour in strong loam, and comparing them with the many miserable samples I had seen lately in different parts of the country, struggling hard for a miserable existence in light soil, peat, rotten manure, sand, and in some instances

leaf-mould, literally eaten up with mite and fungus, the question which came in my mind was, to what extent may success or failure be due to the soil? But this I leave to others for an answer. I will only add that the employment of strong retentive loam, instead of the usual mixtures one so frequently sees used and recommended, may be worth the consideration of those who have healthy Eucharis, and wish to maintain them in that condition. *C. B. Keetley, Torquay.*

ALLAMANDAS DRYING OFF.—Your correspondent, "Mayflower," says Allamandas should not be dried off. Now I have never seen the Allamanda flower freely one year after another when treated as an evergreen. We have a plant here of Allamanda Hendersoni planted out in the stove, which flowers every year eight months out of the twelve, and has done so now for several consecutive years. We cut the plant hard back in January; it begins to bloom in May, and will continue blooming freely until December. We gather flowers from it every week during the summer and autumn months, and I have on several occasions gathered over 100 flowers from it at one time. *Thomas Newton, Campsall Hall.* [Do you not withhold water for some time before cutting the plant back? Ed.]

ROSE MRS. GEORGE BRUAUT.—Through the kindness of Messrs. Cooling & Son, of Bath, I have received a bloom of this Rose, which is said to be a hybrid between Rugosa and Sombreuil. As far as I can see it has received but little from Rugosa. The foliage might suggest it, and Messrs. Cooling say it does; but the flower itself is a pure Tea, and deliciously fragrant. It is always difficult to judge a forced Rose; but while I have no doubt it will be seen in much better form, I very much question whether there will be much of the Japanese Rose in it. *Wild Rose.*

ARRANGEMENT OF HOT-WATER PIPES.—Mr. Watson does well to draw the attention of the readers of the *Gardeners' Chronicle* to the mismanagement of hot-water pipes. The plan he condemns of placing so many pipes in a body in any one part of the house, often under the stages, is an absurd arrangement, but when this method of fixing them is carried out in a vinery, it is almost worse there than in the plant-houses. In good-sized vineries—as, for instance, those which are three-quarter span in form, the ridge being, say, 14 feet high, and the width of the house 16 to 18 feet—it sometimes occurs that there are six rows of pipes to heat the house, or, if a larger one, eight rows. But where they are placed altogether, and in the front of the house, at a distance of from 2—3 feet from the front wall, and so that they rest in three rows, each one above the other, or four rows of pipes and the same number of rows one on the other, what can be the result of this arrangement? Why, the heat must, in the particular area above the pipes, be much greater than is good for the Vines, while the rest of the house is many degrees colder, simply for the want of a better distribution of the pipes. The Vines over the pipes are always much earlier in starting than those in any other part of the house—in fact, so much so oftentimes that two different methods of treatment in the same house would be an advantage. Many times I have seen the bunches of Grapes over the pipes ready for thinning while the bunches at the top of the house were not even in bloom. Under such conditions it is a wonder if the foliage over the pipes does not become infested with red-spider; indeed, it is seldom they do where the Vines are started at a time which obliges much tiring to be employed when they are in flower. Anyhow much more labour is necessary to prevent a spread of this pest where the heat is centred in one place than where the pipes are arranged in a more rational manner. Of course there are two sides to every question, and some persons may say this is the most convenient way when the vinery has to be used for a variety of purposes—the growing of plants as well as Grapes; but even in such case it is not necessary to cluster them all in one part, for surely means could be found to divide and so arrange that the heat would be equalised throughout the house. Where the house is intended for a vinery simply the pipes should be spread about the house and over the top of the border. The first pipe may rest on the wall-plate, assuming there is one. This pipe will act as a warmer to the air coming by the front light. The Vines are generally planted near to the front wall, say, 6 inches from it; the next pipe should be 2 feet from the first, and the remainder the same

distance apart. The pipes can be supported by light iron girders let into the front wall of the house and supported by pillars at the opposite side of the border. In this manner the heat is equalised over the house, and there is seldom any difference appreciable in the growth stages of the Vines, and not nearly so much risk of the foliage being attacked with red-spider. S.

—Without coming in contact with them one would hardly credit the ignorance of some gardeners concerning the essentials conducive to the welfare of the occupants of a house. The climatological essential is the most important item to be considered in indoor gardening, and Mr. Watson does well to call attention to it at p. 235. I must endorse his opinion with regard to the equal distribution of heat in a house, and in order to obtain this object it is necessary that the hot-water pipes should be distributed over the whole surface, and not confined, as is now generally the case. Piping now-a-days is comparatively cheap, and the cost incurred by the addition would repay itself if only by the saving of fuel. The generality of plants should rest in the winter time; but this cannot be when, in order to keep the frost and bitter winds out of another part of the house, the plants in the vicinity of the pipes are overheated. This is an evil which ought at once to be remedied, especially at an establishment as Kew, which is visited by gentlemen and gardeners of every grade and nationality, most of whom expect to find horticulture, as well as things botanical, carried out in a practical and systematic way. *F. Ashton.*

BASIC CINDER.—In answer to "A. G. B." in last week's issue of this journal, respecting basic cinder, its composition and adaptation to vegetative uses, we may say, in the first place, that its chemical composition varies largely, according to the (a) composition of the pig-iron, (b) the extent to which the oxidation of the iron is carried during the process, (c) the proportion and nature of basic addition made to the charge, together with that of the furnace lining worn away. The average composition, however, may be stated as follows:—Phosphoric acid, 13 to 20 per cent; lime, 40 to 50 per cent; magnesia, 4 to 6 per cent; oxide of manganese, 3 to 5 per cent; alumina, 2 per cent; about 14 per cent. oxides of iron, and 8 per cent. of silica. The favourable action of phosphoric acid in the economy of plant-life is well known, and one of the most important points connected with Basic slag is, that it contains no sulphuric acid, and therefore it can be used with great advantage instead of superphosphate for root-crops on soils where the "finger and toe" disease is prevalent. Dr. Wagner says—"The more than 200 of experiments on different soils and plants most exactly observed, have shown that the finely-powdered slag is not only in the highest degree active upon moor and meadow soils, but also upon ordinary arable and garden soils, producing exceptionally high increase in crops." Fair plant-growth results have been obtained upon chalky land, but the best returns have been obtained by using this manure on peaty, sandy, loamy, and poorly calcareous soils. In poor soil it seems to equal superphosphate in its action, as not only the phosphoric acid but also the lime and magnesia are absorbed by the plant. Mr. Percy C. Gilchrist says, "In looking carefully at the experimental evidence of the value of this manure it will be seen that the beneficial action of the slag, like that of superphosphate, is very much aided by using with it other manures to give the necessary nitrogen and potash salts required by the soil, such as dung, nitrate of soda, sulphate of ammonia, and sulphate of potash. I can hardly too strongly insist upon this point. From experiments made at Rothamsted with basic slag it was found that when this manure replaced superphosphate double the quantity was required, that it did not act so quickly as superphosphate, but was more lasting in its effects. It should therefore be very useful as a manure for Vine borders, Roses, and fruit trees; also for Onions, Potatoes, and root crops generally. *J. J. Willis, Harpenden.*

RAT'S-TAIL FERN.—In your Notices to Correspondents of February 25, "G. P." wants to know the name of the Rat's-tail Fern. Seeing his inquiries remain unanswered, I would state that I have heard the name applied to the following Fern, *Hymenolepis spicata*, Presl. (syn. *H. revoluta*, Kunze, syn. *Achrostichum spicatum*, Linn., from the Malayan Archipelago) fronds linear, lanceolate, smooth, more or less of the upper portion abruptly contracted and revolute, forming a fertile linear spike. Whether

the term is a general one or not I cannot say. It certainly has a very "rat's-tail" look about it, and is probably what "G. P." inquires about. *John Fielden, The Museum, York.*

SCOTLAND.

GLASGOW INTERNATIONAL EXHIBITION, 1888.

This Exhibition, like that of Manchester held last year, has the advantage of standing in grounds already laid out. Glasgow, with the experiences of the past, has been or will be, able, with the help of the civic authorities, to erect at the outskirts of the West End Park a building capacious enough for all exhibits. The greater part of the park will form part and parcel of the Exhibition, the Exhibition grounds covering an area of about 12 acres, and that part of the park in connection therewith about 48 acres more.

Kelvin Grove Park, barring "The Green," is the oldest of all the Glasgow parks, and it is only a ten minutes' run from the principal railway termini of the city; moreover, it is one of the best laid-out of the city parks, having special features favourable for landscape art. The walks and drives over its undulating surface will form a very pleasing promenade for visitors. The building itself is to be erected in the low grounds at the south-west corner abutting on the Dumbarton Road, which connects Partick with Glasgow. The Kelvin winds through the grounds, and although it is not so pellucid a stream as it once was, the sewage which at one time befouled it has been diverted by means of sewers, and carried beyond the city boundary. The committee have resolved to deepen the Kelvin stream opposite to the buildings, for the better accommodation of naval models and life-saving apparatus. There is to be a length of 1500 feet and a width of 90 feet secured for this purpose, which will be deepened to an average of about 6 feet, and doubtless this will form not the least of the special features of the Exhibition. The Glasgow University buildings, the bases of which are about 150 feet above the bed of the Kelvin, surmount the rising grounds between the river and the railed-off space, and are, as the committee in their prospectus say, "well adapted for the effective display of electric lighting and pyrotechnic illuminations, as well as for the enjoyment of musical promenades and other entertainments which it is intended to provide." The adjacent space to the west and north of the main building will be available for special departments, chief among which will be machinery; and those who wish to exhibit living products of horticulture can have sufficient space for designs from Park Grove Terrace northwards, and up to the base of the Museum. This is likely to form a very interesting display, the ground being every way suitable for the purpose. The classification of exhibits invited under the heading of horticulture and floriculture, comprise:—1, Ornamental trees, shrubs, Conifers, flowers, illustrations of, and materials used in floral designs, &c.; 2, Hothouses, conservatories, vineries and their equipment, including plants; 3, Garden implements, vases, flower-pots, &c.; 4, Borderings for walks and flower-beds, park-seats, chairs, garden statuary, fountains; 5, Rustic arbours, houses, chairs, bridges, &c.

ARBORETCULTURE.

1, Timber and trunks of trees, abnormal growths with specimens of barks, leaves, flowers and seeds, slip timber, shingles, laths, staves, wood for street paving, ornamental woods used in design and furniture, dye woods, preservation of timber, illustrations of planting and protecting forests. 2, Collections, illustrations, and descriptions of destructive insects.

Of course, to make these look effective in whole or in part, would require some design and some method of arrangement—in fact, they need not all be necessarily in or about one place. What, for instance, would be suitable for a group in the main building

might not be effective outside, and *vice versa*. With proper distribution, however, if horticulturists and arboriculturists will aid the scheme by sending their wares it is found an impetus is certain to be given that will be felt by all who are interested in gardening and forestry. That there is no want of money in the concern is already well known, upwards of a quarter of a million being already subscribed. However, most of our projected showing in Scotland has hitherto been either killed or made unsuccessful by the want of a little genius and foresight in catering; and by being niggardly, as in the case of Edinburgh, and remunerating decently only after the venture has begun to pay. If exhibitors of all kinds will come forward and do their duty, judging by the calibre of those gentlemen at the head of the affair, they are certain not to go unrewarded. The "Entertainment Committee" is anxious to provide such a variety of entertainment during the Exhibition over and above general exhibits as will draw the people in their tens of thousands. Apart altogether from other auxiliary displays it has been decided to hold at least two great horticultural shows—one about midsummer, and the other in the autumn, with the view of exhibiting such products as catch the public eye—one we take it to be encouraging plant growing in pots, and the other chiefly for a display of the more prominent fruits, extending over three or four days on each occasion. Some impetus certainly is required in the West of Scotland, tempting prizes now-a-days being conspicuous by their absence, and as we know it is useless to trust to exhibitors either at home or from a distance for mere honour and glory. A.

ing was by the daughter. After the examination I asked Mr. Moussempes if his cousin had any other occupation, and he replied that he had devoted his whole life to these subjects. "And where is his herbarium of the plants?" I asked, "Swept away as rubbish," he replied. "And the books would have gone the same way had I not secured them, and I should like for the honour of my departed cousin that the world knew of them, and the man who produced them. I have his likeness here you see, and I wish some journal would give a record of his works and his life." At this point Mr. Moussempes disappeared for a few minutes, and when he reappeared from a recess behind his shop, I observed he was covered with dust, but he held up a handful of mouldy-looking weather-stained sheets with the cover loose; these he placed beside me with the remark, "You may like to see this," and, indeed, I did, as it was *Theatrum Florum*, the first time I had seen it, and I was deeply interested in this ancient volume, published five years after our Parkinson's *Paradisus*. "Would he sell it?" I said. "No! I will sell none of these books," Peter Burr. February 28.

SOCIETIES.

NATIONAL CHRYSANTHEMUM.

A NUMEROUSLY attended meeting of the committee of this Society took place at Anderton's Hotel, Fleet Street, on Monday evening last, the President (E. Sanderson, Esq.) in the chair; and among those present were Messrs. W. K. Woodcock, T. B. Jague, J. G. Newsham, and T. Udale, who had attended earlier in the day as a deputation from Sheffield to arrange the details of the provincial show in that town on November 16 next. A hearty resolution of welcome to these gentlemen was passed by acclamation, which was ordered to be entered upon the minutes. Mr. Woodcock returned thanks, and stated that the proposed provincial show of the National Society was exciting a great deal of enthusiasm in the town, and that the guarantee fund was being so generously subscribed to that it would exceed the sum named in the first instance. The representatives of the Tooting and Wimbledon Societies were also present. The minutes of the last meeting having been read, which set forth that for the future the Gold Medal of the Society would be of the value of five guineas; the Silver-gilt Medal, 25s.; the Silver Medal, 16s. 6d.; and the Bronze Medal, 9s. 6d., and that no affiliated society should be allowed to have more than ten medals without a special vote of the committee—some correspondence was read from York and other places relative to the provincial show. Mr. Lazenby, the Secretary of the York Society, expressing a desire to have the provincial show of 1889 in that city. The Finchley and Derby Chrysanthemum Societies were admitted to affiliation, and four new members were elected. The report of the sub-committee appointed to carry out the arrangements of the provincial show at Sheffield was read, and it set forth among other particulars that as the medals of the National Society are so highly appreciated by amateurs, several would be offered at Sheffield, but successful exhibitors would have the option of taking cash instead, if they desired. The report was unanimously adopted. The schedule of prizes is not yet complete. The schedules of the September, November, and January exhibitions of the Society at the Royal Aquarium were then submitted by the sub-committee appointed to receive them. In the case of the September show the Dahlia classes have been revised, and some set apart for amateurs only. The schedule of prizes at the great show in November has been considerably revised, and those who stage groups of Chrysanthemums, arranged for effect can now add an edging of Ferns or foliaged plants, provided such edging does not exceed a foot in width beyond the space marked out for the group. Quite a new feature has been introduced in the form of a Challenge Trophy for competition by societies—the 1st prize, a Silver-gilt Medal and £10; the 2nd, a Silver Medal and £5, which are offered for twenty-four Chrysanthemums, twenty-four incurved, and twenty-four Japanese, and the blooms may be the production of one or more growers at the option of the society competing. The definition of amateur has also been enlarged, and there are classes for amateurs

who do not employ skilled labour, and also for those who employ but one gardener only. The class for a collection of Grapes has been thrown out, and one for three bunches of Gros Colmar substituted for it. The schedule was adopted, together with that for the January show, and the proceedings closed with hearty votes of thanks to the President, Vice-President, and Secretary, as this meeting concluded what is regarded as the winter session of the Society.

SCOTTISH HORTICULTURAL ASSOCIATION.

THE annual meeting of this Association was held on Tuesday March 6, at 5, St. Andrew Square, Edinburgh. There was a crowded attendance. Mr. D. P. Laird, President, occupied the chair. The eleventh annual report, which was read by the Secretary, Mr. Robertson Munro, stated that the Association had carried out its objects with such signal success that it might now be regarded as occupying a prominent position amongst British Horticultural Associations. During the year sixteen papers had been read, fourteen ordinary and one honorary member had been added to the roll, and fifty-three exhibits had been placed on the table by twenty-seven members. The financial statement showed a balance in hand of about £11. The office-bearers were then appointed as follows:—Hon. President, the Duke of Buccleuch; President, Mr. Alex. Mackinnon, Scone Palace, Perth; Vice-Presidents, Messrs. D. P. Laird and Robert Morrison, West Register Street; Secretary, Mr. Robertson Munro; Treasurer, Mr. A. D. Mackenzie; Council, Messrs. Bell, Morton Hall; Simpson, Rosebank Cemetery; Morris, Hay Lodge; Hugh Fraser, Leith Walk Nursery; and Chapman, Easter Duddingston Lodge. The Chairman moved that the Association instruct their Secretary to send a letter of congratulation to Professor Bayley Balfour on his recent appointment in Edinburgh University. Mr. Malcolm Dunn intimated that book prizes or certificates would be offered by the Council to assistant gardeners for essays on various subjects, a list of which was submitted. The members were shown a new seedling Rhododendron by Mr. M'Hattie, Newbattle, and a Clematis indivisa by Mr. Mackinnon, Melville Castle. The last mentioned exhibit was 11 feet 2 inches long, and when cut possessed 900 blooms.

FOREIGN CORRESPONDENCE.

BIARRITZ.

I LEFT London, snow lying thickly on the ground, and this was the case pretty generally along the line to Paris, which had its full share. At Bordeaux the snow was lying very thick; at Arcachon, from the top of the observatory, snow was to be seen all over the district. Dax was more favoured; there was a little here and there, which had disappeared by the morning. Whether the hot spring (158° Fahr.) had anything to do with the rapid disappearance of the snow was a question with me, as I walked some distance into the country and saw none. Soon after leaving Dax there was snow more or less, and at Bayonne there was a fairly good representation of a Scotch winter, and it has continued till this forenoon, when the wind changed, a little rain fell and the atmosphere, which was very cold, became moderately mild and the snow at Bayonne and Biarritz began to disappear, and if the thaw continues I may leave here by Thursday or Friday and get to the borders of Spain. Meantime, I have been hunting up other objects and amongst these at the Marquis de Folin's study I was introduced to the Bathysiphons (?) he has fished up from the briny deeps at depths of 600 metres. I next went to the shop of Mr. J. Moussempes, druggist, Biarritz, who placed before me three books in MS., by his cousin Pierre Thomas Duconrau, to me perfect marvels; and I would recommend all interested in literature who visit Biarritz to call and see these books. I hardly dare venture to describe them, as it would be impossible for me to do them justice; suffice to say that a greater exhibition of talent and industry I have never met with. The first volume is devoted to illustrations of the vegetable kingdom, the drawings perfect and the plants carefully and minutely dissected, nothing omitted, and these by thousands, crowded on the pages as if the artist had made up his mind to compress everything in the smallest compass without reducing. I turned over leaf after leaf and the further I went the greater was my astonishment. The next book I examined comprised birds, done in the same painstaking manner; and the third volume was devoted to fish, depicted with the same skill, and the same painstaking detail—all appeared to have been done from Nature, the colour-

THE WEATHER.

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MARCH 17. (AVERAGE OF FORTY-FOUR YEARS).

Mar. 11	42°·0	Mar. 15	42°·4
" 12	42°·1	" 16	42°·6
" 13	42°·2	" 17	42°·7
" 14	42°·3	Mean for the week ...	42°·3

THE PAST WEEK.

The following summary record of the weather for the week ending, February 27, is furnished from the Meteorological Office:—

"The weather has been fairer generally than that reported of late, although a good deal of cloud has prevailed in most districts.

"The temperature has continued below the mean in all parts of the kingdom, but at the end of the period the thermometer was rising briskly. Over Scotland the deficit has been 4°, and over Ireland between 4° and 6°; but in most parts of England it has been between 5° and 9°, and in 'England, S.,' as much as 10°. The highest of the maxima, which were generally recorded on March 5, ranged from 45° over the east and north of England to 53° in 'Ireland, S.' The lowest of the minima, which were registered on rather irregular rates, varied from 17° to 18° in Scotland, from 19° to 22° in Ireland, and from 18° to 24° over England.

"The rainfall has been very considerably less than the mean in all districts.

"Bright sunshine shows a decided increase on that recorded last week, the percentage of the possible amount of duration ranging from 21 in 'Ireland, N.,' and 22 in 'Scotland, E.,' to 37 in 'Scotland, W.,' and 40 in 'England, N.W.'"

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

Table with columns: DISTRICTS, TEMPERATURE (Above or below the Mean for the week ending March 5, ACCUMULATED), RAINFALL (More or less than the Mean for the Week), and BRIGHT SUNSHINE. Rows include Principal Wheat-producing Districts and Principal Grazing, &c., Districts.

Table with columns: DISTRICTS, RAINFALL, and BRIGHT SUNSHINE. Rows include Principal Wheat-producing Districts and Principal Grazing, &c., Districts.

autumn and winter. Much better let them suffer from too little water. We may say that heavily smoking the house with either Tobacco-leaf or paper causes discoloration of the leaf. The bud drooping complained of follows, most probably, the loss of foliage.

DRAWINGS OF INSECTS: S. H. We do not know where you could procure these. See Miss Ormerod's Methods of Insect Life.

DRY ROT: L. See Gardeners' Chronicle, November 13, 1886. "Prevention is better than cure." Free ventilation, and the use of timber soaked in chloride of zinc or sulphate of copper. We fear, when once the dry-rot gets established under such circumstances, there is no cure.

EUCARIS BEETLES: J. F. Your bulbs are swarming with the bulb or Eucaris mite. Burn all bulbs so affected; you can do nothing else.

MEDICINAL PLANTS: F. S. We are of opinion that these will not pay as an article of commerce, the demand being very limited. There are at present very few growing them, and if a number of persons grew them the competition would lead to such a reduction of profit that it would pay no one as a speculation. To grow medicinal plants for use is quite another thing. It is not possible to buy drugs of such excellent quality as could be grown, because such quantities of inferior quality are exported from Germany at fabulously low prices as to exclude really good articles for commerce. Thus, if really good belladonna or aconite root be wanted, you must grow it yourself. Henbane leaves, owing to the difficulty of growing the plant and the uncertainty of its appearance, even in the wild state, lead to the obtaining at present a remunerative price, but the continuance of this would of course depend on competition. We know of no work on the cultivation of medicinal plants. We refer you to a few papers in the Pharmaceutical Journal, i., p. 812; v., pp. 350, 448; vii., p. 1017; viii., pp. 30, 301; xii., p. 237, H.

NAMES OF FRUIT: L. Allegro. 1, King of the Pippins; 2, Claygate Pearmain, probably; but we cannot be sure, the specimens are so much bruised.—G. Phillips. Bruised beyond recognition.

NAMES OF PLANTS: A. Taylor. Cypripedium insigne.—T. Robertson. Struthiopteris germanica probably; send fertile frond.—G. W. D. Odontoglossum crispum—a poor form.—T. S. Dendrobium speciosum.—E. M. E. W. Phaius (No. 1) Wallichi, (No. 2) grandifolius; Francisca calycina. Azaleas we do not name.—W. A. F. 1, Cyrtodeira fulgida; 2, Pelleania Daveaniana; 3, Alocasia macrorrhiza. We do not undertake to name Rosas.

NITRATE OF SODA: F. S. This is not a good manure for the Pine-apple, as it tends to develop leaves and crown unduly, and to keep the ball of earth too moist, by its power of attracting moisture from the air. 2. We do not know what would be a suitable quantity per gallon of water, but it would be very small; the dressing for grass land being at about the rate of 3 cwt. per acre.

ORANGE: H. H. The fruit is probably a seedling variety from a bitter Orange; cannot be identified as a cultivated sort.

PETROLEUM OIL AND VINES: Leah. Yes, the oil would seriously injure, and perhaps kill them. There is an Emulsion of Petroleum sold by some nurserymen and horticultural sundriesmen which would do all that you require, and is harmless.

PLANTS IN CULTIVATION: G. L. Impossible to say. Say 5000 species, with many more varieties; 4000 flowering plants.

PRIMULAS: W. J. M. We have not seen a better selection of Primula sinensis hybrids than those you sent. We know that the firm which supplied the seeds from which they were raised pays great attention to the cultivation of the Primula.

SEQUIOIA, WELLINGTONIA: W. T. J. Wellingtonia is a garden name. The proper name is Sequoia gigantea.

"THE GARDENER": L. M. This periodical ceased to appear about the end of the year 1882.

MARKETS.

COVENT GARDEN, March 8.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. ED.]

No alteration. Market clear, with steady business. James Webber, Wholesale Apple Market.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with columns: s.d.s.d. and s.d.s.d. Lists prices for various plants like Aralia Sieboldi, Azaleas, Bouvardias, etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with columns: s.d.s.d. and s.d.s.d. Lists prices for various cut flowers like Acacia, Marguerites, Mignonette, etc.

* Orchid bloom in great variety, but the demand not very good.

NOTICES TO CORRESPONDENTS.

BOOKS: W. G. You can get the book from Bell & Sons, York Street, Covent Garden, London, W.C. CAMELLIA LEAVES FALLING: J. W. We frequently have Camellia leaves sent to us looking exactly as yours do. Everything may be right with the cultivation, except that perhaps too much water was afforded them on being housed. Doing this will cause a layer of cells to form in the leaf-stalks just beyond the point of natural severance from the shoot. The watery cells are loosely packed together, making the leaf-stalk weak at that point, and unable to bear the weight of the leaf—therefore its fall. The obvious remedy is to restore the balance between absorption by the roots and transpiration by the leaves; that is at the period of housing, and afterwards also, to give much less water at the roots, and to let the plants enjoy all the air and sun possible. Many greenhouse plants suffer from this undue watering in

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 2 columns: Fruit name and price. Includes Apples, Grapes, Kent Cobs, Lemons, Pears, Pine-apples, St. Michael, Strawberries.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 2 columns: Vegetable name and price. Includes Artichokes, Beans, Beet, Bruss. Sprouts, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Green Mint, Herbs, Leeks, Lettuce, Mushrooms, Mustard and Cress, Onions, Parsley, Potatoes, Kidney, Rhubarb, Seakale, Shallots, Spinach, Spruce, Tomatoes, Turnips.

SEEDS.

LONDON: March 7. — Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., state that there is now more business doing generally in farm seeds. With a continuance of the present favourable weather an exceedingly brisk demand would prevail. White Clover seed holders are now asking 2s. more money from the lowest point; other varieties keep steady. Perennial and Italian Ryegrasses move off at late rates. Sanfoin is getting scarcer; available stocks are now reduced to narrow limits. Spring Tares, both Konigsberg and Gores, sell freely on former terms. Hemp seed remains very firm. Canary seed shows no quotable change. Scarlet Runners are eagerly bought as soon as offered. White Runners also have a quick sale. There is rather more inquiry for Blue Peas.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended March 3:—Wheat, 30s. 2d.; Barley, 29s. 9d.; Oats, 15s. 10d. For the corresponding week in 1887:—Wheat, 32s. 9d.; Barley, 25s. 1d.; Oats, 16s. 2d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: March 7.—Quotations:—Savoys, 5s. to 12s. per tally; Cauliflowers, 7s. 6d. to 14s. do.; Seakale, 2s. 6d. to 3s. 6d. per sieve; Spinach, 2s. 6d. to 3s. 6d. do.; Broccoli, 3s. to 3s. 6d. do.; Brussels Sprouts, 5s. 6d. to 7s. do.; Turnip-tops, 3s. to 4s. per sack; Greens, 5s. to 6s. per dozen bunches; Turnips, 3s. 6d. to 4s. do.; Carrots, 2s. 6d. to 3s. do.; Rhubarb, 3s. to 5s. per dozen bundles; Celery, 10d. to 1s. 6d. per bundle; Cabbage Lettuces, 8d. to 1s. 6d. per dozen; Leeks, 2s. 6d. to 3s. do.; Beetroots, 6d. to 10d. do.; Endive, 2s. to 3s. do.; Horseradish, 1s. to 1s. 6d. per bundle; English Onions, 12s. to 15s. per cwt.; foreign do., 10s. to 13s. per bag of 110 lb.; English Apples, 4s. to 7s. per bushel; American Apples, 14s. to 22s. per barrel.

STRAFORD: March 6.—Quotations:—Savoys, 10s. to 12s. per tally; Greens, 4s. 6d. to 5s. loose; Paranspis, 6d. to 1s. per score; Mangels, 21s. to 25s. per ton; Swedes, 22s. to 25s. do.; Watercress, 6d. per dozen; Apples, 7s. to 8s. per bushel; Carrots, 3s. 6d. to 4s. per dozen bunches; Beetroots, 8d. to 9d. per dozen; Sprouts, 3s. 6d. to 4s. per bushel; Rhubarb, 2s. to 2s. 6d. per dozen; Celery, 1s. to 1s. 6d. per roll; Lettuce, 1s. to 1s. 3d. per dozen; herbs, 4s. per dozen bunches; salads, 2s. to 2s. 6d. per dozen.

POTATOS.

BOROUGH AND SPITALFIELDS: March 6.—Adequate supplies, and rather firm market for best sorts.—Quotations:—Regents, 70s. to 105s.; Magnum Bonums, 45s. to 105s.; English Rocks, 35s. to 70s. per ton.

SPITALFIELDS AND COLUMBIA: March 7.—Quotations:—Beauty of Hebron, 120s. to 140s.; Champignons, 50s. to 60s.; Victorias, 50s. to 70s.; Regents, 60s. to 90s.; Magnum Bonums, 45s. to 70s. per ton.

STRAFORD: March 6.—Quotations:—Scotch Regents, 80s. to 105s.; English do., 70s. to 80s.; Beauty of Hebron, 108s. to 120s.; Magnums, 45s. to 55s.; do., light land, 55s. to 75s. per ton.

NOTICE OF REMOVAL HORTICULTURAL SUNDRIES.

MISS J. SLAYMAKER, daughter of the late Mrs. Slaymaker, who for 43 years was Tenant of a Shop in the CENTRE AVENUE, COVENT GARDEN, begs to inform her Customers that she has

REMOVED HER BUSINESS OF FLORIST AND HORTICULTURAL SUNDRIES FROM COVENT GARDEN to 25, CATHERINE STREET, W.C.

(directly opposite the main entrance of Drury Lane Theatre), where the Business will be conducted on the same lines and with the same attention to the wishes of Customers and the Public as hitherto.

THE SHOWROOMS at the New Premises will be stocked with all the Latest Designs in ROUQUETS, WREATHS, CROSSES, BASKETS, &c., also all HORTICULTURAL and FLORIST REQUISITES. The favour of an early visit of inspection is respectfully solicited.

The New Premises are situated less than one minute's walk from the Flower Market and Central Avenue, Covent Garden Market, where Messrs. SLAYMAKER & Co. for nearly half a century have enjoyed the support which, with the increased facilities now at their command, they trust still to receive.

SLAYMAKER & CO.,

25, CATHERINE STREET, COVENT GARDEN, W.C.

CATALOGUES Free on application.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

Carriage and Breakage Free on £10 Orders. Half Carriage and Breakage Free on £5 Orders.
 Samples (carriage free) gratis, prices free on application.

From Messrs. WOOD & INGRAM, Huntingdon Nurseries.

"DEAR SIRs,—Having dealt with you for over a quarter of a century, we have much pleasure in giving our experience of your pots. In our opinion they are everything that can be wished for, being light and strong, of first-class colour, shape and finish. The special deep pot you make for our Clematis, from our own design, gives unqualified satisfaction to ourselves and all our customers. We want 25,000 for our first batch, and rely on your usual prompt and careful attention."

HORTICULTURAL PREPARATIONS

The Best and Most Effectual yet Introduced.

FOWLER'S LAWN SAND, for Destroying Daisies, Dandelions, Plantains, and other Weeds on Lawns, &c.; at the same time acting as a Fertiliser, and Improving the Growth and Colour of the Grass.
 Price, in Tins, 1s., 2s. 6d., and 5s.
 Kegs, 28 lb., 8s.; 56 lb., 16s.; 112 lb., 30s.

GARDENERS' INSECTICIDE, for Destroying all the various Insects, Blights and Mildews infesting Plants and Trees. It is easily applied, either by Dipping, Syringing, Spraying, or as a Winter-dressing. Does not require cleansing off with water; will not stain or injure the most delicate Flower, Fruit, or foliage.
 In Jars, 1s. 6d., 3s., 5s. 6d. and 10s. each.
 In Kegs, 28 lb., 21s.; 56 lb., 42s.; 112 lb., 84s. each.

FOWLER'S MEALY-BUG DESTROYER, for the Special Eradication of this most troublesome of Storehouse Plant Pests. It is easily applied, either with a small brush or vaporiser; is instant destruction to both Insect and Ova, and does not stain or injure the Foliage.
 In Bottles, 1s., 2s. 6d., 5s., and 10s.
 Half-gallon, 21s.; One Gallon, 42s. each.

POOLEY'S WORM DESTROYER, for Eradicating every kind of Worm from the Roots of Large Specimen Plants, Pots, Lawns, &c. It is easily and cheaply applied, and will not harm the most delicate plant.
 In Bottles, 1s., 2s. 6d., 7s., and 12s. 6d. each.

EWING'S MILDEW COMPOSITION, for the Prevention or Destruction of Mildew on all Plants.
 In Bottles, 1s. 6d. and 3s. each.

CORRY, SOPER, FOWLER & CO. (LIMITED), SOLE MANUFACTURERS, LONDON.
 To be had from all Seedsmen and Florists throughout the Kingdom.

BEESEON'S MANURE.—The Best and Cheapest Fertiliser for all purposes. Write for Circular containing the Leading Gardeners' and Market Growers' Reports. Sold in Tins, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each, or 1 cwt. Bags, sealed, 13s. By all Seedsmen, or apply direct to **W. H. BEESEON, Carbrook Bone Mills, Sheffield.**

To Market Gardeners, &c.
SULPHATE OF AMMONIA. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to The MANAGER, Sheffield Gas Company, Sheffield.

BELFAST.

Weeks's PATENT DUPLEX TUBULAR

Is the only Boiler that can be made to yield a revenue by producing Lime with the same fire that works the apparatus.

The same Boilers at Wilton House Gardens have now been in operation nearly 20 years, and during this period a saving of one-fourth of fuel has been effected by the admixture of chalk, which is thus converted into lime and becomes saleable for building or garden purposes.

The saving of labour is equally as marked as the saving of fuel.

Full particulars post-free on application,

WANTED, a young LADY, for a Florist's Shop; well up in Wreaths, Bouquets, &c.; to live in the house. State experience and wages expected to JOHN CHARLTON, 37, The Paulties, Tunbridge Wells.

WANT PLACES.

NOTICE TO ADVERTISESES.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; in all such cases a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE ORDER.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER AND CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

Gardeners, Bailiffs, &c.
JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—JOHN LAING AND SONS, The Nurseries, Forest Hill, S.E.

WANTED, a GARDENER!!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—R. B. LAIRD AND SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.
S—JOHN DOWNIE (of the late firm of Downie & Laird), Seedsman, 141, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

LANDSCAPE GARDENING.—A thorough practical man is open to an engagement. Has had extensive experience in carrying out works of every description in connection with the above profession, and Estate Improvements generally.—Address, for references, &c., W. DINNES, 6, Abington Square, Northampton.

ESTATE MANAGER, BAILIFF, or HEAD GARDENER.—A GENTLEMAN highly recommends a married Man, who has been Managing an Estate, Home Farm, and Gardens for him.—B. ST. JOHN ACKERS, Esq., Huntley Manor, Gloucester.

NURSERY MANAGER.—Mr. JAMES COLE being about to terminate his Engagements with Messrs. Ireland & Thomson, with whom he has been for the past seven and a half years, will be glad to hear from any first-class house requiring his services.—New Golden Acre Nursery, Granton Road, Edinburgh.

GARDENER (HEAD).—Married; no family; thoroughly practical in all branches, good orchid grower. Can have the highest recommendation.—N. T., Fairland Hill, near Chilton, Bristol.

GARDENER (HEAD).—A GENTLEMAN wishes to recommend a Head Gardener. Fully experienced in all branches.—Rev. E. B. BOWMAN, Tidcombe Vicarage, Marlborough, Wilts.

GARDENER (HEAD).—Age 39, married, no family; excellent references. Well-versed in Forcing, Pleasure Grounds, Kitchen Gardening, and General Management of Large Estates.—GEO. MARSHALL, Magnolia Cottage, Streatham, S.W.

GARDENER (HEAD), where two or three are kept; age 29, single.—J. AMY, Gardener to the Hon. Mrs. Elliot Yorke, Hamble Cliff, Southampton, can with confidence recommend his Foreman, G. Dovey, as above. Disengaged by the end of March.

GARDENER (HEAD), age 32; single.—Mr. T. ROBINSON, Coopers' Hill Gardens, Englefield Green, Staines, can with confidence recommend his Foreman, W. Wheeler, to any Lady or Gentleman requiring a good practical man.

GARDENER (HEAD).—Age 33, married, no family; thoroughly practical in all branches. Twenty years' experience, nearly four years as Head in last situation. Can have good character.—W. CAMPIN, 8, Crown Terrace, Richmond, Surrey.

GARDENER (HEAD), where four or more are kept.—Age 32; eighteen years' experience in Early and Late Forcing of Fruit, Flowers, and Vegetables; also Stove and Greenhouse Plants, Flower and Kitchen Gardening. Excellent character and testimonials. Charles Arthur Tolley.—Apply, Mr. CYPHER, Exotic Nursery, Cheltenham.

GARDENER (HEAD); age 30.—A. AGER, Head Gardener to J. B. Hankey, Esq., Fetcham Park, Leatherhead, will be pleased to recommend George Cooper as above. He has served him as Foreman for three and a half years; also previous good references for the same.—Address as above.

GARDENER (HEAD); no incumbance.—Mr. W. BISHOP, late Gardener to the late Sir E. Jodrell, Bart., and many years at Bylaugh Park, will be pleased to treat with any Lady or Gentleman requiring the services of a first-class all-round Gardener.—HEAD GARDENER, The Grove, Teddington; or, HEAD GARDENER, Wesley Hall, Bury St. Edmunds.

GARDENER (HEAD); age 33, married, no family.—W. J. IRELAND, late of Nostell Priory, and previously with the Marquis of Headfort, is open for re-engagement. Thoroughly conversant with all matters relative to Horticulture. Protestant. Strong and healthy, and not afraid of exerting himself. Left at own request. Testimonials of the highest order for character and ability.—14A, Upper Winchester Road, Catford, S.E.

GARDENER (HEAD); age 36; abstainer.—General NEWDEGATE, of Arbury Hall, Nuneaton, Warwickshire, will be pleased to recommend his Head Gardener, C. Marshall, to any Lady, Nobleman, or Gentleman requiring the service of a thoroughly practical man. Four years in present situation; six and a half years previous as Head. Leaving entirely owing to an alteration in the establishment.—Please address as above.

GARDENER (HEAD WORKING).—No young children. Twenty years' experience. Wife could assist in Laundry if required. Good character.—J. M., 36, Pasture Lane, Clayton, Bradford.

GARDENER (HEAD WORKING).—Age 34, married; thoroughly experienced in all branches of Gardening. Four years' good character.—GEORGE MESSENGER, Meadow Road, Longton, Essex.

GARDENER (HEAD WORKING).—Experienced in all branches. North or South. Six and a half years in present and nine in last situation.—GARDENER, The Manor House, Colliers Wood, Lower Tooting, S.W.

GARDENER (HEAD WORKING), or where help is given.—No incumbance. Thoroughly experienced in all branches. Wife Plain Cook, or any place of trust.—G. L., 45, Castle Place, Dover.

GARDENER (HEAD WORKING); age 38, married, one son.—The Advertiser begs to offer his services to any Lady or Gentleman requiring a thorough good practical all-round Gardener. Twenty years' experience. Highly recommended.—L. Gardeners' Chronicle Office, 41, Wellington Street, Strand, W.C.

GARDENER (HEAD WORKING); age 28.—Mr. LINDSEY will be glad to recommend his Foreman, Frederick Kerr, as above. Well experienced in Fruit Growing and Forcing, Plant Growing, Cut Flower Decoration, and the General Routine of good outdoor Gardening. Four years' good character.—The Gardens, Huntroyde Park, Burnley, Lancs.

GARDENER (HEAD WORKING), where not less than three are kept; age 25.—G. GOLDSMITH, The Gardens, Flore House, Wealdon, will be pleased to recommend Alfred Nightingale to any Lady or Gentleman requiring a thoroughly energetic man. Has lived with him two and a half years. Seven years' good character from present employer.

GARDENER (HEAD WORKING, or good SINGLE-HANDED);—Six years in one of the best gardens in Kent. Excellent testimonials.—M., Rev. S. W. D. Fox, St. Paul's Vicarage, Maidstone.

GARDENER (HEAD WORKING, where two or three are kept, or SINGLE-HANDED).—Fourteen years' practical experience in all its branches.—J. LUFF, 149, Brandon Street, Leicester.

GARDENER (HEAD WORKING, or good SINGLE-HANDED).—Age 35, married, no family; thorough practical experience—good all round. No objection to Late Management. Total abstainer. Undeniable character.—F. M., 44, Paradise Road, Clapham Road, S.W.

GARDENER (HEAD, or SINGLE-HANDED).—Twenty years in last situation. Thoroughly experienced in Stove and Greenhouse Plants, Vines, Melons, Cucumbers, Ferns, Flower and Kitchen Garden. Exceptional references. Abstainer. Preferably in neighbourhood.—S. H., Providence Cottage, High Cross Lane, Tottenham, London.

GARDENER (SINGLE-HANDED), or good SECOND.—Age 28, single; good experience Inside and Out. Good references.—E. HICKS, 2, Railway Square, Chelmsford, Essex.

GARDENER (SINGLE-HANDED, or UNDER).—Age 25, single; experienced Inside and Out. Good references. Abstainer.—F. P., 2, Duke Street, Deal.

GARDENER (SECOND).—Age 25; eight and a half years in present situation.—R. KESSELL, Carnation Gardens, St. Columb, Cornwall.

GARDENER (SECOND), or under a good man.—Age 21; three years in present situation.—G. P., 6, Chestnut Cottages, East Finchley.

GARDENER (SECOND).—Age 26, married, no family; ten years' experience; seven and a half years' good character. Abstainer.—G. PLUMB, Stratford Road, Hendon, N.W.

GARDENER (SECOND); age 24.—T. PLEDGER, Gardener to Rev. E. W. Northey, Woodcote House, Epsom, will be pleased to recommend Walter Fletcher as Second Gardener or under a first-class Foreman. He has lived on this estate two and a half years.

GARDENER (SECOND OR UNDER).—Age 24; nine years' experience. Inside and Out. Can be well recommended.—**J. CRACKNELL**, 58, Graveyue Road, Lower Tooting, S.W.

CARMAN, to a Nurseryman.—**G. WIGLEY**, 9, Doncaster Houses, Ossulton Street, London, N.W.

HOLLOWAY'S PILLS.—Weak Stomach.—

The wisest cannot enumerate one quarter of the distressing symptoms arising from imperfect or disordered digestion, all of which can be relieved by these admirable Pills. They remove any bitter taste from the mouth, flatulency, and constipation. Holloway's Pills rouse the stomach, liver, and every other organ, thereby bringing digestion to that healthy tone which fully enables it to convert all we eat and drink to the nourishment of our bodies. Hence these Pills are the surest strengtheners and the safest restoratives in nervousness, wasting, and chronic debility. Holloway's Pills are infallible remedies for impaired appetite, cravatations, and a multitude of other disagreeable symptoms which render the lives of thousands miserable indeed. These Pills are approved by all classes.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—

HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,

THE KING OF THE BELGIANS.

The Late EMPEROR OF THE FRENCH. The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1866,

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

SILENS MESSOR MOWER, with Improved Steel Chains and Handles.

SINGLE-HANDED LAWN MOWER.

To cut	can be worked by	Price.
To cut 6 in.	a Lady	£1 15 0

W. H. LASCELLES AND CO., HORTICULTURAL BUILDERS, 121, BUNHILL ROW, LONDON, E.C. Plans and Estimates Free. See large Advertisement, March 3, p. 232.

FRIDAY NEXT, MARCH 23.

ONCIDIUM SPLENDIDUM, True.

For many years past we have tried to rediscover the habitat of this most superb *Oncidium*, and have now succeeded.

The plant is exceedingly rare in its native country, and every piece received will be offered for **SALE BY AUCTION**, by **MESSRS. PROTHEROE & MORRIS**, at their Rooms, 67 and 68, Cheapside, London, E.C., on **FRIDAY NEXT**, March 23, at half-past 12 o'clock precisely.

The importation is simply grand; the masses have great thick leaves and enormous spikes and bulbs, one mass especially being altogether unique.

The flower of *Oncidium splendidum* is similar to *Oncidium tigrinum*, but more chaste and lovely. The plant, however, resembles more *O. microchilum*, from which it varies, however, by its far larger, blunt-pointed bulbs and great thick spikes, on which the flower-seats appear wide apart. (See dried flowers and spikes.)

For description of flower see *Gardeners' Chronicle* for January 28 last, p. 107:—"In 1871 we had occasion to write on this species; it was rare, and still remains so. Our original figure, taken from a plant of Lord Londesborough's, almost exactly reproduces the flower before us. The sepals and petals are recurved, undulate, pale yellow, with broad, chestnut-brown blotches. The lip is clear canary-yellow; the column is thick and short, and furnished on either side, at the top, with an ear-shaped process, white, with a few purplish spots, and greatly resembling the head-dress such as many of the Dutch or Flemish ladies of Rembrandt's time affected."

This *Oncidium* should have a sunny position in the *Cattleya*-house.

F. SANDER & CO.

CYPRIPEDIUM ROTHSCHILDIANUM.

THIS MOST GROTESQUE, EXTRAORDINARY, AND MAGNIFICENT
NEW CYPRIPEDIUM, FROM NEW GUINEA,

THURSDAY NEXT.—(Sale No. 7645.)

VANDA AMESIANA,
VANDA CÆRULEA,
CYMBIDIUM EBURNEUM.

MR. J. C. STEVENS will **SELL** by **AUCTION**, at his Great Rooms, 33, King Street, Covent Garden, W.C., on **THURSDAY NEXT**, March 22, at half-past 12 o'clock precisely, by order of Messrs. HUGH Low & Co., fine imported plants, in the best possible condition, of the rare and lovely **VANDA AMESIANA**, of which one plant only has been imported previous to the arrival of the plants now offered. **VANDA AMESIANA** may be classed amongst the very finest Orchids introduced in recent years; habit dwarf and compact, something in the style of *Aërides* affine, flowering with the greatest profusion, producing on the spike twelve or more flowers, large as those of *Vanda* Dennisiana, creamy-white, with a rich rosy-blue, and emitting a most delicious aromatic perfume. The original plant, which bloomed in the Clapton Nursery, made as much display as would *Phalænopsis Portei*. It is fully described by Professor Reichenbach, in the *Gardeners' Chronicle*, June 11, 1887, p. 764, also well figured in the *Orchid Album*, August 1887.

At the same time will be offered a splendid lot of imported plants of **VANDA CÆRULEA**, **CYMBIDIUM EBURNEUM**, **C. MASTERSII**, **DENDROBIUM BENSONIÆ**, **D. CREPIDATUM**, **D. CRASSINODE**, **D. CRETACEUM**, **D. DALHOUSIANUM**, **D. FALCONERI**, **SACCOLABIUM ILLUSTRÆ**, **S. CÆLESTÆ**, and other Choice ORCHIDS.

On view morning of Sale, and Catalogues had.

EUONYMUS.—20,000: all nice bushy well grown specimens, 9 to 30 inches, 15s. to 47 per 100; about 150 large ones, 3s. 6d. to 5s. each.
J. J. CLARK, Goldstone Farm, West Brighton.

MYATT'S ASHLEAF KIDNEY POTATOS, 12 Tons at 70s., at Aberdeen. Excellent change for South.—Apply, **BRUCE,** Seedsman, Aberdeen.

SHARPE'S NEW PEAS

SHARPE'S VICTORY.

First-class Certificate R.H.S., 1886. This magnificent variety surpasses everything we have ever seen. The habit of the plant is vigorous and much branched. Pods produced in pairs, occasionally three together, well filled with large Peas (ten to eleven), of extra fine flavour, and deep green colour when cooked. Height 2 feet.

Price, 3s. 6d. per Packet.

SHARPE'S QUEEN.

A grand Blue Marrow. Height 2 feet. Pods large, deep green, with large, green, deliciously-flavoured Peas. It is so continuous a cropper that a constant supply may be maintained by it alone after the first crop is ready.

Price, 3s. per Pint Packet.
1s. 6d. per Half-pint Packet.

SHARPE'S TRIUMPH.

An improved Stratagon, and the finest Pea for Market Gardeners; is a Blue, Wrinkled Marrow Pea, of exquisite flavour. Pods large and well filled. Height 2 to 3 feet. On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod.

A. C. WILKIN, Esq., *Tiptree, Kelvedon (a large Grower of Peas for Market)*, says:—"Sharpe's Triumph is a model and grand pattern of a Pea, about 2½ feet high, loaded with pods of a very fine size, dark green coloured, and Peas of a rich and delicious quality."

Price, 1s. 6d. per Pint Packet.
1s. per Half-pint Packet.

SHARPE'S PARAGON.

An improved Telephone, and a hardy, early, prolific Blue Marrow.

Price, 2s. 6d. per Quart,
1s. 6d. per Pint.

"THE DANIELS" Is the coming POTATO.

A cross between the White Elephant and Magnum Bonum, having the unexcelled qualities of both. Ready to lift same time as White Elephant. An immense cropper, and of splendid table quality. All Potato growers should try it.

Price per peck, 3s. 6d.; per bushel, 12s. 6d.;
per sack, 30s.

From Mr. J. ERR, *Broom Park, Cleobury Mortimer, Oct. 29*:—"The seed Potatoes, **The Daniels**, I bought of you last spring have turned out remarkably well in quantity as well as quality; I had 286 lb. from 7 lb.; not one diseased."

From Mr. E. PITT, *Ventnor, I.W.*:—"From 2 lb. of your new Potato, **The Daniels**, I have raised 213 lb., of splendid quality."

A CHANGE OF SEED ALWAYS PAYS.

Before ordering your supply send for **Daniels' Illustrated Potato Catalogue**, containing valuable hints on the Potato, with descriptions of nearly 200 kinds, and the latest Novelties. Gratis and Post-free to all applicants.

S. SHEPPERSON,

FLORIST and SEEDSMAN,
**PROSPECT HOUSE, BELPER,
DERBYSHIRE,**

Begs to inform the readers of this Paper that he is prepared to execute orders for the following plants, all of which are of the very finest possible strains that money can buy. They have all been grown on the Derbyshire Hills, and are therefore very hardy, and warranted to succeed and bloom well. All carriage free for cash with order.

*DESCRIPTIVE LIST of Florist Flowers,
Ad. stamps, or free to customers.*

PANSIES.—A great specialty Five Silver Cups and other Prizes awarded during 1887, probably the best collection in England; the cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, twelve for 3s., twenty-five for 5s. 6d., Carriage free for Postal Order.

FANCY PANSIES.—Unnamed, six for 1s., twelve for 1s. 6d., twenty-five for 2s. 6d., Postal Order. All different and first-class sorts, free.

CHRYSANTHEMUMS.—Great special culture, the best and most distinct varieties only, of large-flowered, incurved, reflexed, early and late bloomers, pompons, Japanese, &c., including many grand new varieties by the best English, Continental, and American raisers. Twelve distinct varieties, named, well rooted plants, for 2s.; twenty-four for 3s. 6d., free.

GRAND NEW CHRYSANTHEMUMS.—The cream only of the new varieties of 1886 and 1887. Six for 2s., twelve for 3s. 6d., named distinct varieties.

HOLLYHOCKS (Double).—Chaters' very finest and most select strain. Twelve varieties for 2s. 6d., six for 1s. 6d.; six extra strong for 2s., Postal Order, free.

CANTERBURY BELLS.—Grand new colours and new forms. Double and single Telescope, Candlabrum, and other varieties. Twelve good plants, to bloom well, for 1s.; twelve extra strong for 1s. 6d., Postal Order, free.

PURE SNOW-WHITE AURICULA.—One of the most beautiful hardy spring flowering plants in cultivation. Two for 1s., free.

AURICULAS.—A really grand strain of this deliciously scented old-fashioned favourite flower, including Turner's Alpines, Dean's new faced varieties, Dew-berry's Giant, and other really fine sorts. Good plants, that will bloom well this spring, three for 1s., six for 1s. 6d., twelve for 3s., all free.

POLYANTHUS.—Finest strain grown, fine large trusses and blooms, and splendid colours. Cannot be surpassed. Twelve for 1s., twenty-six for 2s., 100 for 7s., free. All good blooming plants.

POLYANTHUS and PRIMROSE.—Jack-in-the-Green, Hesse-in-hose, and other rare and curious forms unnamed. Six distinct sorts for 1s. 6d., twelve for 2s. 6d., free.

THE NEW DOUBLE SCARLET GEUM.—Quite hardy. Free bloomer. Grand for cutting or decoration. Twelve for 1s., twenty-five for 2s., Postal Order, free.

CARNATIONS, PICOTEEES, and CLOVES.—Strong plants, from finest low flowers only, including many new sorts. Will give a mass of bloom. Twelve beautiful varieties for 2s. 6d., six for 1s. 6d., free.

SCABIOSA (Double).—A really fine hardy plant for garden decoration or cut flowers. Many fine colours. 1s. per dozen, free.

PRIMULA CASHMIRIANA.—Splendid hardy mauve-coloured spring flowering plant. Three for 1s., free.

COLLECTION of twelve HARDY BORDER PLANTS, distinct and useful for decoration and cutting purposes, for 2s., free.

WALLFLOWERS.—Double German, Cranford Beauty, Ware's dark red, and Kershaw's bright red. 1s. per dozen, free.

FOXGLOVES.—Gloxinia-flowered, Dean's grand new large spotted varieties, very fine, twelve for 1s. 6d., six for 1s., free.

ALSO the FOLLOWING FREE BLOOMING HARDY PLANTS: should be in every garden; all at 1s. per dozen, free:—*Pure white Thrift, fine edging and spring flower; Malva moschata alba and rosea, beautiful pure white and rose, blooms all summer; Sweet Williams, the finest dark and giant Auricula-cyclid; Arabis alba, white spring-flowering plant, beautiful variegated foliage.*

STRAWBERRY PLANTS.—Selected crowns, transplanted. Black Prince Improved, British Queen, Alpha, Pauline, Sabreur, Vis-Countess H. de Thury, Duke of Edinburgh, King of the Earlys, and other extra sorts. 3s. per 100, free. Also the *Captain (Laxton's)*, twenty for 1s., free.

S. SHEPPERSON,
Florist and Seedsman,
**PROSPECT HOUSE, BELPER,
DERBYSHIRE.**

WEBBS

"JUBILEE" TOMATO

Per packet, 1s. 6d. and 2s. 6d. post-free.

From Mr. CRAWFORD, *The Gardens, Coddington Hall.*

"I exhibited a dish of Tomatoes 'Webbs' Jubilee' at Grantham, and secured first place. I showed the same dish at Leicester, in competition with twelve others, and was again victorious. It was the handsomest and most even dish of Tomatoes I had ever seen exhibited. Its cropping qualities and flavour are as good as its outward appearance."

WEBBS' EMPEROR CABBAGE.

Lord DERBY's Gardener says:—"Webbs' Emperor was grown with four other sorts, and was considered the best of the lot."

Per Packet, 6d. and 1s. post-free.

WEBBS' MAMMOTH RED CELERY.

Mr. J. OWEN says:—"I gained 1st and 2nd Prizes with your Mammoth Red Celery at our show."

Per Packet, 6d. and 1s. post-free.

WEBBS CRITERION LETTUCE.

Mr. J. MUIR says:—"Your Criterion Lettuce is a beauty—the best of all."

Per Packet, 1s. post-free.

WEBBS' MAY QUEEN BROCCOLI.

Mr. F. ROBERTS (Prestwood Gardens) says:—"I consider it the best winter variety yet introduced."

Per Packet, 1s. 6d., post-free.

WEBBS' BANBURY ONION.

Mr. J. MUIR says:—"Webbs' Banbury is the best for the main crop, and none can equal it for exhibition."

Per Packet, 6d., per Ounce, 1s., post-free.

WEBBS' MATCHLESS B. SPROUTS.

Mr. W. IGGULDEN says:—"Webbs' Matchless proves to be of great merit, producing an abundance of sprouts."

Per Packet, 6d. and 1s. post-free.

WEBBS' WORDSLEY WONDER PEA.

THE GARDEN says:—"This Pea merits all that can be said in its favour."

Per Quart, 3s., post-free.

WEBBS' NEW POTATO 1888

"STOURBRIDGE GLORY."

This splendid main crop Kidney is a seedling from Woodstock Kidney, and is sure to become a general favourite.

6s. per Peck of 14 lbs.

Illustrated Catalogue, 1s. Abridged Edition Gratis.

THE QUEEN'S SEEDSMEN,

WORDSLEY, STOURBRIDGE.

WRENCH'S

SPECIALTIES of the SEASON.

CALCEOLARIA.

Wrench's Splendid Strain.

Per Packet, 1s. and 2s. 6d.

CINERARIA.

Wrench's Splendid Strain.

Per Packet, 1s. and 2s. 6d.

HEARTSEASE.

Wrench's Choice Mixed

From English named varieties.

Per Packet, 6d. and 1s.

MARIGOLD.

Wrench's Extra Selected French.

Per Packet, 3d. and 6d.

PRIMULAS.

Wrench's Splendid Strains.

WRENCH'S SINENSIS FIMBRIATA RUBRA,

Per Packet, 1s. and 2s. 6d.

WRENCH'S SINENSIS FIMBRIATA ALBA,

Per Packet, 1s. and 2s. 6d.

WRENCH'S SINENSIS FIMBRIATA, Mixed,

Per Packet, 1s. and 2s. 6d.

WRENCH'S SINENSIS FIMBRIATA, Chiswick Red,

Per Packet, 1s. and 2s. 6d.

WALLFLOWER.

Wrench's Extra Dark Blood.

Covent Garden strain.

Per Packet, 3d. and 6d.

BEAN.

Wrench's Gigantic Runner.

Pod perfectly straight, and of extraordinary length. Unrivalled for exhibition purposes. Tender and delicious. Proved last season to be unequalled.

Per Pint, 3s.; per Quart, 5s.

BROCCOLI.

Snow's Winter White.

A perfect stock of this unique variety.

Per Packet, 1s.

BRUSSELS SPROUTS.

Wrench's King of the Market.

The largest, most prolific, and most delicate flavoured of all.

Per Ounce, 1s.

CABBAGE.

Wrench's New Dwarf, The Pigmy.

The earliest and dwarfest variety in cultivation. Admirable for private gardens. Per Packet, 1s.

CARROT.

Wrench's New Main Crop.

This splendid intermediate variety is somewhat longer than Nantes, and thicker at the shoulder, producing an enormous weight per acre.

Per Ounce, 1s., less by the pound.

LEE.

The Lyon.

A regular prize-taker.

Per Ounce, 1s. 6d.

PARSLEY.

Wrench's Champion.

The finest stock in the world.

Per Ounce, 6d.

A COVERED LILY BED.

THERE is, perhaps, no class of hardy plants which attracts the attention and tries the skill of amateur gardeners more than Lilies. Many complain that they know neither what kinds to grow, nor how to grow them; and I lately noticed an inquiry in a gardening journal—How can choice Lilies be grown in a cold part of England and on unfavourable soil? Whatever may be the capabilities of the climate and soil in any English county, there will everywhere be some Lilies which fail out-of-doors in that place, but which a covered bed, without any artificial heat, will bring within the range of practical gardening. Such a bed in my garden in Cheshire has proved a great success, and I wish my experience in this matter to be of use to as many gardeners as possible. The composition of the bed is of greater importance than the mode of covering it. I dug out a space 18 feet long and 12 feet wide, to a depth of 4 feet, the length stretching north and south, and secured good drainage at the bottom, laying it with a few inches of brick rubbish. The best staple of soil for the Lilies I wished to grow is peat, of which I used seven or eight loads, with about half as much good fibrous loam, adding leaf-mould, and a few barrowloads of finely broken stone, to keep the soil open. The strength of the soil is graduated from four-fifths peat at one end to nearly half loam at the other. It is covered by a double span frame, made of twelve ordinary pit lights, which rest upon brick walls standing 5 feet out of the ground outside, and 6 feet inside where the soil is left about a foot lower than the outer level to give more head-room. The outside height of 5 feet allows the lights to be easily drawn off and on so as to give the bed the full benefit of air, and of warm spring rains. As much ventilation as possible is given just above the ground line at the sides, by sliding wooden shutters. The door is at the centre of the south end, from which there is a narrow path through the middle of the bed. The lights must be made to bolt, as I learnt by experience, having had all

mine once blown off by a westerly gale. The total cost of this frame was something less than £15. The bed when once planted causes no further expense, either for cultivation or maintenance. Many things may be grown in it besides Lilies, especially Christmas Roses. I have about twenty plants of the variety *maxims* against the back wall, each of the plants giving during three months from the end of October an average of fifty flowers as large as any I ever saw.

But to return to Lilies, which in this bed get the benefit of shelter from wet in winter, from frosty nights in spring, and from burning sun when in flower, for at that time I paint the glass with lime and butter-milk. I will speak chiefly of those which fail with me outside. *L. Humboldtii* is the most conspicuous success. It produces heads of from twenty to fifty buds, but it is better to take off the top of the spike at an early stage, leaving about half the buds; in this way the flowers of those left become much finer. *L. Washingtonianum*, both the type and the distinct and beautiful variety *rubescens*, succeed admirably; so does *L. Parryi*, which ripens seed in abundance, the seed coming up where it falls, and making flowering bulbs in about three years. *L. Hansonii*, though hardy enough, is so early as to get its buds injured by frost outside, but succeeds well under shelter, flowering early in June. *L. Brownii*, too, seems quite contented; a bulb of it, after producing two flowers on one stalk for two seasons, failed to make any appearance at all the third year, but the next year it produced three fine stalks, each with two flowers. This habit of Lilies is well known to observant gardeners: the bulb occasionally collects strength and makes growth all underground for a season. I have found some terrestrial Orchids do the same. It is better not to be too curious about their condition under these circumstances, as the bulbs are doing their duty, and hate to be disturbed. Some of the varieties of *Lilium longilorum* do very well in this same frame; they live out-of-doors with me, but rarely flower. I am surprised to find that *L. auratum* and *L. speciosum* deteriorate and die out in two or three years under glass, as they do in the open border. *L. Kramerii* fails. I think it wants greater warmth: the same is the case with *L. Neilgherrense* and *L. Wallichianum*. The Cheshire summer is neither hot enough nor long enough for them. *L. Batemanni* and the varieties of *L. elegans* are not very good, but do better than outside. *L. giganteum* requires a light to be removed that it may grow through the top, hence, as it does well without shelter, I no longer admit it. My frame of course requires an occasional smoking, especially as there are Macartney and Banksian Roses on the inner walls. A light dressing in spring renovates the surface of the beds, and helps the seedlings. All the bulbs, when planted, are surrounded with two or three handfuls of coarse river sand or some equivalent, and I often mix bone-dust with the soil below them, which seems to do good.

For the information of those who may be beginning to cultivate Lilies I make a brief mention of a few kinds which do well in the open ground in my indifferent climate. I grow many kinds in the mixed borders, where the clay soil is more or less modified by lighter material, and many in the middle of raised Daffodil beds, composed of good sandy loam. All the Lilies of *L. pardalinum*, including the best of them—*californicum*, do well almost anywhere, but best in peat. *L. giganteum* and *L. chalcidonicum* like warmth and shelter from spring frost, and then do well in either peat or light loam; so does *L. testaceum*. The Martagons are not particular, though the white variety has a tendency to degenerate into small bulbs. *L. canadense* dwindles away in peat, but does admirably well in the rich loam of the Daffodil beds, and from its variety of form and colouring, and spotting, is a most interesting Lily to cultivate. *L. superbum*, which approaches very near it in form and habit, fails with me everywhere. The hybrid varieties of *L. croceum*, which

figure in catalogues as "*umbellatum*," and under other names, are excellent for mixed borders, and succeed in any soil. *L. colchicum*, called also *monadelphum*, is perhaps the best hardy Lily to grow in a stiff soil. It does well in brick-clay, if well drained and well worked, and kept open with plenty of coarse sand. I grow many of this Lily from seed; the seedlings flower at three or four years old, and vary much in shade of yellow, in spots, and in the colour of the anthers. The common yellow Martagon (*L. pyrenaicum*) grows in any soil, but is not a choice Lily; the red variety is worth growing, being the most vigorous of the red Lilies. The more brilliant scarlet *L. pomponium*, the brightest of all, is a capricious Lily, sometimes flowering very well in large bunches, but at others shedding more than half its buds before they open. This is a constitutional fault, and as I find it has the same habit in every variety of soil, I attribute it to atmospheric influences. *L. candidum* and *L. tigrinum* I cannot boast about, for though I grow hundreds of both, they are never in the best form. The former wants a warmer soil than mine. The Tiger Lily does better than before, since I have planted it on very elevated beds in very sandy soil.

I may mention, as an instance of my difficulties of soil and climate, that nothing I can do will persuade the common Crown Imperial to flower with me. However, by perseverance I have contrived to get a good display of Lilies through June and July, so I advise other amateurs who have failed hitherto not to allow themselves to be beaten, for all can do as much as I have done.

I may add that I have several times tried this covered-bed treatment for the North American terrestrial Orchids, but without success, though the material for the trial was abundant and varied. We have still to learn how to grow these splendid plants in England, though my American correspondents will not believe in the difficulty. I thought they would do in this Lily bed, because indigenous seedlings of *O. maculata* come up in the peat and grow into large tubers, producing very fine spikes, and *O. foliosa* does fairly well. Vacant spaces in this bed may be filled up by many plants which will suggest themselves to gardeners, for instance *Hepaticas* are now gay by the side of the central path, when their flowers are smothered by snowstorins outside. *C. Wolleyi* Dal, *Llandudno*.

NEW OR NOTEWORTHY PLANTS.

LÆLIA ELEGANS TAUTZIANA, n. var.

This is the grand *Lælia elegans*, that has excited the admiration of so many orchidists, the treasure of Mr. R. H. Measures, of the Woodlands, Stratham, S.W. It comes near that type with the sessile central lacinia which I proposed to call *Mooreana*, and may be grouped under it. Its very large flowers, of the brightest colour, are gorgeous. The sepals are very broad, and light purple, petals cuneate-obovate, blunt, very broad, dark purple, splendid. The lip has white lobes with very dark tips. The mid-line of the disc is broad and dark purple, and there is a yellow space on each side. The mid-lacinia is of the darkest purple, and distinctly emarginate in front, the edges are crenulate on the side. Column purple at the top, sulphur at the base.

Mr. R. H. Measures has kindly given me the history of the plant. I believe your readers will like to know it. "One of Mr. Sander's collectors came across a small batch of *Lælia elegans* growing by themselves. Owing to the great beauty of the flower of one he christened it 'King of the Woods,' afterwards collecting this plant and a few others. The flowers of this I send you. He also discovered another, which he christened and labelled 'King of all the Woods,' and, not satisfied with this christening work, he goes on christening one 'King of these Kings.' He collected and sent them home to Mr. Sander, meeting with a chapter of accidents, breaking his arm, &c., which delayed him, so that in reality these three varieties came in three different batches.

"Being at Mr. Sander's one day I saw the first batch, and purchased the whole. Mr. Sander afterwards kindly informed me when he received the second and third batches, and these I also secured.

"In growth they are quite distinct from any of the other *Lælias*. The bulbs are stouter, the leaves very broad and thick. Some of the pieces are mixed with a stout-bulbed *Lælia purpurata*. I am in great hopes of getting something extra good."

And the best is at the end. As there is already a *Lælia elegans Measuresiana*, Mr. R. A. Measures proposed to me to name his brilliant *enfat chéri* after his rival, Mr. Tautz, of Goldhawk Road. I followed with great pleasure this very chivalrous suggestion. *H. G. Rehb. f.*

ODONTOGLOSSUM DICRANOPHORUM, n. hybr. nat. (?)

Mr. W. Bull kindly sends me this highly interesting *Odontoglossum*. The outside of the flowers fully corresponds to that of my *Odontoglossum subuligerum*, but the details of the lip are totally distinct. It may be conjectured that it is a hybrid, and one cannot help thinking of *Odontoglossum triumphans*, notwithstanding the narrow floral envelopes, and in order to help to lessen one's perplexity one may think of *Odontoglossum Lindleyanum*. The flowers are in a lax raceme, my part showing five flowers, partly fallen. The flower is equal to that of a good *Odontoglossum triumphans*, yet, as already stated, all the parts are narrower. Sepals linear, ligulate, acute, narrow, light yellow, with two large brown areas. Petals broader at the base, narrower at the acuminate apex, with one brown area in the middle, and some brown spots at the base. Lip of the lightest yellow, unguiculate, unguis partly adnate to the column, then oblongo-elliptic till the middle, and finally suddenly contracted into a linear acute yellow mid-lobe, with a brown area in middle. From base to centre projects a single broad, depressed callosity, extending into two free, accipitous, thickish lamellæ, which, with the superior callus, give the aspect of an old-fashioned two-pronged fork, whence the name. Column trigonous, with an angle in the middle, and two square toothletted wings at the top, lightest yellow at the base, pure white at the top. *H. G. Rehb. f.*

CYPRIPEDIUM DILECTUM, n. sp. (hybr. nat.)*

This is an unexpected novelty that was kindly sent me by Messrs. H. Low & Co. It appears to have leaves quite like those of *Cypripedium Boxalli*. I have only one fine flower just expanding, hence I am doubtful whether the petals bend, as in *Cypripedium Boxalli*. I believe, however, they do not, for they are broad at the point, and they are short. The median sepal is narrow, oblong, quite blunt at the top, where there is a short white margin. The light green lamina is covered with rows of irregular spots of a peculiar black, with a hue of Indian purple. The lateral sepals form a narrow oblong light green body, with some short rows of dark lines and spots at the base. The petals are cuneate, oblongo-obovate, and blunt. A dark line of black runs over their middle. The superior part is of a peculiar purple-mauve, excepting near the black line, where it is light green. The base is light green, with numerous black spots. The inferior part is green, with some obscure indigitations of some mauve reticulations. Lip rather slender, central portion two-horned, with retuse median border, yellowish-green outside, full of blackish-purple spots inside. Staminode narrower than in *Cypripedium Boxalli*, trilobed at the apex, mid-lobe roundish retuse, broadest side lobe toothlike. Ovary covered with dense hairs, nearly equal to the light green bract. Peduncle with numerous hairs.

I forego all hypothetical remarks, as I have very

* *Cypripedium dilectum*.—Quasi intermedium inter *Cypripedium Boxalli* et *C. hirsutissimum*; peduncle piloso, bractea ovarium dense hispidum aequante; sepalo impari anguste oblongo obtuso; sepalis lateralibus connatis angustioribus; tepalis cuneato-oblongo obovatis obtusis; labello gracili; sacco superne nate atrinque cornuto medio retuso, staminodio angusto, antice trilobo, lobis lateralibus dentiformibus; lobo medio lato obtuso retusosculo. *H. G. Rehb. f.*

good reasons to hope for the acquisition of further knowledge in a short time. *H. G. Rehb. f.*

CYPRIPEDIUM CALLOSUM (*Rehb. f.*) SUBLEVE, *n. var.*

I have already stated, in Professor Wittmack's continuation of his Excellency Dr. von Regel's *Gartenflora*, that a callosum was represented without any calli on the disc. Mr. R. H. Measures has just kindly sent me a similar flower and a leaf, the latter, too, being distinct. The plant came "out of a batch of *C. callosum*." It might be supposed to be a natural hybrid; but I do not believe it. To begin with, these things have appeared at various places (see *Lindenia*, l. xxiii.), then Mr. Regnier would have brought the other parent. Therefore I propose the name above given. *H. G. Rehb. f.*

PHALÆNOPSIS JOHN SEDEN (LUDEMANNIANO-AMABILIS), *n. hybr.*

Of all the many surprises which have emanated from that wonderful laboratory at the Royal Exotic Nursery, this is, to my mind, altogether unsurpassed—something quite unique. Its great beauty, is acknowledged by all who have seen it. The flower, 3 inches in diameter, ivory-white, densely and uniformly spotted all over both sepals and petals with small dots of a beautiful light purple, the lip suffused with light rosy-purple; the whole shape of the flower about as intermediate between its well-known parents as can well be imagined—and you have a picture of the new beauty. But the accompanying portrait (fig. 50) from an engraving obligingly lent by the Messrs. Veitch, will give a better idea of the general appearance of the flower, than any words of mine. It was raised by Mr. Seden from *P. amabilis* (the original plant of Blume, better known as *P. grandiflora*—not the *P. amabilis* of gardens), crossed with the pollen of *P. Luddemanni*, the seed having been sown in November, 1881. At the present time the plant has five oval-oblong, dark green leaves, 4 to 6 inches long. The peduncle has produced but a single flower—evidently a first attempt, for as both parents produce several flowers it is almost certain that the offspring will do the same as it gets stronger. Flower exactly 3 inches in diameter; the lateral sepals oblique, 3/4 inch in diameter, upper one elliptical, obtuse, and scarcely narrower; petals broad, obtuse, almost an inch in diameter; lip three-lobed, lateral lobes fleshy, sharply keeled below, partially spreading; terminal lobe diamond shaped, sharply keeled in front, the apex upturned at right angles, and bearing a pair of subulate white tendrils, quite one-eighth of an inch long; the crest oblong, deeply channelled longitudinally, narrowed in front, and terminating in a pair of acute points. The ground colour of the flower is ivory-white, except the front lobe of the lip, the front of the side lobes, and the crest, which are suffused with pale rose; the crest and the base of the side lobes having a faint trace of yellow. Both sepals, petals, and lip are densely and uniformly dotted with light purple, those situated towards the base of the side lobes being of a bright rosy-crimson, also those of the crest. Thus the flower has the general shape and broad petals of the seed parent, from which also the crest and the tendrils of the lip are derived. The ground colour of the flower may also be traced to the same source, while the purple spots are as plainly derived from the pollen parent. The lip is wonderfully intermediate, both in the shape of all the lobes and in the spread of the side lobes; and what is very remarkable is that while the sharp keel of *P. Luddemanni* is present on the front lobe of the lip, yet this organ is destitute of the long hairs of the parent species. The dark green colour of the leaves also comes from *P. Luddemanni*. It is interesting to note the combination of characters in the offspring, as the two parents are so different from each other. It is with great pleasure that I dedicate the charming plant, at Mr. Harry Veitch's special request, to its raiser, Mr. John Seden, to whom our gardens are indebted for so many novelties—few of which equal and none sur-

pass, in distinctness and beauty, this, his latest production. *R. A. Rolfe.*

CYPRIPEDIUM PEETERSIANUM ×, *nov. hybr. Belg.*

This was kindly sent me by Mr. A. A. Peeters, 58, Chaussée de Forêt, St. Gilles, Bruxelles, and to whom I have dedicated it. It was raised from *C. barbatum* as the pollen parent and *C. philippinense* (*levigatum*). The leaf is green, with darker nerves; peduncle deep Dahlia-carmine, hairy; bract nearly equalling half the ovary, green, with dark spots at the base. Upper sepal transverse, half oblong, blunt-acute, white, with very broad Dahlia-carmine coloured nerves (seventeen); inferior sepal smaller of nearly the same shape and colour. Petals broad, ligulate, deflexed, undulate and ciliate, mostly on the upper side at the base, there whitish, with rows of small dark spots. The greatest part of the petal is of a light Dahlia-carmine colour at the base; there are a few blackish spots, and then dark nerves run over the inferior part. Lip shaped nearly as in *Cypridium barbatum*, reddish-brown above, ochre-coloured beneath. The staminode is exceedingly interesting. It is an oblong concave body, with a strong upright border, full of elevated reticulations, and covered with numerous stiff hairs. In front it is forcipate, like the maxillæ of some *Coccinella*, but much more curved. In the sinus, a small angle stands in the middle. The flower is equal in size to that of a large *Cypridium barbatum*, but the petals are much longer. *H. G. Rehb. f.*

ODONTOGLOSSUM DIMYSTAN, *Rehb. f.*

Mr. F. Sander has sent me a fine panicle of this from Mr. J. D. Finlay, of Easterhill, Tollcross, Glasgow. It is very well developed, and the column is provided with fully developed linear-falcate wings. *H. G. Rehb. f.*

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT FERNSIDE, BICKLEY.

MAKING the most of the space at command is rightly interpreted by Mr. H. M. Pollett, to mean not covering all available ground with glass, but filling the neat little block of houses with the best things procurable. The *Odontoglossum*-houses give evidence of the great success attained in that direction by the rare hybrids there to be seen in bloom. At the present time, among a goodly array of fine *Odontoglossum crispum* and *O. Pescatorei* in bloom, are the unique *O. Ruckerianum* *insigne*, the finest of the section; *O. mulus* (*Bockett's var.*), with a fine spike of over twenty flowers; *O. elegans*, a rare *O. cirrosum* hybrid, and several other fine natural hybrids, among which one with four spikes bearing together over fifty flowers, is a grand object and curious withal, for it seems to be between *O. mulus* and *O. Wilckeanum*. Other *Odontoglossums* in flower are *O. Sanderianum*, *O. Arnoldianum*, *O. Andersonianum*, *O. A. lobatum*, *O. Wallisii*, *O. sceptrum*, *O. Rossii* in masses; and *O. R. rubescens*, *O. Oerstedii* in masses; *O. hystrix*, and *O. blandum*, with seven spikes of twelve or fourteen of its pretty flowers on each—a neat and lovely object, especially when in a good dark variety as is the case here. With the other cool-house plants in the well-filled flowering plant-house were well-flowered specimens of *Oncidium Cavendishianum*, *O. cucullatum giganteum*, *O. Phalænopsis*, *Restrepia antennifera*, *R. guttata*, *Masdevallia amabilis striata* (*Rehb. f.*); some fine scarlet *Sophronitis*; several good *Lycaste Skinneri*, *Mesospidium vulcanicum*, *Maxillaria venusta*,

Epidendrum vitellinum; some good *Lælia anceps*, and *L. a. Percivaliana*, *L. præstans*, *L. flava*, *L. cinnabarina*, and *L. harpophylla*; the last three belonging to the same section, and not being often seen in bloom together, offer a good chance for comparison.

The *Cattleyas* are always well grown, and the *Trianas*, among which is a good form of the pure white *C. T. alba*, were making a good show, assisted by the *C. Percivaliana*, the best of which is "The Dell variety." The *Cœlogynes* were also fully out, and a good specimen of *C. cristata alba* with nine spikes is a covetable object. The *Chatsworth*, *Trenttham*, *St. Albans*, and *Williams'* varieties are also represented by well-grown specimens.

Among the *Cypridiums*, the most charming are two plants of *Sedeni candidulum* ×; *C. Schroderæ* × also is a noble thing; and the four plants in bloom of *C. Lecanum superbum* tell that it will always be a favourite; good specimens of *C. Boxalli*, *C. callosum*, *C. calurum* ×, var. *C. Dautbieri* ×, *C. vexillarium* ×, and others were in bloom; and *Dendrobium nobile Cooksoni*, *D. n. nobilium* (very fine), *D. n. Wallichii*, *D. Ainsworthii* ×, *D. devonianum*, and some *Phalænopsis* make up a show which, with other good things to follow, will continue for a long time yet. *J. O'Brien.*

CYMBIDIUM ELEGANS.

This handsome terrestrial Orchid seems to me to be but a variety of the well-known *C. eburneum*. The plant grows freely along with the *Odontoglossums*, but its large fleshy roots like plenty of space and material to ramble about.

ORCHIDS AT VICTORIA HOUSE, DUKINFIELD, LANCASHIRE.

Dukinfield, the residence of E. G. Wrigley, Esq. is, notwithstanding the smoky air of the surrounding district, famous for its Orchids. On the occasion of a recent visit to the garden, in one house alone there were of *Dendrobium Wardianum* 140 spikes, varying in length from 1 to 4 feet, and carrying altogether upwards of 1400 blooms. In an adjoining house were several other plants of this variety, one of which with three enormous growths, each about 5 feet long, carried respectively, thirty-six, thirty and twenty-seven fine flowers. Other *Dendrobes*, either in flower or showing, were *D. primulinum*, *D. nobile*, a fine batch just over; *D. n. nobilium*, *D. albo-sanguineum*, *D. Ainsworthii* ×, *D. crassinode*, *D. Parishii*, *D. Jamesianum*, promising to be very fine; *D. chrysotoxum*, *D. Griffithianum*, *D. Schroderi*, *D. Linaweanum*, *D. Falconeri*, showing very strong growths; *D. fimbriatum*, *D. Pierardi*, with many flowers open, and many more to follow; *D. devonianum*, just opening its first flowers; *D. Brymerianum*, with several of its very pretty flowers; and last, though not least, *D. heterocarpum*, whose sweet perfume filled the air.

The *Cattleyas* are well managed, the foliage having the bronzy hue and firm texture denoting perfect health. Several fine pieces of *C. Percivaliana* were carrying many fine flowers, the lovely violet shades of which showed up well against a large pale-flowered form of *C. Trianae*. Many fine plants of *C. Mendelii*, *C. Mossii* (one fine variety here has been mentioned by Mr. B. S. Williams in the *Orchid Album*), *C. Lawrenceana*, are bristling with flower sheaths. Other varieties worth mention are *C. Warneri*, *C. choroensis*, *C. eripa*, and fine pieces of *C. citrina*, fixed to pieces of board, are showing well for flower. At the shady end of the *Cattleya*-house is a fine specimen of *Sobralia macrantha* with fifty growths—a fine plant, in perfect condition. A very large pan of *Cœlogyne cristata*, *Chatsworth* variety, was carrying twenty-four spikes, but many others had been cut; another pan of the ordinary variety of *C. cristata* had borne upwards of 200 flowers. A fine plant of *Thais Wallichii* was throwing up three flower-spikes, and on a shelf near the roof some fine pots of *Eleone lagenaria* were strong and very healthy. *Odontoglossums* were not numerous; but plants were observed of *O. Rossi* and its varieties *R. major* and *O. R. m. rubescens* flowering freely. Several strong pieces of *Oncidium spha-colatum*, *O. incurvum*, *O. Cavendishianum*, and others, were showing flower-spikes.

A healthy stock of plants of Camellias and Azaleas is doomed to make room for some hundreds more of Cattleyas, &c. Mr. Wrigley, is a gentleman bent on excelling in all his undertakings, and is ably seconded by his head gardener Mr. C. Harris, who is evidently a successful cultivator of Orchids. *B. Ashton, Glossop Hall.*

ONCIDIUM PHALENOPSIS.

A charming species, with panicles of flowers; sepals and petals oblong acute, white with reddish spots, lip 3-lobed, the two lateral lobes small, the terminal lobe transversely oblong, notched, white, the basal portion thickly crimson spotted. *Lindenia, t. 123.*

PLANT NOTES.

HOWEA (KENTIA) BELMOREANA.

A LARGE plant of this, 42 feet high, and which hitherto has been known as *Hedysepe* (*Veitchia*) *canterburyana*, has lately developed flowers and ripened fruit. It is certainly the true *H. Belmoreana* of Beccari (originally named *Kentia Belmoreana* by F. Muell.), although in its present state it differs very markedly from the smaller plants grown under this name, and which are so popular as decorative plants both here and on the Continent. There seems, however, no reason for doubting that the plants grown in gardens are the true *H. Belmoreana*, as the seeds which produce them are exactly the same as those borne by the Kew plant, and as those in herbaria. A figure of it has been prepared for the *Botanical Magazine*. So far as the plants and specimens at Kew enable one to judge there is no difference between *H. Belmoreana* and the following:—*H. Forsteriana*, Becc.; *H. australis*, Wendl.; and *H. (Kentia) rupicola*, Hort., Linden.

BAMBUSA VEITCHII.

The hardy Bamboo recently referred to under this name, and described in the *Revue Horticole*, as a handsome plant, does not appear to differ, so far, at least, as habit and leaves show, from *B. palmata* of M. Latour Marliac, who recently distributed it along with other new kinds of Bamboo. It has stout leaves 2 inches wide and 7 inches long, broad and rounded at the base, and the apex suddenly narrowed to a point; the midrib is almost white, and there are from eight to twelve prominent parallel nerves on each side of the midrib; the margins are clothed with minute teeth. If it prove really hardy, this plant, whatever name it bears, will be a useful addition to the few hardy Bamboos already known.

ARISTOLOCHIA WESTLANDII.

This is a new and handsome flowered species of *Aristolochia*, which was discovered and sent to Kew by Mr. Westland, of the Hong Kong Botanic Garden, and formerly of Kew. It was described by Mr. Hemsley under the above name in the *Journal of Botany* (Ed.) It may be called an enlarged *A. longifolia*, of which a figure was given a little while ago in the *Botanical Magazine*, t. 6884, but it is a much finer plant in every way. The leaves in *A. Westlandii* are 9 inches to 1 foot long, lance-shaped rugose, hairy, with prominent veins, and somewhat leathery texture. The flowers, which are borne on the old stems and branches, are 4 inches across, of the usual Dutchman's pipe shape, but with the somewhat flattened expanded limb divided into broad partly infolded lobes. The colour of the limb is tawny-yellow, with dull purple veins on the inside, and dull green on the outside, whilst around the orifice or throat there is a ring of purple and an outer one of white. Both this and *A. longifolia* are now flowering at Kew; a figure of the former has been prepared for the *Botanical Magazine*.

STRELITZIA NICOLAI.

This plant is so similar in habit to *S. Augusta* that Bentham said they were one and the same, as indeed was stated at p. 299, but a comparison of the flowers shows that there is a marked difference in

the size and colour of the bract, the colour of the halbert-like petals, and in the form of the basal lobes of the latter organs. In *S. Augusta* the petals are white, and the auricles or lobes short and rounded, whilst in *S. Nicolai* they are slate-blue, tinged with purple, and the lobes are long and bluntly acuminate. *S. Nicolai* is figured in Regel's *Gartenflora*, 1858, t. 235, where it is stated that this species was introduced from Madeira to St. Petersburg Botanic Garden. I saw it in flower in Madeira last winter. It does not appear to have been noticed at the Cape, although it must have come from thence to Madeira. *W.*

NEW ZEALAND: ITS FRUIT AND FOREST TREES.

I STAYED during July and August last at Whangarei, a small township in the provincial district, and about 100 miles north of Auckland. In the latter part of July the Whangarei Fruit Growers' Asso-

the State Forest Department, of which Professor Kirk is Chief Conservator, has a reserve of upwards of 4000 acres, a portion of which, at the time of my visit, had been cleared and ploughed ready for planting different kinds of Eucalypti and Wattle. The best descriptions of Wattle bark for tanning purposes are considered to be the black or feather-leaved (*Acacia decurrens*), and the golden or broad-leaved (*A. pycnantha*). About 10 acres, in a sheltered valley, had been selected for trenching and planting with fruit trees, chiefly Apples, of which some 300 different varieties had been obtained from various nurseries, for the purpose of testing their suitability to the district, with a view to supplying reliable information to intending planters, and for propagation for distribution. A few kinds of Pears, Plums, and Oranges, were also being planted.

The American Blight (*Schizoneura lanigera*) has become a destructive pest in many orchards throughout the colony. It is now a well-known fact that certain varieties of the Apple exhibit a greater blight-resisting power than others. The kinds

FIG. 50.—PHALENOPSIS JOHN SEDEN. (SEE P. 331.)

ciation held their first Citrus show, which proved a very successful one. The numerous exhibits of the different varieties of Orange, including Queen, St. Jago, Mandariu, Navel, Paramatta, Blood or China, St. Michael, and Siletta, or Bunch, were all first-class; some large fruit of a variety named Poor Man were shown in most of the collections. Lisbon Lemons, Limes, Citrons, and Shaddocks, were also well represented. The exhibits of Apples were numerous, one exhibitor showing upwards of eighty distinct varieties. After the exhibition closed, the best specimens of fruit were selected and sent to Auckland, where they were again exhibited, and much admired. The show of Citrus abundantly proved that the soil and climate of the district north of Auckland are well suited to fruit culture; and judging by the number of orchards already planted, and still being formed, in the country—where every settler now considers an orchard a necessary adjunct to his house—will shortly become a great fruit-producing one. Pears, I think, are hardly receiving the attention they deserve, owing probably to the partial failure of a few of the kinds already tried by some of the settlers.

About 3 miles from the township of Whangarei,

selected here by fruit growers and nurserymen for stocks are the Northern Spy, Winter Majetin, and Irish Peach, with very satisfactory results when compared with trees worked on ordinary seedling stocks; for this reason, great care has been taken by the Forest Department to secure plants worked only on blight-resisting stocks.

A large portion of the area reserved is still in its natural state, covered thickly with tall Fern and Titi-tree (*Leptospermum scoparium*), interspersed with grand clumps of mixed bush or forest, representing the greater part of the forest vegetation of New Zealand, and comprising a large variety of valuable timber trees; the following kinds being some of the most conspicuous:—Rimu (*Dacrydium cupressinum*), sometimes called the Red Pine; Karaka (*Corynocarpus laevigata*), this, and the first-named being in my opinion two of the most ornamental trees of the forest; Totara (*Podocarpus totara*), Puriri, or New Zealand Oak (*Vitex littoralis*); Rata (*Metrosideros robusta*), Kanri (*Dammara australis*), the Mountain Beeches of Nelson and Otago, and many others. A noteworthy feature of the forests in this district is, that while they contain timber trees not found growing in any other part of the colony, they include as

well all the other kinds found in more southern districts.

Amongst the undergrowth, rising from a mass of Ferns, were flourishing with a vigour never attained except in their natural habitats, the Ti (*Cordyline australis*), Toi (*C. indivisa*), Tingahere (*C. stricta*), Koromiko (*Veronica*), the Screw Pine; Akeake (*Dodonia viscosa*), New Zealand Flax (*Phormium tenax*), known here as the Settler's Friend, being useful for a great variety of purposes: *Ripagoum parviflorum*, well known here as the Supple Jack—a cane which climbs to the tops of the highest trees, and makes the forest in some parts almost impassable, splendid specimens of the graceful and beautiful Nikan (*Areca sapida*), attaining the height

on two days heavy hail fell. The indigenous forest vegetation of New Zealand being evergreen, there is no indication, by the presence of various tinted falling leaves and leafless branches, of the approach of autumn and winter, as is now becoming apparent in public gardens and domains, where many of the most useful and ornamental deciduous trees of Europe and America have been introduced, and are flourishing with a vigour scarcely attained in their natural habitats.

The following are the meteorological observations taken at Auckland for July, 1886:—Mean temperature in the shade, 49°·9 (previous twenty-one years, 52°·2); maximum temperature, 60°; minimum temperature, 37°. Total rainfall for the month in

many thousands of tons still lie buried beneath the soil. The total quantity of Kauri-gum exported from the colony for the year 1885 was 58;5½ tons, valued at £299,762. A barque, which has just completed loading, and is now lying in the stream ready for sailing, has amongst her large and valuable cargo for New York 3825 cases of Kauri gum, valued at £17,459.

Adjoining the forest reserve proper, 100 acres of volcanic land, made over to the State Forest Department by the Whangarei County Council for experimental purposes, is being prepared for the trial of Olives, Tea, Cinchona, Tobacco, and other exotics.

When writing of the Whangarei Citrus show, I

FIG. 51.—LEYSWOOD, GROOMBRIDGE.

of 40 feet, and here the only representative of *Palmeæ* New Zealand has been called the land of Ferns, and really for number of varieties and vigour of growth I never saw equalled the display I passed through in some of the densest parts of the forests—Ferns everywhere in abundance, above and below, from the stately *Cyatheas* and *Dicksonias* to the small *Trichomanes* and *Hymenophyllums* with which the ground, and in many cases the trunks and branches of trees were thickly covered, intermixed with *Davallias*, *Polypodiums*, *Lygodiums*, and *Asplenium flaccidum*. Amongst others were grand specimens of different varieties of *Asplenium*, *Adiantum*, *Doodia*, *Gleichenia*, *Nephrodium*, &c.

The time of my visit was July, one of our coldest months, corresponding with January in Great Britain. On two mornings the thermometer registered 3° of frost, the rainfall on several days being very heavy;

inches, 2·200 (average for the same month, previous twenty-one years, 4·776); number of days on which rain fell, twelve (average for previous twenty-one years, twenty).

There are extensive gum fields around Whangarei, where a great number of persons find employment digging for Kauri gum, a brittle resia-like copal which exudes from the Kauri Pine tree (*Dammara australis*). The gum is not obtained by any process of tapping the tree while standing, but is found beneath the soil on the sites of old Kauri forests that have ceased to exist. The practical gum digger, armed with a long spear, selects a likely spot, and keeps prodding the earth until, from touch of the spear, he knows that he has struck a piece of the hidden spoil; it is then unearthed with a spade. The Kauri gum industry is a valuable one, and likely to last for many years, for it is very probable that

omitted to mention that amongst the exhibits there were three or four very good samples of arrowroot prepared from the roots of *Canna edulis*; samples of locally-grown Ginger were also shown. These at present have only been cultivated on a small scale, but I believe it is the intention of the growers to extend the cultivation of both these products during the coming season. *Edgar Spooner, Auckland, New Zealand, December 3, 1887.*

LEYSWOOD.

To make our series of illustrations of this beautiful place more complete, we add a view of the house (fig. 51). The description of the rock-garden was given at p. 272 of our last volume, September 3, 1887.

PLANT DISEASES.

MOULDS.

HENR. P. MAGNUS has lately brought before the Brandenburg Botanical Society, some observations on the winter condition of several species of Peronosporæ, which may prove of considerable practical importance to horticulturists and their friends.

It is well known that several species of Peronospora pass the winter in the form of resting spores or oospores, in the decaying tissues of the host plant; for instance, the fungus of the so-called Vine mildew (*Peronospora viticola*) produces oospores in the leaves, and as these fall to the ground and rot, the oospores are set free ready to germinate in spring, and again attack the plants. The practical difficulties against the collecting and burning of the leaves in the vineyards are increased by the facts that the leaves go on falling during about two months, and the dry leaves break in pieces.

In the case of some other Peronosporæ, however, no oospores are known—either the fungus does not produce them, or it fails to do so in Europe, or on the plants attacked.

Thus the author points out, *Phytophthora infestans*, the dreaded Potato disease fungus, develops no oospores in the tissues of the plants attacked in our climate; but the fungus passes the winter in the form of mycelium in the tubers. This winter mycelium is developed from conidia or zoospores, the germinal tubes of which enter the "eyes" of the tuber. Such infected tubers, after a short time in a warm damp atmosphere, develop new conidia from the eyes, and so spread the malady.

Magnus praises Jensen's method of treating the matter, *i.e.*, to cover the base of the young Potato plants with a deep layer of soil, and to be careful not to dig the tubers from diseased plants until a fortnight or so after the dying down of the haulms. The first precaution is to guard against the conidia falling from the leaves on the tuber and infecting them in the soil; and the second is to give all conidia on the ground time to germinate and die before risk of rubbing on the tubers.

The Beet is frequently attacked by *Peronospora Schachtii*, and is not known to form oospores. It passes the winter as mycelium in the rosette of leaves. A closely related form is *P. effusa*, which occurs on winter Spinach and allied plants: this also develops no oospores in the Spinach, but passes the winter as mycelium in the diseased leaves. If the drooping leaves of attacked plants are taken in winter and placed under glass in a moist, warm atmosphere, the fungus soon shows that it is alive and capable of developing conidia. Two days sometimes suffice for this. In the spring, as the soil and air get warmer, the *Peronospora* puts forth conidia, which spread the disease on the young leaves, and much injury may accrue to the early spring crop. It is noteworthy that this fungus also lives on *Chenopodium* and *Atriplex*, common weeds, and summer Spinach is often infected from these.

Magnus also finds that *Peronospora alsinearum* passes the winter in the mycelium stage in the tissues of Chickweed; also *P. grisea* in young Veronicas. One or two other *Peronosporas* on weeds are also mentioned as passing the winter either as mycelium, or as oospores.

The importance of this contribution consists especially in the showing that these fungi are apt to select, as safe places for their winter rest the very organs—tubers, rosettes, &c.—which the gardener prizes and takes care of. The case is similar to that of some smuts—we carefully store in our granaries the Wheat, &c., which is already dusted with the spores; or the Potatoes, which already contain the mycelium, and on sowing or planting next spring the enemy is also sown or planted. Of course, as is well known, we can "dress" the Wheat; the treatment of the forms in question here has to be adapted to the different cases.

PARASITIC FUNGI.

These, as we all know, injure plants in various ways, a summary of which is given by Mr. A. B. Seymour. Parasitic plants injure their host plants:—1, by depriving them of nourishment; 2, impairing the power of assimilation; 3, abnormally accelerating or retarding growth, causing distortion; 4, not only green plants are affected, but roots, stems, inflorescence, flowers, fruit; 5, leaves and fruit fall prematurely; 6, decay is produced in ripe fruit before and after removal from the plant; 7, valuable plants receive injury from those of less value by ordinary infection or hetericisism.

CARYOTA SOBOLIFERA.

THE Caryotas are as singular among Palms as the Ginkgo or Adiantum tree is among Conifers. They are also exceptionally handsome in a decorative sense, and they grow freely in a moist stove temperature. At Kew they are represented by about a dozen species, some of which are now large and elegant trees. The finest of all, however, namely, *C. Rumphiana*, has recently been destroyed, as it had got too large for the Palm-house, its leaves having pushed some of the roof glass out last autumn. This tree was considered to be the most magnificent Palm ever seen in cultivation under glass. It had a clear stem 25 feet high, by over 2 feet in diameter at the base; the head of leaves was 25 feet high, and about 40 feet through; each leaf measured 22 feet in length by 17 feet in width, and was composed of 1800 pinnules, each of which was 15 inches long by 6 inches wide. The young heart of the stem, or cabbage, was of a beautiful ivory-white, very succulent and brittle, and had a taste very similar to that of a Cocoa-nut. The lower part of the stem was full of stout tough fibres, which seemed to run the whole length of the stem but when dry it appeared to have lost much of its toughness. A sample of the fibre may be seen in the Kew Museum. *C. sobolifera*, represented in p. 337, fig. 52, is a much smaller kind, and will attain its full height in a house 30 feet high. It is well represented at Kew in both large and small plants, and it appears to be a Palm very easy to grow. The stem grows to a height of about 16 feet, by about 5 inches in diameter, and it is greenish and marked with ring-scars. The leaves are about 10 feet long, gracefully curved, bipinnate, the petioles and sheaths covered with brownish scurf, and the pinnules are shaped like the fin of a fish. This bipinnate character in the leaves is peculiar to the Caryotas. The flowering of Caryotas is also singular. "After the Palm has attained its full height, an enormous bunch of flowers like a docked horse-tail, and all of one sex, emerges from the axil of one of the uppermost leaves; this is followed by a similar bunch of flowers, but of the opposite sex, from the axil of the leaf below it, and then bunches of alternating sexes appear from successive leaf-axis till the lowest of them is reached, when the stem dies" (*Kew Guide*). The flowering period extends over several years, and it is not unusual for ripe nuts and flowers to be found on the plant at the same time.

In *C. sobolifera* and several others, numerous offsets are produced from the base of the stem, and these appear at an early stage, so that by the time the first stem has flowered others are ready to take its place. A specimen of *C. Cumingii* at Kew has gone on renewing itself in this manner for many years. There does not appear to be any difference between this and

C. sobolifera. The seeds of Caryotas are usually purple coloured, round, except when two are produced in one fruit, when one side of the seed is flattened as in a sweet Chestnut, and they vary in size from that of a Nutmeg to a Coffee-bean. They germinate freely, and handsome young plants, 2 feet high, may be grown in two years. *C. sobolifera* is a native of Malacca and Thibet. *W.* [The tree was alluded to by Mr. Adlam, in his account of the Durban Botanic Garden, which appeared in our last issue, p. 300. Ed.]

PLANTS AND THEIR CULTURE.

DIFFENBACHIAS, CORDYLINES, DRACÆNAS, AND ERANTHEMUMS.—These are very fine decorative subjects, and to keep up a good supply of suitable sized plants frequent propagation must be had recourse to. If large tops of *Dieffenbachias* are taken off with about 4 inches of stem below the leaves, inserted in small pots, using light soil with a pinch of silver-sand at the base of the cuttings, and stood in the propagating-house, or where a moderately high moist temperature is maintained, they will root in about a fortnight. The remaining portion of the stem may be cut into as many pieces as there are joints, and planted thickly, either in pans filled with sandy soil, or in the plunging material in the propagating frame; but whichever way be adopted, see that in covering them only the eye or bud is exposed above the material. Plants thus raised, when potted up in 60's and 48's, make neat and useful stuff. *Dracænas* and *Cordylines* may be treated in a similar way, but in taking off the tops of the old plants instead of potting them at once, it is better to stand them where the stem can be inserted in water to a depth of about 2 inches; bottles filled with water answer very well where only a few require to be done, taking care that the water does not decompose, which, if it do, would cause the stems to rot. They should be potted immediately that there are any signs of roots being formed, as roots formed in water do not readily take to soil; cut up the rest of the stem, and put in the eyes as recommended for *Dieffenbachia*, but roots form more freely if the side opposite to the eye has the slightest paring taken off with a sharp knife. As it is important to success that the eyes be kept equably moist, yet not wet, pay particular attention to the covering, as before mentioned. With the *Erantemums*, the usual mode of propagation is by cutting, and clean stout shoots should be selected; they will, however, require to be put in a frame or under a handlight. These plants all succeed well in a mixture of loam and leaf-soil or peat, but liberal treatment is necessary to do them well, therefore a good sprinkling of manure may be added to the potting soil; bone-dust and decayed manure give excellent results. The best of the *Erantemums* are *albo marginatum*, *tricolor*, *atropurpureum*, *reticulatum*, and *leuconeura*. Of *Dieffenbachias* the varieties are very numerous, but every collection should include *Baraquiniana*, *Bausei*, *Leopoldi*, *Rex*, *Regina*, and the small but handsome *Weirii*; of *Dracænas*—*Goldiana*, *Lindeni*, *umbraculifera*, *fragrans*, and *Smithii*, are among the best, but *phrynoides* is a very dwarf species, with large green leaves, thickly studded with yellow spots; it produces annually large clusters of red fruits, which add much to its beauty; *surenlosa maculata* is rather tall-growing (about about 6 feet), Bamboo-looking plant, with small green leaves, spotted with yellow—it has also red fruits, which droop gracefully from the stem. *D. fragrans*, a green-leaved species, has fine bold foliage and heavy racemes of flowers. *Cordylines*—of these there are so many beautiful new hybrid varieties, that they may be had, with foliage varying from dark red to white or green, in all the intermediate shades of colour between, but *terminalis*, *Cooperi*, *australis*, *indivisa*, and *indivisa Veitchii*, *congesta*, *Guilfoylei*, and *gloriosa*, are among the most useful. All these plants, with the exception of *Cordylines australis*, *indivisa*, and *congesta*, require a moderately high temperature—about 65°, with a moist atmosphere when making their growth, after which time they should be carefully hardened off; they will last in good

condition for a long time. Occasional thorough syringings are beneficial, but avoid habitual dewing, as, unless the water used is free from sedimentary matter, the leaves get disfigured.

Eupatoriums.—Any plants of these which are pot-bound and coming into flower should be liberally supplied with liquid manure, and on no account allowed to become dry, as their soft leaves are easily injured by flagging, which ruins them as decorative plants. The most telling sorts are *E. lantibium* and *atro-rubens*; the latter is the better of the two, and darker in colour, both being purple or reddish-purple. They are frequently met with in gardens under the name *Hebeclinium*. Possibly the best known *Eupatorium* flowered is *riparium*, and its variety *odorata*; both are neat, dwarf, bushy growers, and very floriferous. *E. Weinmannianum* is a noble erect-growing species, its Willow-like shoots terminating in dense corymbose heads of sweetly scented white flowers. These plants are excellent for supplying cut flowers, and for conservatory decoration during the spring months. The two first-mentioned sorts are not quite so hardy as the others, and are much benefited by being brought on in a temperature of 55°. The others will do where frost is merely excluded.

Capsicums.—Many of these, when well fruited, make handsome decorative plants, and in order to secure good-sized plants, seeds should now be sown and placed in a warm pit. As soon as the seedlings are well up prick them out thinly into pans or boxes, using a light, friable, loamy compost. After pricking out give a good watering and return them to their former quarters, keeping them well up to the glass, afterwards potting them off singly into 4-inch pots and subsequently in 48's and 32's according to the size to which the kind is expected to grow, using the same kind of soil as before. They do well in a temperature of about 60° until the fruits are well developed, when they may be removed to the greenhouse. These plants, being somewhat subject to red-spider, should have occasional syringings, and be ventilated freely at all times, but much syringing should be avoided when they are in flower. Prince of Wales and Little Gem types are the most useful. *F. Ross, Pendell Court.*

THE ORCHID HOUSES.

DENDROBIUMS.—While trying to preserve the beauty of *Dendrobium* flowers as long as possible by placing the plants in cooler quarters, the new growth on those that have started should not be overlooked, for if much checked in its early stage, the plants will not have matured such fine pseudobulbs by the end of the growing season as those of the previous year, and will not produce an equal quantity of bloom. Any *Dendrobes* which have been forced into flower in a strong heat should, when placed in a cooler house to preserve the flowers, be kept rather dry.

Thunias are now beginning to push up new growths, and should be shaken out of the old compost. As with these plants the strongest pseudobulbs produce the best flowers, about a dozen of these may be selected for each pot, and placed 2 or 3 inches apart, making each secure with a stake. The smaller ones may be put together in other pots, and grown on for stock. The *Thunias* are not very particular as to the compost used, and will grow in peat and sphagnum, but latterly I have employed about two parts light fibrous loam and one of peat, and mixed with this some broken Oak leaves, and a little coarse silver-sand. I have sometimes mixed in the soil a few ½-inch bones, but I cannot say that the plants derived much benefit from these. A few years back I tried bones for several species of Orchids, but the only plant which showed any distinct difference by their use was *Mesospidium vulcanicum*, and this improvement might have been due to other causes. When used in the drainage of pots of *Cattleyas*, *Dendrobiums*, &c., a mould formed on the bones which did not seem to suit the plants, and the bones appeared to keep sweetest when surrounded by the heavy potting compost generally used for *Cymbidiums*, *Cypripediums*, *Calanthes*, &c. The night temperatures need not be raised much as yet if the thermometer outside in the evening shows 40°, or more; the East Indian-house will be safe at 65°; *Cattleya*-house at 60°, the cool-house at 55°; the *Dendrobium* or Mexican-house will bear a wider range of temperature, viz., from 55° at night, to over 80° with sun-heat by day. *C. Woolford, Downside, Leatherhead.*

THE FLOWER GARDEN.

EVERGREEN SHRUBS.—The necessary pruning and thinning out of these should be completed by the end of the present month. In doing this work it is good practice to cut back all straggling and misplaced growth, so as to maintain the symmetry of the plants, and at the same time not spoil their characteristic form. In clumps and shrubby borders each specimen ought to stand quite clear of its neighbour, where appearance and general effect are studied, and if the best results are desired; although in old shrubberies, and where these form wind-breaks, this cannot always be done, or is not desirable. Such plants as *Berberis stenophylla* and *B. Darwini* should have the old growths thinned out where crowded, leaving last year's shoots intact till immediately after flowering, and at which period the strongest ones may be cut back to within 2 or 3 inches of their base.

Old established clumps and banks of common Laurel, where they have become unsightly by having become top-heavy and naked at the bottom, may be cut down to within a short distance of the ground, and in the space of two or three years they will again make a presentable appearance. The leaders of young specimen Conifers are apt to get injured by squirrels and birds, and it will be well to tie up the nearest side shoot, so that it may take the place of the damaged one. The trimming and clipping wherever the so-called topiary work was not done in the autumn, should not be further delayed. Push forward—whenever circumstances will allow—all planting that yet remains to be done, as the time for work of this nature is now getting within narrow limits. Mulch with half-decayed manure, and stake and tie such as require it.

Hardy Perennials.—As soon as the surface-soil is sufficiently dry transplant from cold frames to permanent quarters all autumn-rooted plants, including *Pentstemons* (florists' varieties), *Violas*, *Pansies*, &c. As a preventative against the attacks of slugs it is advisable to place a mixture of lime and soot or wood-ashes round each plant, and at a safe distance from the stems to prevent injury. Remove handlights from *Heliborus niger*, and put the same over some of later flowering species, as *H. olympicus*, *H. kamtschaticus*, if clean and well developed flowers be desired. Protection may also be removed from *Lobelia fulgens*, *L. siphilitica*, and similar tender subjects; but let it remain close at hand for the present, as we are by no means beyond severe weather. *Cerastiums*, *Sedums*, *Saxifrages*, *Sempervivums*, and plants of a kindred nature used for carpet bedding may be planted in their permanent quarters if the beds are unoccupied with spring flowering plants; this will give them time to get well established, and will be a saving of labour at a later period.

Bedding Calceolarias.—Transplant into turf pits or to warm sheltered borders at the base of a south wall, where protection can be afforded in case of need. To have strong bushy plants in time for bedding out let them have a good compost consisting of turfy loam chopped into rough pieces, leaf-mould, and well decomposed manure, and pinch out the points of young growth as occasion requires.

Sweet Peas may now be sown in drills 3 inches deep. These will repay generous treatment, and it will be found a good plan to dig narrow trenches a spit deep, and half fill them with rotten manure, tread it well down, cover with 2 inches of soil, and then sow the seed. The latter should be either moistened with paraffin or receive a coating of red lead previous to sowing, as a preventative against the attacks of small birds. Lightly earth-up and support the plants with sticks when necessary. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

PEACHES.—The fruit in the early house will now be swelling rapidly, and, the stoning being completed, remove all fruits which are not required to a distance of 9 inches apart on young hearty trees, and 9 to 12 inches for old and those less robust. Tie down the shoots as they advance in length, taking care that all the main stems are bedecked with foliage to afford them partial shade from the direct rays of the sun. Do not overcrowd the trees with young growth, remembering that 6 to 9 inches

apart for young shoots is not too much; and it is better to remove any superfluous growth forthwith than to overcrowd, as this would be prejudicial to the crop next year, the preparation for that crop being made while that of this season is maturing. Stop strong shoots so as to balance the flow of sap over the whole tree. If the weather be mild the temperature may be advanced to 60° at night, but in the event of stormy weather be content with 55°. Endeavour to secure a temperature of 75° to 80° at shutting-up time, with abundance of moisture, heavily syringing the trees with tepid water twice a day. A little clear soot-water syringed over the trees twice a week, will impart a healthy hue to both fruit and foliage.

Succession Houses.—Attend to disbudding and thinning of trees in these houses as advance in growth is made, and see that they do not suffer for want of water at the root. Late houses, which will be coming into bloom towards the end of the month, should have a little fire-heat at night and during dull weather, to assist the blossoms in setting. Be careful to exclude currents of frosty air during the period of fertilisation.

Figs.—The earliest-started trees will now be approaching the setting period, and little progress will be noticeable until that is over, but as soon as the fruits begin to swell again, a rise of temperature of 5° may be allowed, 10° during stormy weather being the maximum. Thin out the fruit where necessary, the leaving of too many fruit on the trees being the most fertile cause of fruit dropping; the other is overcrowding of shoots preventing the full play of light and air to thoroughly mature the wood. See that old trees in pots, tubs, and other confined spaces, are not allowed to suffer from want of water, in the case of established trees weak manure being given at every other watering. The latest succession of trees should now be started, but if they have not the benefit of artificial heating do not excite them too much, or they may get checked by frosty weather. *W. M. Buillie, Luton Hoo Gardens.*

THE KITCHEN GARDEN.

CELERY.—Enough fermenting material should now be prepared and afterwards made into hotbeds, and the main crop of *Celery* sowed about the end of the month. As only moderate heat is necessary plenty of leaves should be mixed with the stable-dung, and about 6 inches of light sandy soil placed on the top in which to sow the seed. Major Clarke's Red and Sandringham White are two of the best salad varieties, and Carter's Incomparable Pink will stand a long time in the spring without running to seed. Where close cropping has to be practised the trenches may be got ready for the earliest crop, digging in deeply a good supply of manure for single rows, which are the best; the trenches should be 1 foot wide and 4 feet from centre to centre; for double rows or for strong growing varieties another foot in width will be necessary between the trenches. When all is in readiness the spaces between the rows will make a good position for planting early Potatoes which will be dug up before the *Celery* requires to be earthed up.

Asparagus.—The ground should now be made ready for any fresh plantations intended to be laid down, and should be deep, rich, and well drained, in order to grow the heads to perfection. Before planting, the ground should be liberally dressed with manure from the cowyard, and trenched two spits deep, if it will allow of this being done, and if thought to be too retentive of moisture it should have a good quantity of charred refuse or burnt earth well mixed in with the fork after the trenching is done. In cold and wet situations it is best to thoroughly drain the soil with pipes, too much water being very injurious to the roots of *Asparagus*. The best time for planting, is when the young shoots push; and two-year-old plants are the best. To get large heads plenty of space should be given the plants—2 feet between the rows and 18 inches from plant to plant being suitable distances. The so-called giant or colossal varieties grow to the largest size, but much depends on position, kind of soil, and the care bestowed on the cultivation. The variety called Early Purple Argenteuil is very useful, and although not so large as some others, it is ready for use several days earlier. The old system of planting on raised beds is not advisable in the majority of gardens, but may still be advantageously followed in gardens that are in cold, or wet districts. *W. H. Diers, Kilton Hall, Stamford.*

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SHOWS.

TUESDAY,	MAR. 20—	Royal Botanical of Manchester. Royal Botanic Society.
WEDNESDAY,	MAR. 21—	Preston and Fulwood (two days). Liverpool Horticultural Association. Bath Bulb (two days).
THURSDAY,	MAR. 22—	Shropshire.
FRIDAY,	MAR. 23—	Falkirk.
SATURDAY,	MAR. 24—	Crystal Palace.

SALES.

TUESDAY,	MAR. 20—	Imported and Established Orchids, at Protheroe & Morris' Rooms.
WEDNESDAY,	MAR. 21—	Imported Orchids, from Mr. F. Sauder, 10,000 <i>Lilium auratum</i> , Greenhouse Plants, and Roses, at Stevens' Rooms. Japanese Lilies, Roses, &c., at Protheroe and Morris' Rooms.
THURSDAY,	MAR. 22—	Importation of Orchids, from Messrs. H. Low & Son, at Stevens' Rooms. Orchids, at Protheroe & Morris' Rooms.
SATURDAY,	MAR. 24—	Bulbs, Roses and other Plants, at Protheroe & Morris' Rooms.

than in any previous three years within our recollection. Moreover, we are delighted to find that heed has been paid to the suggestions that we have ventured to offer, and that the new programme, by which attempts are being made to carry out, is widely different from the old narrow one-sided policy which has at last landed the Society in its present dilemma.

If the Society is to have no higher and broader aim than a flower-show society we should say. Away with it, its work is long since done, and younger and abler hands can do that work better. But if it can be made to rise even a little way towards its manifold duties to the State, to Agriculture, to Commerce, to Science, to Art, to its constituent gardeners, there is room for hope that a season of prosperity may yet be in store for the old Society. One of the happiest omens we have noted for a long time is the election as guinea Fellows of some thirty practical gardeners and well-known amateurs on one day. Prospects in the City are also bright, and we have reason to believe that the LORD MAYOR will take a prominent part in the first exhibition that the Society will make in his domain.

At this juncture, it is specially to be hoped that the Council will be cheered and encouraged in their very arduous task by the co-operation and support of all classes of horticulturists. We have all but one aim, let us subordinate our prejudices and individual fancies to the common good. Thus only will success be assured.

THE production of fruit in this country, and the various uses to which it can be put, both in a green and preserved state, was one of the most interesting points in the vigorous address delivered by Mr. D. TALLERMAN at the recent conference in Bakers' Hall. Fruit growing is a distinctive English industry, and from some statistics furnished by Mr. TALLERMAN we learn that the total orchard area in England is 195,071 acres, that for Wales is 3341 acres, and for Scotland 1872, or 200,284 acres in all; the total area for market gardens being 60,850, of which England possessed 35,650, and it was instanced; as illustrating a curious fact, that of the orchard area six English counties comprise two-thirds of the total—viz., Hereford, 27,112 acres; Devon, 26,414; Somerset, 23,640; Worcester, 18,527; Kent, 18,296; and Gloucester, 15,500; being 129,489 acres in all. It is thus seen there is a remarkable concentration of fruit growing in this country, and this fact, Mr. TALLERMAN thinks, "should favourably lend itself towards the success of any movement towards the introduction of new means of collection of material, the preparation of the same for sale, the distribution of the same to centres where markets can be found, and the realisation of the profits that should follow.

What is the present position of that distinct agricultural interest—fruit farming? The fruit grower is regarding as holding, as he has done for years past, "an isolated position; and after anxiously tending and watching his shrubs and trees through the varying climatic changes incidental to our spring and summer, when the season has advanced and the fruits ripened, recklessly plucks and packs them into large baskets, without any regard to size, condition, or character, sending to market for sale, when, if the season is a prolific one, the nett amount realised will reach but little in excess of the cost of packing, packages, and carriage; while frequently in good seasons, when crops are abundant, enormous quantities of fruit are allowed to rot on the trees, owing to their current market values being insufficient to

cover the cost of collection and transit. The losses from these causes are most serious, and readily preventable." Is this a too highly-drawn picture? We think not. In Kent there are hundreds of acres of Apple orchards forming a part of farm lands; the majority of the Apples grown are practically worthless for market purposes. The fruit is shaken from the trees rather than carefully gathered—it is thrown together in heaps at the bottoms of oast-houses without any attempt at sorting the large from the small fruits, or picking out those which are damaged; and it is sometimes sold in bulk to some itinerant purchaser who takes it at a valuation, and, as might be expected, generally a very low one. The orchard receives little or no cultivation; the branches of the trees interlace and interleaf each other; the fruit portion of the farm is looked upon as of small moment: so much do a kind of hereditary obstinacy and ignorance prevail. But that a fruit garden is a valuable appendage to a farm is shown from a fact mentioned the other day by Mr. C. J. HEALD, of Brighton, who stated that a man farming 300 acres of land in Sussex acknowledged that his orchard had enabled him to survive the reverses of the year from farming alone.

Is it not surprising that, while orchards of Apples and Plums, among other fruits, are left upon the trees because it will not pay to gather them, the bill we have to pay foreign countries for fruits is such an enormous one? The value of the importations of fruits that entered into competition with our own crops last year, as set forth by Mr. TALLERMAN, was as follows:—Raw Apples, £870,281; unenumerated, £1,290,411; Oranges and Lemons, £1,491,533; dried and preserved raw vegetables, £542,282; total, £4,194,507; and these figures serve to bring one fact prominently under consideration, viz., that we have become large buyers of fruits and vegetables from foreign producers, while our own growers have bitterly complained of their inability to reach our markets owing to the excessive rates exacted for the carriage of their fruits by rail, which left them little or no surplus after paying the costs and expenses incidental to preparing for market and realising the value.

Mr. TALLERMAN does nothing by halves, and by way of forcible illustration he had at Bakers' Hall samples of packages to show the marked difference between the home and Continental methods. His contention is that the latter convey a lesson, the details of which should be fully impressed on all our home growers. The latter pack the fruit loose in half-bushel or bushel sieves or baskets, that can only be dealt with by the trade and dealers; while on the Continent everything is packed into small boxes or baskets that meet the requirements of the ordinary consumers. Under the home system "the fruit is all thrown into the baskets, and varies in size and condition; and if at all ripe, or any of the berries be bruised or damaged, the weight of those on the top will largely affect those at the bottom, resulting in much of the fruit being spoiled and wasted—a loss that forms an element of consideration with the dealer when buying, and which eventually falls on the producer." Mr. TALLERMAN is here dealing with the practice that is general. It is well known that of late there has been a great improvement in the methods of packing and preparing for transit, which enables Plums and other fruits to be sent 200 or 300 miles without injury, but these cases form the exceptions to a general rule. On the other hand, "the Continental packages are neatly packed, the fruit being selected and made to

The Royal Horticultural Society.

THE last meeting of the Royal Horticultural Society at South Kensington was held on Tuesday last. A pretty little show was got together, and a goodly number of the craft were present, but few, indeed, of the general public. No one wept that we saw; no one seemed at all distressed at leaving, though the recollection of a quarter of a century's good work thrown away, as it seems, might have caused some despondency. In point of fact, it has not been thrown away. There is that scattereth and yet reapeth, and we believe that this will be found to be the case in this instance. But it is better not to indulge in retrospect. How about the future? No one seemed at all sanguine, and no wonder at that. Some few seemed to think the Society ought to have shut itself up in its shell like a tortoise in winter, and retired to Chiswick, at least temporarily. We do not share this view, but we are surprised that this feeling should not have found articulate utterance, for any useful purpose that is, till it was manifestly too late to act on it had it been considered desirable. It will, however, be still possible to retire to Chiswick next year if circumstances render it desirable.

If brimming energy and hard work avail the newly elected Council ought to succeed in restoring healthy vitality to the Society. There has been more downright hard work and careful sifting done during the last three months or so

FIG. 52.—CARYOTA SOBOLEIFERA. (SEE P. 334.)

have an attractive appearance: the comparatively small quantity not only preventing the loss from bruising, but the fruits keep good several days longer, owing to the package relieving them from undue pressure, and allowing the air to get to them."

The question of an extension of profitable

fruit-culture in this country is one that is receiving much attention just now. The publication in the *Gardeners' Chronicle* of December 31, 1887, of the paper on "The Importation of Foreign Apples," read by Mr. R. DEAN at the Harpenden Apple Congress, was the means of the subject being ventilated in several of the leading

London daily and provincial newspapers; and public opinion is thus being prepared for the announcement of plans devised to be the means of diverting to the pockets of English fruit-growers a good portion of the sum now sent abroad. It is true that good market garden ground still commands a high price, which is

not to be wondered at, seeing how many hundred acres of the best market garden land in Middlesex alone has been devoted in recent years to the growth of houses. Let a line be drawn from Putney Bridge to Kew Bridge, and an examination on either side of the line will show that very many acres of some of the best land in the county have been swallowed up by buildings. Land cannot, from its nature, be increased in extent, and every acre taken for building, unless an equivalent area be found elsewhere, must lessen that under cultivation.

The times are propitious for the employment of capital and enterprise in the production of good fruit, excellent agricultural land, adapted by means of previously good cultivation for the production of high-class Apples can be obtained at moderate cost; but no time should be lost in acquiring it, for we think land has touched its lowest level of value. To grow fruit profitably, and in order to be unfettered by deterring clauses in leases, the cultivating occupier should also be the owner. Let a lesson be taken from our Transatlantic brethren; let similar enterprise, intelligence, persistence, and capital, be employed here, and a formidable rivalry will be established that must also, we believe, prove a gratifying success.

ROYAL HORTICULTURAL SOCIETY.—At a general meeting of the Society, held on Tuesday in the conservatory at South Kensington, MAXWELL T. MASTERS, Esq., M.D., F.R.S., in the chair, the following candidates were duly elected Fellows of the Society, viz., John G. Adams, F. Hayman, A. Lovesy, A. S. Montgomery, T. Y. Moore, William Podger, John Reid, W. G. Rowlett. It was announced that twenty-eight guinea Fellows, whose names had been received, would be proposed for election at an early date.

THE FELLOWS' COMMITTEE.—On the invitation of the Council this body met on Tuesday last to consider certain questions relating to the election of local secretaries, the affiliation of local societies, and the desirability of memorialising the Government to include horticulture with agriculture in the proposed new Ministerial Department. That the interests of the practitioner were considered may be gleaned from the fact that the meeting was attended by, among others, Messrs. COLEMAN, DOUGLAS, SMITH (of Mentmore), WILSMITH, and WOODBRIDGE.

THE EMPLOYEES.—It has been suggested that the occasion of vacating the South Kensington premises by the Royal Horticultural Society is one that should be taken advantage of to invite the *employés* of the Society at South Kensington and Chiswick to an entertainment, by way of expressing the sense of the uniform courtesy and attention which they have at all times shown towards exhibitors, the members of the committee, and others. Those employed at South Kensington in a subordinate capacity will have to leave the service of the Society, consequently upon the change of home, and it is stated that the *employés* at Chiswick have received notice to leave, although the order may not be enforced at present. Before they are dispersed it is thought they should be invited to a supper, and Mr. Richard Deane, Raneagh Road, Ealing, who has the matter in hand, will be pleased to receive the names of gentlemen who would be willing to co-operate by forming themselves into a committee to carry the proposal into effect.

"KEW BULLETIN."—The first article in the March number refers to the produce of *Forstera gracilis*, an Apocynad found by Mr. JEXMAN to yield a description of Caoutchouc—most favourably reported on by Messrs. SILVER. Should this favourable verdict be confirmed by further experience, the resources of British Guiana will have received a notable addition. Other

articles relate to Patchouli, various West African Indigo plants, the culture and fertilisation of Vanilla, *Streblus* paper, the produce of *Streblus asper*, a plant grown in Siam. An interesting account of the manufacture of the paper, and the uses to which it is put is given. *Urera* fibre, produced from a Nettle-like plant, native of Natal, comes in for a notice, as likely to be serviceable in the same way as Rhea fibre. Jamaica is likely to enter the lists as a Tea-producing island, the early experiment with plants sent out from Kew having proved very satisfactory.

AGRICULTURAL PRODUCE STATISTICS.—The quantity of Wheat produced in 1887 in Great Britain was more than 74 millions of bushels, as compared with 61 millions in 1886 (fractions of a million are omitted); the average yield per acre in 1887 was 32 bushels, against 26·8 bushels per acre in the previous year, showing a total increase of 12,854,849 bushels, or nearly 21 per cent., and an increase in the yield per acre of 5·18 bushels, or over 19 per cent. The seasonal characters were a cold, dry spring, followed by hot dry weather, so that not only was the quantity large, but the quality also, the average weight per bushel being 63–64 lb. Straw was short. Barley was below the average, and Oats still more so. Pulse crops were greatly below average. Potatoes were rather more productive than in 1886. Mangels were considerably below average, as was also hay. The full tables whence these particulars are taken will be found in the *Agricultural Produce Statistics of Great Britain*, which may be had for 5s., from EYRE & SPOTTISWOODE, East Harding Street, Fleet Street, and which is a document of the highest interest to cultivators.

STOPPING VINE SHOOTS.—In the *Bulletin d'Arboriculture* M. PYNÆERT, alluding to the common practice of stopping the shoots at the second leaf above the bunch, says that in the vineries at Manage in Belgium, an interesting experiment has been made. In a span-roofed house in which fifty to sixty Vines are growing: those on one side of the house had been pinched-in to the second leaf beyond the bunch, while on the other side of the house the shoots had been allowed to attain a length even of 6 or 7 feet. The bunches on the Vines where the shoots were allowed to extend unchecked were quite as good as those on the pruned Vines, and, moreover, they were three weeks in advance of them—a point of the greatest moment in Vine forcing. M. BEUVENICH confirmed the statement of M. PYNÆERT. It is greatly to be hoped that some one will try this experiment here. The vineries at Chiswick offer excellent opportunities for carrying out such an experiment and at no pecuniary cost. Will the Chiswick Committee of the Council kindly note?

BOTANY.—The "Smart" Studentship of Botany at Caius College, Cambridge, is about to be awarded. The studentship is open to all members of the University who have taken honours in the first part of the Natural Science Tripos. The student is to apply himself to original investigation in botany, or to forfeit his studentship. The studentship is of the value of nearly £100 per annum. In former years we had too much cause to regret the almost exclusive addiction to systematic botany in this country, to the neglect of physiology more particularly. Things have changed, and it is morphology and systematic botany that now need encouragement—a fact which the awarders of prizes and studentships will do well to recognise.

"GARDEN AND FOREST" (a Journal of Horticulture, Landscape Art, and Forestry).—Such is the title of the new horticultural journal issued in New York, under the auspices of Professor SARGENT. First numbers are proverbially bad examples of what is to follow: but proverbs are very far from being always true. The general impression that the new venture makes upon us as we glance at its contents is, that it is permeated with a spirit of knowledge and refinement. Forestry and landscape garden-

ing naturally occupy much attention. An extraordinary picture of an extraordinary *Chrysanthemum* leads off the illustrations; the flowers are white, and the florets covered with glandular hairs, which give them a remarkable appearance. Dr. MAYN contributes an article on the Weymouth Pine, called White Pine in America, in which it is said that no Conifer in Europe can be cultivated with so little care and risk as the White Pine; the frost does not injure the young plants, and the numerous insects invading European trees during their whole lifetime inflict but little harm. How far this relative immunity from insect harm holds good with old trees we do not know, but we fancy that young trees of the *Strobilus* section are peculiarly liable to the attacks of American blight (*Schizoneura*). It has been with great concern, that we have heard of Professor SARGENT'S recent illness. The appearance of his new journal is a good omen, and we heartily wish sound health to the Editor, and a full measure of prosperity to his paper.

"A BOOK OF DOMESTIC POULTRY."—This is a clearly written, common-sense production, which we commend to the attention of our readers. It is written by the Manager of the Blanchworth Poultry Farm, Dursley, Gloucestershire. The great secret in poultry-keeping is to procure birds that are healthy, and to keep them so. Many people are much too negligent in the matter of cleanliness and sanitary precautions, forgetting that the birds are not wild birds in this country, and are therefore not able to withstand evil influences and unhealthy conditions as wild birds can. The method of giving food also requires judgment, which is too rarely exercised. Not only cottagers, but villa gardeners in the suburbs, require also to be cautioned about the localities in which they allow their birds to stray, and the food they give them. Eggs strongly flavoured with Onions are not agreeable, but they are not uncommon. When the Manager issues another edition of his useful book, it may be well for him to consider whether the insertion of marginal advertisements on each page will not be resented by the reader as impertinent intrusions, and tend to repel rather than attract him. Advertisements are excellent things in all ways, but they should be kept in their proper place.

COMPARATIVE ANATOMY OF FLOWERS.—The Rev. Geo. HENSLAW has lately contributed to the Royal Society a paper on this subject, and specially on the vascular cords or "axial traces," which often give a clue, by their nature and arrangement, to the real construction of a flower, which is otherwise undiscernible. Exception may, perhaps, be taken to Mr. HENSLAW'S statement that the cords are floral units, giving rise to axes as well as to all kinds of floral appendages, inasmuch as the organs are often sketched out, as it were, in cellular tissue long before any trace of vessels can be seen in them. The true nature of things in cases of concrescence or inseparation of parts which ought, but do not become detached from one another, is often capable of explanation, as Mr. HENSLAW points out, by the examination of the vascular bundles. We await with interest the publication of the paper as a whole.

"FLOWERLAND."—This is styled an introduction to botany for children, and for the use of parents and teachers. It is the work of the Rev. ROBERT FISHER, and is published by HEYWOOD, of Manchester. It is meant to be used with the flowers in hand, and is very simple, and well adapted for its purpose.

"FLORAL TEA-KETTLES."—These, says the *American Florist*, "are getting to be quite the correct style of decoration for afternoon teas. A very pretty one, sent out by FEAST, New Year's week, had the spout formed of Marie Louise Violets, the body of white Camellias with a band of magnificent "Benetts," and the handles of Smilax (asparagus), La France and Mermet Roses. Another, for a pink tea, was made entirely of pink Roses, and was hung

from a tripod covered with *Asparagus plumosa*." Oh! how quite too awfully lovely!

SUCH IS FAME—We extract the following from the *Queen*—the italics are our own:—"The death is announced of the American lady botanist, ASA GRAY. She was elected in 1878 by the Paris Academy of Sciences as its corresponding member."

THE FROST.—In the Banbury district during the past few weeks very wintery weather has been experienced, very deep snow, and as much as 19° of frost. It is singular to note that while there has been a heavy snowfall within 40 and 50 miles of London, and even nearer, a large area of which London forms the centre, has been visited only by light showers of snow.

THE SEVERE WEATHER IN CORNWALL.—Mr. C. LEE, gardener at Boconnoc, writes:—"Since February 13 the weather has been unusually cold for this county. 11°, 13°, and 15° of frost have respectively been registered. Spring flowers, such as *Myosotis*, variegated *Arabis*, *Limnanthes*, *Brompton Stocks*, *Wallflowers*, *Lenten Roses* (*Helleborus olympicus* and its varieties) are blasted, the flowers all drooping to the ground, some of these being quite dead. *Rhododendron Nobleannum*, that was in full bloom on January 28, has all its flowers and prominent buds killed; *Czar Violets* that were flowering freely are spoiled, even those that were in vases were found to be encrusted with ice. Kitchen garden crops have a scorched appearance; Cauliflower plants planted at the foot of a south wall have escaped, and I am glad to see that the Broccolis have withstood the frost so well. I never recollect seeing so many dead redwings, unless much snow had fallen. I suppose, being short of food, they could not endure the freezing north-east wind. At Camborne the weather was very severe, with strong cold winds, and accompanied by a light fall of snow. Work was stopped at the tin streams owing to the ice, and, what is a most unusual occurrence in West Cornwall, water drawn for domestic purposes was found with a thick coating of ice. At Falmouth, Penryn, St. Austell, Truro, and St. Ives such severe weather has not been known for many years; the favoured valley of Penzance has not altogether escaped, but the frost there was of short duration."

DEVIZES CHRYSANTHEMUM SHOW.—The usual exhibition is announced to take place on November 13, in connection with the annual Bazaar in aid of the funds of the Benevolent Society, the proceeds of which go to the relief of the poor during the winter. The show is under the management of Mr. THOMAS KING, The Castle Gardens, Devizes.

ACACIA DEALBATA.—M. ANDRÉ records in the *Revue Horticole* the practice followed by the Provençal gardeners to hasten the flowering of this shrub, branches of which are at this season so largely sold in the flower shops. The branches are cut when the flower-buds are well-developed, the cut ends placed in water, and the whole branch placed in a warm place. By this means the normal period of flowering is accelerated by one month, and the price obtained correspondingly enhanced. Thus the forced blossoms fetch a price of 3-4 francs the kilogramme, instead of about a franc per kilo (or 4½d. a pound).

COPYRIGHT IN SEEDLING FRUITS.—In the *Garden* of February 18 Mr. T. F. RIVERS raises a question of no little importance—one which a regenerated Horticultural Society might deal with. Mr. RIVERS complains, with some justice, that two seedling Plums, which are likely to be valuable additions to the home fruit markets—The *Czar* (T. F. RIVERS) and The *Sultan* (T. F. RIVERS)—are mentioned without his name being appended. These two Plums, according to Mr. RIVERS, "from the arrangement of their parentage, their fructification and the responsibility of making them public, are entirely my own. If I had a right of copyright, to which," continues Mr. RIVERS, "I contend I am entitled,

I should not only now be reaping a handsome income, but I should be able to employ nearly all the land and labour in my parish for growing trees, as it has been admitted that these early Plums have enabled the English grower to compete successfully with the foreign fruit grower."

ASA GRAY.—The *Pharmaceutische Rundschau*, a German pharmaceutical journal published at New York, contains a sympathetic account of the life and labours of this great botanist, of whom it is said in the words of BRYANT, that—

"Sustained and soothed
By an unflinching trust he approach'd his grave
Like one who wraps the drapery of his couch
About him, and lays down to pleasant dreams."

THE DUKE OF NORTHUMBERLAND'S NEW COTTAGES FOR HIS WORKPEOPLE.—The Duke of NORTHUMBERLAND has just erected, near to the entrance to the gardens of Syon House, at Brentford End, a set of six new cottages for the workpeople. They are models of what cottages should be, and in their solidity, finish, and regard for the comfort of the inmates stand out in marked contrast to much of the cottage property run up in the present day. Each cottage has four good living rooms, with excellent back offices; they are substantially built at a cost far beyond what is expended on similar buildings in the present day. In the middle of the row is a common passage, which, running until it reaches the termination of the back offices, branches to the right and left at a right angle, and continued until it reaches the back yards of the two end houses. Beyond this passage, running athwart the block, is a nice piece of walled-in garden, with the ash-hole in each. The yards, &c., are all asphalted, and the drainage perfect. An objection is sometimes lodged against housing the poor in good cottages, that they fail to appreciate improvements in sanitary arrangements. The Duke of NORTHUMBERLAND appears to be one of those practical philanthropists who believe that until the poor are well and comfortably housed they will not improve in their habits of living. These cottages have been erected under the active superintendence of Mr. J. WOODBRIDGE.

HARRISON WEIR.—The jubilee of the genial artist's working life has lately been celebrated. As HARRISON WEIR is not only a sympathetic and facile artist, but a good gardener, the following extracts, taken from the *East Sussex News*, may be read with interest:—

"He was among the first to give those faithful representations of birds and animals which lent such a charm to the books of our early days, thereby helping very materially to mould the mind to more thoroughly appreciate the beautiful in Nature and Art. A well drawn picture speaks to every mind, however youthful or illiterate, hence its great advantage as an educational medium. Fifty years last December he left school to make his mark in the world and that he has done this thoroughly and well cannot be doubted. Hard work it doubtless has been during this long period and frequently laborious in the extreme, as all his productions were of necessity the result of personal effort. Mr. WEIR may be looked upon as the pioneer of really good illustrations in popular literature, a branch of art which has now reached a high state of perfection. His ready pen and graphic pencil have ever been on the side of humanity, pointing out in a most charming manner the instincts and beauties of animal life. His skilful delineations have advanced the cause of humanity far more than all the prosecutions of the Royal Society for Preventing Cruelty to Animals. HARRISON WEIR's great aim has been to engender a love for the brute creation and thereby provide at the same time the true remedy against cruelty and an ennobling and pleasurable interest in animal life. Apart from artistic success he has gained honours and prizes with poultry, pigeons and fruit. At the present time he is on the Fruit Committee of the Royal Horticultural Society. Although long celebrated as a judge of poultry, on the points of the fancier, he contends that poultry shows are comparatively a delusion and that we are giving up delicacy and quantity of flesh for pecu-

liarity of plumage, eccentricity of build, &c. We learn that he is engaged in preparing more books for publication, one being entitled, *The Domestic Cat*, another on birds, having already published *Every Day in the Country*, *Animal Stories Old and New*, and *Bird Stories Old and New*, the last being, as he quaintly puts it, his Jubilee book, it being issued for last Christmas, and of it 10,000 copies were printed. Mr. WEIR's efforts have been recognised in many ways beyond their mere money value, and he has many pleasing mementoes of past efforts. He prides himself on having originated cat shows. The first venture of this kind resulted in a large profit, and the directors of the Crystal Palace Company presented him with a very handsome Silver Cup in honour of the event." Lately Mr. WEIR, with his usual versatility, has entered the ranks of journalism, and we may add with his usual success. Long may he continue to add lustre to his varied professions.

CHRYSANTHEMUM SHOW FIXTURES.—The annual exhibition of the Kingston and Surbiton Society is fixed for November 6 and 7, that at St. Neots on November 12, the Bournemouth and District Society's Exhibition on November 14, the Hull and East Riding on November 22, and Winchester on November 13.

ROSE SHOWS IN 1888.—In addition to those announced at p. 306, there are the following:—June 28, Brockham and Ryde; July 4, Richmond, Surrey; July 11, Ealing; July 14, New Brighton; July 21, Manchester.

PRESTON AND FULWOOD HORTICULTURAL SOCIETY.—This Society deserves the thanks of its members for the publication of the valuable papers presented to it. In the report before us are papers on Bulbs, on the Orchid Culture, and on Ferns, by Mr. SWAN; on Rose Culture under Glass, by Mr. PAYNE; on Vine Culture, by Mr. WATERS; on Bees, by Mr. MOSS; Tuberoses Begonias, by Mr. SPELMAN; and on Manures, by Mr. HEYTON.

TRADE NOTICE.—Mr. W. E. DIXON desires us to state that letters addressed "Lawson Seed and Nursery Company," either with or without "Manager," find their way to the liquidators. Correspondents who may wish to address him privately must send to Bangholm House, Edinburgh, and on business to The Lawson Seed and Nursery Company.

PUBLICATIONS RECEIVED.—*Colonial and Indian Exhibition Reports on Trinidad Exhibits, with further Notes thereon*. By J. McCARTHY, F.I.C.; and J. H. HAER, F.L.S. (Port of Spain, Trinidad: Government Printing Office.)

CULTURAL MEMORANDA.

ACACIA LOPHANTHA.

The graceful habit and Fern-like foliage of this plant renders it a very desirable subject for decorative purposes. Soak the seeds for a few hours in warm water before sowing in a small pan or 6-inch pot filled to within an inch of the rim with ordinary potting mould. Cover with half an inch of soil, and place in a hotbed or any warm structure that may be at command. When the seedlings appear, if not already occupying a position near to the glass, give them such. When about 2 inches high pot off singly into 3-inch pots, returning them to heat for a week or two, giving water at the roots, and shading from sun for a few days, subsequently shifting the plants into 4½-inch pots; later on shifting all the strongest plants that are likely to fill 6-inch pots with roots before the end of September into that size pots, growing the plants on during the interval in a frame, pit, or on the shelf or kerb in the greenhouse, giving water at the roots when necessary.

TRINBERGIA ALATA.

Plants of this handsome half-hardy annual are very effective either as pot plants or for covering a

pillar or wall in a greenhouse or conservatory during the summer and autumn months. It may also be used for the same purpose out-of-doors in a warm situation. The flowers are either white, buff, pale yellow, or orange with a purple-black centre, or uniformly orange or white. Sow the seed at once in a pan or 6-inch pot filled to the rim with light sandy mould, cover lightly, and place in heat. As soon as the seedlings are large enough prick them off a couple of inches apart, put back in heat, give water, and shade from the sun until the roots have pushed into the soil. From three to five plants placed in $4\frac{1}{2}$ -inch, 6-inch, and 7 $\frac{1}{2}$ -inch pots respectively—using a compost of three parts good loam and one of sifted manure from an old hot-bed, with a sprinkling of sand added, watered and grown on in a pit or greenhouse—will in a short time grow into useful furnishing plants. They must be kept well supplied with water at the roots and overhead, otherwise red-spider will ravage them.

BRUGMANSIA SUAVEOLENS.

This fine greenhouse plant is of easy culture. It produces drooping, fragrant, yellowish-white flowers, nearly a foot in length, and of a tubular form, with bell-shaped mouth. It grows well in a mixture of three parts good fibry calcareous loam and one of leaf-mould and sharp sand. Cuttings taken off now and put in singly in 3-inch pots filled with light sandy mould, plunged in a hotbed, watered, and kept close and shaded from the sun during the hottest part of the day, will soon take root and start into rapid growth. The little plants should then be given more room at the roots and a less warm temperature in which to grow, keeping them moist at the roots, and damping them overhead on bright afternoons, to keep the leaves free from red-spider. About the middle of June set the plants out-of-doors in a warm situation, 18 inches apart, putting some soil of the description indicated about their roots to grow in, potting them up early in September. Meanwhile they should be attended to in the way of pinching the shoots two or three times, and keeping them well supplied with weak manure-water at the roots, and syringing overhead every afternoon in the absence of rain. *B. sanguinea*, having reddish-crimson flowers, is also well worth growing.

THE HARDY FRUIT GARDEN.

DOUBLE GRAFTING PEAR TREES.—To carry this out in a systematic manner, trees should be selected which are either budded or grafted on the Quince, and the two following varieties, being strong growers, are admirably adapted for the purpose, viz., *Beurré Bachelier* and *Beurré Diel*. These will be found excellent trees on which to graft the finer flavoured Pears, especially those that grow indifferently when grafted directly on to the Quince stock. The growth they make when double grafted is much more robust, the fruits are larger, and the flavour is much improved. On the other hand, there are many varieties that do grow well on the Quince, but the flavour of the fruit being merely passable they are greatly improved by being double worked. It is remarkable how double grafting influences, and in some cases changes, the character of the fruit, two notable examples being *Althorpe Crassane* and *Beurré Superfin*. In the first case the size of the fruit is much increased, and becomes more round in shape; in the latter case the fruits are more like *Marie Louise* in shape, the colour a deep reddish-brown, and the flavour peculiarly rich and refreshing. There are other varieties which show the same differences; *Knight's Monarch*, too, when grown in this way, does not show the tendency to shrivel when kept, which is a characteristic of that variety. In referring to this subject last week I mentioned that any one possessing good healthy Pear trees, &c., and I would recommend that the trees should now be cut back and made ready for grafting. Should the trees that are to be operated upon be cordon trained, cut them down to within a few inches of the stock; if pyramids or bushes, reduce the number of branches to about seven or nine, and leave these about 6 or 7 inches in length, so that when the grafts begin to grow the tree will quickly form a good head again, and in the case of fan, or vertical trained wall trees, cut the branches

off to within a sufficient distance from the stem so that the grafting can be conveniently performed. There are various ways of grafting fruit trees, but that designated whip-grafting is the method generally practised, and the one most suitable for this purpose.

The following is a short list of varieties of Pears suitable for double grafting. The first eleven named are for grafting on trees already on the Quince stock, and the remainder for trees that are on the Pear stock:—*Summer Beurré d'Aremberg*, *Beurré de l'Assomption*, *Thomson's Beurré Superfin*, *Marie Louise*, *Doyenné du Comice*, *Knight's Monarch*, *Dana's Hovey*, *Althorpe Crassane*, *Beurré Rance*, *Bergamotte d'Esperen*, *Souvenir du Congrès*, *Madame Treve*, *Beurré Hardy*, *Brockworth Park*, *Pitmaine Duchess*, *Forelle*, *Glou Morçeau*, and *Josephine de Malines*. *Catillac*, grafted on the Swan's Egg, always bears enormous crops of fine fruit. *A. Ward, Stoke Edith Gardens, Hereford.*

USEFUL INVENTIONS.

THE DOUBLE-POINTED NAIL.

This appears likely to fulfil a want that has been long felt, viz., that of being able to fasten boards, &c., together without the means by which the work is done being visible. The nail, says the inventor, renders any wooden fence perfectly unclimbable. It is as formidable as a bayonet, and cannot be masked by a sack or coat as can the ordinary tenter-hook. They are also valuable for forming teeth in rakes, harrows, &c. It is well known that in putting up woodwork the nail-holes always show, and no kind of putty has yet been made that will hide the holes. Various means have been tried to obviate the use of nails for the best kinds of work, but nothing as inexpensive and so effective as this device has been found. It will be seen that it is double-pointed, with the hammer-head, *A* (fig. 53), placed about its centre, with a chisel-edge *n*, immediately underneath it; the reverse sides are parallel, to prevent splitting the wood. The nails are driven into the wood flush with the outside of the head, *A*, the chisel-edge and shoulder readily entering the wood (see fig., p. 341). The piece to be attached is placed in position, and blocked down, when the nails will enter into the substance and securely fasten it invisibly. The nails are made in various sizes to suit the finest cabinet-work and joinery of all kinds, to the heaviest work in carpentry, ship-building, &c.

The nail is the invention of a lady, Mrs. E. Durraus. It is stated that the nails are only half the price of tenter-hooks.

HOME CORRESPONDENCE.

VEGETABLE GARDENS.—While we read of snowstorms and general wintry weather in parts far south from our own locality, we are able to look out on green herbage which has not been entirely snow-covered during the whole winter. Nevertheless, we admit that snow often comes as a "welcome visitor" when frost is severe, to act as shelter for vegetation in general. Mild as the winter has been (compared with past seasons), such crops as Spinach and Cabbage are severely nipped, but Rosette Coleworts are safe and sound and little models ready for use—the winter has been exceptionally favourable to the trenching and digging up of ground preparatory for seed sowing, and many will now be ready to take the first opportunity of getting in the main crop of Onions and Parsnips. These both require deep soil to allow the roots free course downwards; but Parsnips are not benefited by extra rich soil, and do well on land which is in good order after being cropped the previous year. Onions do best in strong ground, rich, and made firm before sowing the seed. This bulb has special attention among competing cultivators, and much pains is taken to get a good start with the sowing of seed. Dustings with soot afford a good stimulant for giving health and vigour to Onions, but probably of more value as a check to vermin,

which are often so troublesome to young Onion crops. A great deal of mischief is done to Onion crops by sowing the seed into battered soil, which (when the ground dries) imprison the seed and the seedlings come through weakly and are a ready prey to grubs. While firm ground is recommended, that does not mean making the surface impervious to air, by treading the surface when wet, indeed, if the firming has been done before sowing there is not much good in rolling or treading afterwards, while old gardens are much improved by turning into them quantities of fresh soil, or by raising up a small portion of the subsoil to sweeten the surface, which does much to improve the crops, and the turning down of the soil abolishes much of the seed of weeds, and destroys vermin. Errors are, however, often committed by turning up much of the inert or tenacious subsoil, which causes much labour and some disappointment for one season at the least. The injudicious system of bringing large masses of subsoil to the surface has done much to check the commendable practice of deep trenching. Those who are forming new vegetable gardens should be cautious not to fall into the error indicated. It is very general to trench well at first, and we have known it done "too well." Depth of fertile land and the nature of subsoil should be the guide taken in dealing with the staple of new gardens; it is enough, if a clayey subsoil be well turned over at bottom and broken. The position of the vegetable garden is not always skillfully chosen, and is often quite the reverse. To appear well on a plan is often the first consideration, and when such is adhered to—irrespective of the perhaps unpleasant proximity of the dwelling-house, or the disfigurement of the landscape—the view of huge brick walls as prominent objects of a demesne is far too common. Such aids to fruit growing might often be exchanged for glass erections, which are sure to give good returns under intelligent care, and be of much service also as protectors. These houses are of special value in the northern parts of the country, and where such are in use they are generally found to afford much satisfaction. At the present season Parsley, Lettuce, Broccoli, Endive, young Peas, and many other items are sheltered in cool houses, which would otherwise entail much labour and untidiness if preserved in the open ground. The protection of plants used in the forcing department and for vegetables, apart from fruit culture in these structures, pays good interest to proprietors. *Caledonian.*

HELLEBORE CULTIVATION.—During the past few weeks I have been much interested in the discussion upon Hellebores, and although the treatment recommended is rather perplexing, still I think that with a little consideration anyone with a fair amount of common sense would have no hesitation in arriving at the proper course to adopt. For instance, if the object is simply to move the plant from one locality to another, my plan would be to lift it with as much soil as would adhere to the roots. Again, if the object was to increase the stock, washing the roots would of course be more expeditious, and would be accomplished with less injury to the roots than if covered with soil. We have a plant of *H. niger* major which was purchased three years ago from Mr. Stamp at Bishoptington, Devon, as an extra clump; after being planted one year it was found necessary to remove it to a distant part of the garden. This was done at the end of March, and with as much earth as possible. The plant received no check, and has this season produced between 450 and 500 fully developed blooms, and is a mass of leafage. I simply cover with a common garden frame. The soil here, I may add, is a rather light loam, on the limestone formation, which gets rather dry in summer, necessitating abundant supplies of water, which, in the case of the plant in question, was diluted drainings from the cowsheds. *W. Beswick, Beshborough Court, Cork.*

ROYAL HORTICULTURAL SOCIETY.—If the Society is to continue to exist, it is in my opinion absolutely necessary that it should have a London office easy of access in some central position. It is also necessary that the Society should endeavour to induce horticulturists to join, in order that funds may be provided for the maintenance of Chiswick. I believe it will be advisable to have a few meetings in the summer at Chiswick, to give persons who reside near the gardens an inducement to join the Society. I think it will prove good policy to have some place nearer the City than either South Kensington or Chiswick to hold the fortnightly shows. Although the Drill Hall, near Victoria Street, may

not be the thing that could be wished, nevertheless it is close to the Army and Navy Stores which large numbers of people frequent. I shall be much disappointed if sufficient gate-money is not taken to at least pay the rent of the hall, provided the trade support the Society by exhibiting the plants of their establishments. I expect to be told that gate-money at South Kensington was a failure, but it must be remembered that during the Colonial and other Exhibitions the Society did not charge for entrance. If £50 can be obtained, a sum which I have known to be taken as gate-money in Finsbury Circus for the exhibition of a few sickly plants grown in the City, surely the Council may reasonably expect to take £200 during the whole year from the shows at Westminster. *A. H. Smees.*

GUINEA FELLOWS OF THE ROYAL HORTICULTURAL SOCIETY.—The Council of the Royal Horticultural Society has now determined that in addition to the £4 4s. and £2 2s. Fellows, and 10s. 6d. Gardener Associates, they will admit as Fellows, with a vote, ladies and gentlemen paying a subscription of £1 1s. For many years past I have believed that this would give the means of resuscitating the Society, and of placing it on a broad and sound basis. The owners of gardens all over the country are the natural supporters of a Society by whose action the flowers, fruit, and vegetables which they grow are improved, and if the facts of the case were fairly brought before them they will join the Society. I am to some extent pledged to be the means of bringing in 500 guinea Fellows within a year, and I mean to do this; but it will require the aid of all my friends, acquaintances, and gardening connections; of these last, especially of some of the visitors to our experimental garden at Wisley, I have not the present addresses. Will you allow me to reach those who read your paper by its means, and to say that I think our best course will be to make a committee for the purpose of finding suitable Fellows—a committee which, formed for a single purpose, will involve neither attendance nor expense nor liability, and to request that any lady or gentleman disposed to join this committee will communicate with me at the above address? *George F. Wilson, Heatherbank, Weybridge.*

FRUIT TREES.—I hear of these being unusually forward in some parts, but it is not so in my own locality. Apricots are barely showing colour yet, and all other wall trees appear to be at present, and good crops of fruit may reasonably be expected on trees which have been rendered fruitful by good cultivation. When fruit trees are yearly loaded with flower-buds, which seem to expand well, but no fruit rewards the grower, it shows that something should be done to restore fruitfulness. If root lifting has been neglected we would not let even this season pass without attempting a remedy. Though skilful men do this in autumn it is better not to lose a season by neglecting the work entirely. I have root-pruned and partially lifted fruit trees during every month of the year, and have had no reason to regret the labour expended; certainly one cannot expect more from the trees so manipulated the first season than the formation of fruit-buds for the next year. Reverting to abundance of flower-buds minus fruit, it often happens that fruitfulness would be certain were it not that the buds are so crowded that they cannot set properly because light and air cannot reach the stamens and pistils of the flowers, than which nothing is more certain to prevent setting. It is well to practise systematic thinning of fruit-buds, leaving them clear of each other. Those at the back of the shoots next the walls are better all taken off, and were it not that shelter is had from the young wood growths I would thin them also as soon as they are discernible. Under glass we pick them off, leaving only those at the base of the shoots and at top to draw up sap. They never feel a check from this practice. *E. Ward.*

SOLOMON'S SEAL.—It may not be generally known that the juice of the root of this plant is an excellent remedy for removing discoloration of the skin caused by bruises when the latter is not broken. [See what old Gerard says on this point!] Procure a piece of root any size, pare away the skin down to the flesh, and rub the juice from the root on to the discoloured skin several times, each time cutting off a slice of the root to procure a further fresh supply of the juice; repeat the application three times a day until the desired effect be obtained. In some places Solomon's Seal grows wild in the woods, and a stock of plants may be procured for forcing in a simple

manner. During September, just before the foliage drops off, dig up the roots 4 inches long, potting them, say, five in a 6-inch pot, in fairly rich soil, standing the pots in a cold frame until required for forcing. About two months is required to have the plants in flower in a temperature of about 55° by night, with a rise of 10° by day. [One month will suffice, in our experience. Ed.] Abundance of water at the roots is an advantage to the plants while growing, but if the water be at all impregnated with chalk or other deposit the plants will be the better for not being syringed. After flowering, the plants should be placed in a cold frame for a time until thoroughly hardened off, when the roots should be parted, planting each piece singly in rows on a west border, allowing sufficient space for the full development of the leaves. The roots should remain here until the following October twelvemonths, when they may be again taken up and potted. *S.*

SCILLY.—Narcissus in great numbers are in bloom in the open air in the Isles of Scilly. The season began in the second week in February, and will continue for some weeks longer. The varieties include all the older ones, and a few of the newer species and hybrids. *J. C. Tonkin, Isles of Scilly.*

FIG. 53.—DOUBLE-POINTED NAIL (SEE P. 310.)

AUCUBAS IN BERRY.—As decorative plants for embellishing cold structures during the winter months Aucuba stand in the front rank. The Aucuba, with berries or not, has no equal as a plant for cold entrance halls, being far superior to the Skimmias, which have dull red berries, whilst these are bright as coral. Aucubas in berry are excellent for filling window boxes, and look well when intermixed with *Retinospora plumosa obtusa*, and *pisifera*. Every one has the means of producing Aucubas with berries by placing in proximity to each other the male and female varieties of the plant, which can be purchased at a cheap price at the nurseries. In some nurseries large breadths are thus grown for the purpose of obtaining plants of all sizes well furnished with berries, the variety chiefly grown being that known as *A. vera*. A fully furnished Aucuba, nicely grown, and in a small pot, is a not undesirable object for the dinner-table. I remember on the occasion of a visit to Bearwood, Berkshire, a few years ago, Mr. Tegg drew my attention to a long hedge in the frame ground of Aucuba vera, literally covered with berries, and I was told that it fruited in this way every season. *Pro.*

BEE FLOWERS.—By these I mean flowers from which the bees can derive honey or pollen, or both. The first genial sunny days of spring bring them forth in quest of the nectar the early flowers afford. The Crocus is much sought for by bees, as they derive both honey and pollen from the blossoms. I have a permanent border of Crocuses, and on a warm sunny March day, when the flowers are fully expanded, a large number of bees can be seen at work among them; the hum of busy insect life is pleasant to the ear. The Snowdrop yields honey and pollen both; the inflorescence of the Willow also furnishes pollen, and that of the Elm likewise. The Wallflower, Aubrietia, and Almond largely attract the bees, and so does the common Dandelion of the wayside. The Peach, like

the Almond, supplies pollen and honey both; the Nectarine also, and the Plum, Cherry, Pear, Apple, Gooseberry, Currant, and Chestnut. The latter supplies a crimson pollen, for which the bees appear to have a great liking. The sweetness of the blossoms of the Lime yields much honey; so do the crimson flowers of Sainfoin and *Trifolium incarnatum*. Bean blossoms have a great attraction for bees, so have the blossoms of the Mignonette and the Viola. Anyone can see the bees busy at the white Dutch Clover, and it ranks high in the opinion of the apiarist; and the same can be said of the common Melilot Clover, which is found to impart a most agreeable sweet scent to a crop of hay; and cattle enjoy it greatly when cut in a young state. The Hollyhock and Hawkweed also furnish supplies, the Buckwheat especially so, Sage, Mint, and Borage supply honey; so also does the common Heather in abundance. It is said bees will go a long way in search of this. I can well remember, many years ago, one who had studied closely the habits of bees, stating they would fly across the Southampton Water in search of Heather in the New Forest. *Limnanthus Douglasii*, single Dahlias, the Sunflower (chiefly pollen), the Golden Rod (*Solidago*), Alsike Clover, the Scabious, and all Cruciferae, especially Cabbage and Rape, are also useful honey producing plants. *R. D.*

MUSHROOM CULTURE.—What I now state may be of some interest to gardeners. I have frequently observed that writers on Mushroom growing advise old spawn to be thrown away. This year I made up a bed in the middle of January, and have been picking Mushrooms from that bed for more than a week, and the material was not in the best order when made up, for, shed-room not being at command, it was, owing to snow and rain, very wet. I made up the bed notwithstanding, mixing the dung of the old spent bed with the new materials; and when at the proper heat for spawning I used spawn that was two years old, and which was very dry, and nearly as hard as a board, having lain on a shelf in one of the stoke-holes. This is not the first time I have had success with old spawn. *G. H. Merton.* [The large "buttons" seen were fleshy, solid, and showed no evidence of having been unduly forced. Ed.]

SNOW AS A PROTECTOR.—I always rejoice when a fall of snow comes between a time of rain and one of sharp, stinging frost. During the frosty time that ushered in the New Year I placed some light litter over certain things in the open ground, which, though hardy in themselves, are yet liable to danger in a somewhat stiff and retentive clay, and they never seem to me to be so secure as when covered by a pall of snow. I find from experience with a moist soil that it is when kept frost follows sharp upon rain that the greatest amount of damage is done. But the snow is a valuable protector, covering up everything snug and warm, and out of reach of danger. A dozen plants of *Agapanthus umbellatus* planted out under an east wall came safely through the rigours of last winter with only a covering of snow—not a plant was lost. "He giveth snow like wool" is a truism, for it is not only soft and white when it falls, but it keeps anything that it covers protected from the outside cold. I go a step further, and as soon as the snow has fallen, and before it becomes hard and frosty, I shovel it up from the walks and add to the covering lying over anything I am desirous of protecting, and when the thaw comes, if the leaves have become a little crushed they soon recover. I think the snow makes an excellent covering for cold frames also, and when a fall is imminent I take off the covering (if any) on the frame, and the snow takes its place, and if it melts through the action of the sun, I add more from that lying round the frame. *R. D.*

BEGONIA LUBBERSII.—I was particularly struck with the appearance of the Begonia as figured in last week's *Chronicle*, as I think I recognise in it what was introduced as a species from Brazil in 1819, under the names of *B. argyrostigma* (Fischer), and *B. maculata* (Raddi), a beautiful foliaged plant, answering in every detail to the admittedly scanty description of *B. Lubbersii* in the accompanying text. I would not for a moment doubt Monsieur le Comte de Kerchov's observations, but your remark: "For the rest the illustration must tell its own tale," which seems to present to me no other than the silvery-spotted, smooth-leaved species, procurable at any of our leading London nurseries. Should I be mistaken I would be glad if your correspondent would point out the difference. *Mediocriter.*

DROPPERS.—It is now three years since in accidentally digging to plant trees in my wood at Edge, I came upon beds of *Scilla nutans* in various stages. With regard to the bulbs which you show on p. 277, and which you say developed in the box, I am pretty sure that only one, viz., the lowest, develops in the ground. I never could catch these just at the time they are descending from seed to mature (spheroidal) bulbs, a three or four years course. The bulbs descend 2 or 3 inches each year. What I wish to draw your attention to is that every seedling passes through the fiddle-shape stage the second (or third) year, but descend they do. *C. Wolley Dod.*

RAILWAY HOME RATES.—Many grievous charges are made against the railway companies, and published by the Press, without a word to explain that the charges are not to be taken as proved. When these charges are subjected to cross-examination, the residuum of truth is found to be remarkably small. I have read the reports on depression, including Mr. Flinn's evidence, and I may say that I have been astonished at the strength of the railway case in reply. Let any of your readers get the third report and read for themselves Mr. Flinn's evidence, and the evidence of others. Sir Thomas Farrer's remarks ought also to be noted. The rate on foreign grain from Hartlepool to Newark is necessarily based on the rates from nearer ports, such as Goole, Grimsby, and Hull. If the companies charged the same rate on foreign grain from Hartlepool as they do on home grain, the foreign grain would simply be landed at Grimsby, Goole, or Hull. From these places the companies are bound to carry it at a certain rate, the rate to Newark being 8s., while as you say from Hartlepool the rate is 9s. 2d. How would the home produce be benefited by the Hartlepool rate being cancelled? Again, it is said that the companies carry foreign goods at a less profit, and therefore must make up their half-yearly rate of profit by charging an excess on home goods. Suppose the Midland Railway has spent £4,000,000 solely in order to carry foreign goods, and the rest of its capital to carry home goods; if the £4,000,000 pay only 1 per cent., of course the other capital must pay an excess. If the Midland Railway has not spent anything solely in order to carry foreign goods, whatever percentage it makes on them will go to relieve the charges on home traffic. It should be remembered in deciding this question that every outlay by the companies has received the express sanction of Parliament and has been made on the faith of Parliamentary Acts. As to Mr. Tallerman, I can well suppose that he disposes of every difficulty in the way of railway regulation. By all means let us have everybody running trucks over the lines at his own sweet will. I presume the cost of compensation for accidents will be paid by the original owners of the property on which accidents occur. Terminals, again, are bitterly complained of, and by none more bitterly than by Mr. Marshall Stevens. Your readers may see in the third report what he says against the Midland Railway expenditure in Liverpool. I could not say, but I do not doubt that that expenditure was clamoured for and welcomed with delight by the Press and public. Every town is always "at" the railway companies for more accommodation. To turn round and denounce the charges made in consequence as illegal (terminals have repeatedly been sanctioned by decisions in courts of law) and new, and unfair, does not appear to me to be just. I am aware that the ease against the railways can be made to look overwhelmingly strong. It is necessary from the nature of their business, and I should like to ask parenthetically whose business could not be represented in an odious light? Take an instance mentioned by Sir Thomas Farrer. The Great Northern and Great Eastern carry foreign grain from London into the Eastern Counties at a slightly lower rate than they carry grain from those countries into London. Could not this be made to look like wanton mischief! Yet the explanation is rather creditable to the generosity of the companies. Take another instance mentioned by Mr. Grierson: "The rate on foreign Hops from Boulogne to London was 17s. 6d., and from Ashford on English Hops, 38s. It was, however, shown that owing to the made of packing 73 per cent. more foreign Hops than English ones could be put on a truck." The difference, however, was still great, and the companies cancelled the foreign rate. What was the result? Foreign Hops now are carried by the boats to London cheaper than before. It is easier to accuse than to defend, especially if the defence has to refer to the Blue Books and such treatises as Grierson on "Railway Rates." If the

question is to be understood, these works must be read; and even if the nation has decided to spare the landlord, and war down the miserable shareholder, the question might be understood. *W. M.*

SOCIETIES.

ROYAL HORTICULTURAL.

COUNCIL MEETING.

A meeting of the Council was held on the 13th inst., when the privileges to be given to the Fellows according to the rate of their subscription was finally settled. Nominations were received of thirty-six new Fellows. The Council interviewed several of the candidates for the Assistant Secretaryship, and after much deliberation determined to appoint Mr. Charles J. Grahame to the post. The agreement for the premises, 111, Victoria Street, was finally adopted, and the seal of the Society was ordered to be attached to it. Sir Trevor Lawrence, Mr. Thielton Dyer, Dr. Masters, and Mr. Veitch were appointed a deputation to wait on the Lord Mayor with reference to the projected show in the City of London this year. The bye-laws, as altered and amended by the sub-committee, were ordered to be printed and circulated before being presented for adoption. The following gentlemen were requested to act as an Exhibition Committee to draw up a programme for the present year—viz., Messrs. G. Bunyard, Barron, Douglas, Haywood, Laing, G. Paul, Rivers, Turner, Veitch, Walker, and Wildsmith, with power to add to their number. The Council will meet again on Tuesday, March 20.

GENERAL MEETING.

At a general meeting of the Society, held the same day in the Conservatory (Maxwell T. Masters, Esq., M.D., F.R.S., in the chair), the following candidates were duly elected Fellows of the Society, viz.:—John G. Adams, F. Hayman, A. Lovesay, A. S. Montgomery, T. Y. Moore, William Polger, John Reid, W. G. Rowlett. It was announced that twenty-eight guinea Fellows whose names had been received would be proposed for election at an early date.

SUMMARY OF THE PRIVILEGES OF FELLOWS AND ASSOCIATES FOR THE YEAR 1888.

A Fellow Paying Four Guineas a Year is Entitled—

1. To a family ticket admitting to all the Society's exhibitions and meetings at 12.30 o'clock, being an hour earlier than the general public.
2. Personal admission to all the Society's exhibitions and meetings at 12.30 o'clock, being an hour earlier than the general public.
3. To personal admission daily, between the hours of 10 a.m. and 5 p.m., to the Society's Rooms, and to the Lindley Library, except on Sundays and holidays.
4. To personal admission, between the same hours and with the same exceptions, to the Society's experimental gardens at Chiswick.
5. The privilege of sending fruit, flowers, and seeds to Chiswick for trial.
6. To a share of such seeds, plants, cuttings, &c., as the Society may have in sufficient numbers for distribution.
7. To purchase such fruit and vegetables grown at Chiswick as are not required for the purposes of the Society.
8. To a copy of all publications of the Society.
9. To the right of voting at all meetings.

A Fellow paying Two Guineas a Year is entitled—

10. To a transferable ticket admitting two persons to all the Society's exhibitions and shows.
11. To the same privileges as mentioned in Nos. 2, 3, 4, 5, 6, 7, 8, and 9.

A Fellow paying One Guinea a Year is entitled—

12. To personal admission to all Society's exhibitions and shows.
13. To the same privileges as mentioned in Nos. 2, 3, 4, 5, 6, 7, 8, and 9.

An Associate paying Half-a-Guinea a Year is entitled—

14. To a non-transferable ticket admitting to all the Society's exhibitions and shows at 12.30 o'clock.

15. To be present at meetings, but without voting on any matters relating to the affairs of the Society.

N.B.—Associates must be *bona fide* gardeners or employes in a nursery, market garden, or seed establishment, and must be recommended for election by two Fellows of the Society.

The Society being incorporated by Royal charter the Fellows and Associates incur no personal liability beyond the payment of their annual subscriptions.

The Society's Exhibitions and Shows are held in the drill hall of the London Scottish Volunteers, James' Street, Westminster, about equi-distant from the Victoria and St. James's Park stations of the District Railway, and close to the Society's rooms at 111, Victoria Street, and to the Army and Navy Stores.

Note.—Any lady or gentleman desirous of joining the Society may obtain forms and full particulars on application to the Secretary, the Society's offices, South Kensington, up to the 25th of March, and thereafter at the offices, 111, Victoria Street, S.W.

MARCH 13.—Tuesday last saw the last of the familiar committee meetings in the conservatory at South Kensington, and earnest were the wishes of the members of the committees there assembled—and others, now that the severance with the ill-fated locality is all but accomplished, that, in its future home a greater need of prosperity, and a long term of usefulness, may fall to its lot Exhibits were not numerous, but what there were, was of interest to gardeners of all classes, for there were some few choice species and varieties of *Obolontoglossum* from Mr. Jacomb; a *Utricularia* of much beauty, and some few Orchids from the President's garden, at Burford Lodge; Mr. Tantz showed some of his favourite *Cypripediums*; Mr. Smece astonished everyone with some beautiful panicles of *Cyrtopodium St. Legerianum*; and varied collections were sent by Messrs. Veitch & Sons, Chelsea; Messrs. Veitch & Son, Exeter; and Messrs. Barr & Son, Paul & Son, T. Ware, J. Crook, and others.

A few Grapes and Apples, well kept, were likewise shown.

Scientific Committee.

Dr. M. T. Masters, Vice-President, in the chair. Present—Messrs. Scott, O'Brien, Pascoe, Ridley, Murray, Smith, Dr. Lowe, Professor Church, and the Honorary Secretary, Rev. G. Henslow.

Hybrid Orchids.—Some cut flowers were forwarded by Mr. Veitch with the following observations:—"The two flowers of *Dendrobium nican* (byb.) Rehb., were each raised from a different cross. One from *D. lituiflorum* and the Assam form of *D. Wardianum*, and the other from *D. lituiflorum* and the Burmese form of *D. Wardianum*. The Assam *D. Wardianum*, as is well known among the cultivators of Orchids, has shorter and more slender stems, but more highly coloured flowers than the Burmese form, and it will be noticed that the last-named peculiarity is perpetuated in the hybrid. We may also add, that the seedling from the Assam form has more slender stems than that from the Burmese form, which, like its parent, has the more robust stems and paler coloured flowers."

Hybrid *Phalenopsis*.—Mr. Veitch also sent a supposed hybrid as being a possible cross between *P. grandiflora*, Lindl. (*P. amabilis*, Bl.), and *P. rosea*. The above specimens were entrusted to Mr. Ridley for examination and report.

***Cattleya Triane*, abnormal forms.**—Mr. O'Brien brought flowers of this plant received from the gardens of Mr. W. Furze, Roselands, Teddington. They were curious on account of their arising from different pseudobulbs, but all having the median sepal in a petaloid condition. In one flower all the parts were present; whereas in two others the petals were absent, but apparently partly "incorporated with the median sepal." Peculiarities also existed in the column. Dr. M. T. Masters undertook to examine and report upon them.

***Strophanthus madagascariensis*.**—This is a new species, named and sent by Dr. Daruty, of Mahéburg, Mauritius. The genus is African, of the order Apocynaceae, or "Dogbanes," the name being derived from the cord-like appendages to the corolla. It is remarkable for the structure and poisonous properties of the seed. The latter somewhat resembles that of the Dandelion, but is larger, and has the silky hairs distributed down the greater part of the shaft. The natives crush the seeds, from which a red oily mass is obtained, with which they smear their arrow points. Several varieties or species are known, but more material is required for an accurate discrimina-

tion of them. As a drug, the active principle Strophanthin, is found in all parts of the pod as well as the seed, and is very powerfully toxic, one-fiftieth of a grain killing a large dog. It seems likely to prove to be a valuable remedy for deranged action of the heart. (See Christy's *New Com. and Pl. Drugs*, No. 10, p. 7.)

Manaca, or Mercurio-Vegetal Root.—Mr. T. Christy sent a specimen of the medicinal root of *Franciscea niflora*, the bark of which contains the active principle Francisceine. The root is of a woody nature, tapering, and of a light-brown colour externally, being of a cinnamon-brown within. From Dr. J. Hutchinson's experience it would appear to be a valuable new remedy for rheumatism, especially of a certain type.

Blue Daisy (?) from Tangier.—Dr. Lowe exhibited a drawing of a small plant, of some 2 to 3 inches high, received from Tangier. The question was raised as to its identity with the Blue Daisy found by Messrs. Hooker, Maw, and Ball on the Atlas Mountains. Dr. Masters undertook to investigate the matter and to report.

Scilla "Droppers."—Mr. Henslow mentioned as a result of a microscopical examination of the attachment of the bulbils, found growing on the inside of the tubular leaf-sheath of specimens exhibited by Dr. Lowe at a meeting of the Scientific Committee (see *Gardeners' Chronicle*, October 15, 1887, p. 475), that there was a vascular union between the bulbil and the vertical cords of the sheath, consisting of a plexus of tracheids, which entered the base of the bulbil on the one hand, and communicated by arches to the cords of the sheath on the other. The bulbil, therefore, originated in the depth of the tissue of the sheath, so that the adventitious rootlets sometimes penetrated beneath the inner epidermis, which they ripped up; at other they pierced through the sheath to appear externally (see *Gardeners' Chronicle*, March 3, 1888, p. 276, figs. 45, 46).

Pears, Cause of Unsymmetrical Growth.—Mr. Henslow explained the cause of so many Pears being unsymmetrical about their axis. This was only the case when the stalk was not vertical and the want of symmetry increased its obliquity. He attributed the growth to the effort of the Pear to meet the strain imposed upon the stalk as the fruit increased in weight. The two forces to which it is subjected are gravitation, or the weight acting in a vertical direction, and the tension along the stalk. The resultant of the two forces tended to wrench the fruit from the latter at its point of insertion at the base of the Pear. To meet this strain the fruit thickened in the opposite direction, so that the "hump" is always at the base and on the outer or opposite side of the fruit. The effect often extends over the whole of the outermost half of the Pear, so that a vertical plane at right angles to the one in which the stalk lies cuts the Pear into two very unequal portions. When the stalk hangs vertically, as is more usually the case in Apples and in Oranges, there is little or no obliquity, so that the Pear grows symmetrically round all points of its axis, the radii of the circular transverse sections being all equal.

Floral Committee.

Present:—G. F. Wilson, Esq., in the chair, and Dr. M. T. Masters, Rev. W. Wilks, G. Nicholson, H. Bennett, H. Herbst, W. Bates, W. H. Lowe, G. Paul, J. Walker, R. Dean, W. Wildsmith, Shirley Hibberd, W. Goldring, J. Laing, J. Dominy, H. Ballantine, H. M. Pollett, C. Pilcher, A. F. Lendy, W. Holmes, T. Baines, J. O'Brien, E. Hill, and G. Duffield.

Orchids.—A pretty display of *Odontoglossum* was afforded by numerous small plants from the gardens of F. C. Jacomb, Esq., Amherst Park, Stamford Hill (gr. Mr. May). Most of these were superior types of their respective species, and were certainly well-grown, thrifty little plants. A very fine *Odontoglossum crispum* was named Mrs. F. Jacomb, the flower segments very broad, forming an almost circular flower, and of great substance. There were *O. triumphans superbum*, *O. Wilkeanum superbum*, *O. hystrix*, *O. Pescatorei*, *O. maculatum*, *O. Andersonianum*, and others.

Amongst the collection of plants from Sir Trevor Lawrence's garden were the dwarf-growing *Ceclogyne sparsa*, a strong *Angraecum Sanderianum*, with four long spikes of flower, and many aerial roots; and a cut flower of *Phaius tuberculatus* of the greatest brilliancy and beauty.

From D. M. Pollett, Esq., Fernside, Bickley, came *Odontoglossum blandum* with seven spikes of flower, for which a Cultural Commendation was awarded;

and *O. crispum rubro-maculatum*, on which large patches of chocolate-brown, of singular shape and disposition, on the white sepals and petals. The varieties of *Cypripedium* from F. G. Tautz, Esq., Studley House, Shepherd's Bush (gr. Mr. Cowley), consisted of *Harrisonium vivicans*: the pouch and the points of the petals are red-brown, and dorsal sepal, dark brown with darker vertical lines; *Measureseanum*, in which the pouch is orange-coloured; *Dauthieri marmoratum*, the handsome feature in this flower being the dorsal sepal, which is green, coarsely lined with purplish-brown, and having a white margin.

Mr. H. Perkins, gr. to W. H. Smith, Esq., Greenlands, Henley-on-Thames, exhibited *Dendrobium Cooksoni*, Greenlands variety. The plant was a well-grown example, and received a Cultural Commendation. It is a pity the flowers of this variety do not expand better so as to show the inner colouring to a greater extent.

A. H. Smea, Esq., The Grange, Wallington (gr. Mr. Cummins), exhibited two magnificent spikes of varieties of *Cyrtopodium Saintlegerianum*, one of them being darker than the other. In each the bracts of the flower-stalk have much the same shade of yellow and brown as are found in the flowers themselves, and the darker has the flower tints in a marked degree in the epidermis of the flower-stalk. Individually the flowers are rather insignificant in size, but in the mass as shown they make a grand display. A Cultural Commendation was awarded. The Hackwood variety of *Ceclogyne cristata*, a bold, pure white flower, came from the same garden.

A notable plant of *Dendrobium Wardianum* came from the garden of F. Wigan, Esq., Clare Lane, East Sheen (gr. Mr. East). It was fully 4 feet in height, was wonderfully well flowered, and possessed numerous pseudobulbs. A similar award to the above was made.

Miscellaneous Subjects.—A small plant with two flower-spikes of *Utricularia rhytophylla* came from Sir Trevor Lawrence's garden. The flowers, of a rich shade of blue-purple with a palate of vivid gold midway between the centre and the margin, are of the size of a florin, and are poised at the end of slender petioles. We can imagine how beautiful well-bloomed, large specimens of this plant would be. Mr. J. McHattie, gr., Newbattle Abbey, Dalkeith, exhibited a flower-head of a seedling Himalayan *Rhododendron* very like *R. argenteum*. The flowers are translucent-white, disposed in a globular corymb.

Messrs. J. Veitch & Sons, Chelsea, exhibited the cheerful looking *Rhododendron*, Early Gem, free flowering, and in colour rosy-lilac; Violet, The Bride, a single-flowered white variety with good perfume; *Trillium discolor atratum*, useful either for pots or borders; the leaves are dark green, mottled with a lighter shade; flower buds brown purple. A white-berried *Aucuba*, *Primula obconica*, and several plants of *Azala pontica altaclarensis*, a free, showy, yellow variety.

Messrs. R. Veitch & Son, Exeter, showed *Teophipilea cyanocrocos* *Leichtlinii*, with blue and white flowers, thus differing from *T. cyanocrocos*, which is gentian-blue. See G. C. 1872, p. 219. When this bulb is less rare, it will be as much sought for as *Scillas Præcox*, or *sibirica* for indoors or outdoors effects, but at present it is not so easily cultivated.

Some excellent Tea Roses came from Mr. Crook, gr., Farnborough Grange, Hants—these flowers were fresh, cut just at the right moment. He had likewise the now rarely seen *Fuchsia Dominicana*; an excellent form of *Primula obconica* named *purpurea*, *P. erosa* and *P. verticillata*; *Rhododendrons* *Sesteriana* and *Lady Mary Fitzwilliam*; and *Tremandra verticillata*.

From Messrs. Paul & Son, The Old Nurseries, Cheshunt, came a few *Saxifragas*, *Soldanella alpina*, *Cyclamen Coum zonal*, *C. Arkinsi roseum*, *Draba botica*, *Narcissus minor verus*, and the Rose sport from Lady Mary Fitzwilliam, named *Lady Alice*. The sport may now be said to be fixed after several years trial. It is identical with the parent except in colour, which is of the faintest pink. *Saxifraga Frederici Augusti*, a free-flowering yellow-coloured species, the flowers of which are placed at the end of foot-stalks 2½ inches in length. It is showy for a *Saxifraga*, and would prove of value for indoor work. *Crocus Sieberi*, *Galanthus Rodontei* and *Sharlocki*, and two species of *Leucojum* composed the chief items of an interesting group.

Mr. J. Anning, gr., Digsweil Hall, Welwyn, exhibited a spike of flowers of *Beaumontia grandiflora*, and was awarded a Cultural Commendation.

Collections of *Narcissi* in many varieties, *Crocus*, *Scillas*, *Iris reticulata*, *Anemone fulgens*, and the

like were put up by Messrs. Barr & Son and Mr. Thos Ware.

A Silver Banksian Medal was awarded to Mr. Ware, and Bronze Banksians to Messrs. J. Veitch & Sons, Messrs. Paul & Son, and Messrs. Barr & Son, for their groups.

FIRST-CLASS CERTIFICATES.

To Messrs. Paul & Son, for *Saxifraga Frederici Augusti*.

To Messrs. J. Veitch & Sons, for *Violet The Bride*.

To Sir T. Lawrence, Bart., M.P., for *Utricularia chrytophylla*.

Fruit Committee.

Present:—H. Veitch, Esq., in the chair; and Messrs. J. Lee, H. Weir, G. W. Cummins, C. Howe, J. Woodbridge, A. H. Pearson, Sidney Ford, G. T. Miles, J. Smith, G. Norman, J. Bennett, J. Willard, J. Wright, R. D. Blackmore, J. Cheal, P. Crawley.

The labours of the committee were of a very light nature. Mr. Divers, gr., Weirton House, Maidstone, showed a small collection of well-kept Apples of the following varieties:—Northern Greening, Barnack Beauty, Margil, Blenheim Orange, Graham Russet, Cheshunt Pippin, Winter Queening, Cornish Gilliflower, &c. A few Pears were likewise shown by him, but were apparently past their best.

Mr. Crook, gr. to Mrs. Sherwin, Farnborough Grange, exhibited *Lady Downes' Grapes* grafted on Canon Hall Muscat, and also on its own roots; the ungrafted was the bigger bunch, but the other had kept in condition much the better of the two. The bloom on the berries was good in each instance. A small collection of Apples was sent from the same garden. Royal Russet, Cox's Orange, Dutch Mignon, and Bess Pool, were well preserved specimens.

LINNEAN.

MARCH 1.—The President (Mr. Carruthers, F.R.S.) in the chair. The following were elected Fellows of the Society:—Messrs. J. F. Baker, J. B. Farmer, H. P. Greenwood, J. P. Maiden, A. G. Renshaw, A. E. Shipley, and A. Voelcker. An interesting collection of Ferns from the Yosemite Valley was exhibited by Mr. W. Ransom, who also showed some admirable photographs of rare plants, many of them of the natural size. Mr. J. E. Harting exhibited a coloured drawing, life-size, of a South American game bird (*Rufous Tinamu*), which has been successfully introduced into this country at Brightlingsea, Essex, by Mr. J. Bateman, and made some remarks on its affinities, peculiarities of structure, and habits. In a discussion which followed, Mr. W. H. Hudson gave some account of the bird from personal observation of its habits in the Argentine Republic. The first paper of the evening was then read by Mr. E. G. Baker, on a new genus, *Cytinaea*, from Madagascar. This curious plant, to which the author has given the name of *Botryocytinus*, grows parasitically on the trunks of a tree of the natural order Hamamelidæ. Its nearest ally is *Cytinus*, of which the best known species grows on the roots of the *Cistuses* of the Mediterranean basin. The Madagascar plant is without any stem, and the sessile flowers grow in clusters, surrounded by an involucre. Each cluster is unisexual, and the ovary is unicellular, with about a dozen parietal placenta, and innumerable minute ovules. It was discovered during a recent exploration of the Sakalava country, by the Rev. R. Baron, of the London Missionary Society.

The next paper, by Mr. J. F. Cheeseman, was entitled "Notes on the Fauna and Flora of the Kermadec Islands," and, as regards the flora, might be considered as supplementary to a paper on the flora of these islands published by Sir Joseph Hooker more than twenty years ago (*Journ. Linn. Soc.*, 1856). These islands, situated about 450 miles N.E. of New Zealand, between that country and Fiji, were shown to be of volcanic origin, with a fauna and flora resembling to a great extent those of New Zealand. A few land birds were noted as common to New Zealand, and to the list of plants drawn up by Sir Joseph Hooker from collections made by Macgillivray; several new species were added by Mr. Cheeseman, chiefly Ferns. A discussion followed, and in illustration of Mr. Cheeseman's remarks, Mr. J. G. Baker exhibited specimens of a new endemic *Davallia*, closely allied to the well-known *D. canariensis* of the Canary Islands and Madeira. The meeting then adjourned to March 15.

THE WEATHER.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather for the week ending, March 12, is furnished from the Meteorological Office:—

"The weather has been in a very unsettled, rainy, and changeable condition in all parts of our islands. At the end of the period it had become cold again, and snow or sleet was falling at all our more northern stations.

"The temperature has about equalled the mean for the season in 'Scotland, N.' but in all other districts an excess of from 1° to 3° is shown. The highest of the maxima, which were recorded on somewhat irregular dates, ranged from 53° to 56° in Scotland, from 57° to 59° in Ireland, and from 56° to 61° over England. The lowest of the minima were registered either on the 6th or 12th, when the thermometer fell to between 24° and 29° in the 'Wheat

producing' districts, and 28° and 30° in the 'grazing' districts; in the 'Channel Islands' the lowest reading was 37°.

"The rainfall has been more than the mean in all districts, the excess in nearly every case being considerable. The amount of rain which has fallen during the week over the country generally has been greater than any recorded since the week ending November 7, 1887.

"Bright sunshine has been less prevalent than it was last week in all districts, the percentage of the possible amount of duration ranging from 7 in 'Ireland, N.' and 8 in 'England, N.W.' to 25 in 'England, S.W.' and 34 in the 'Channel Islands.'"

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MARCH 24. (AVERAGE OF FORTY-FOUR YEARS).

SCOTLAND.

EDINBURGH BOTANICAL SOCIETY.

MARCH 8.—The Society met this evening in 5, St. Andrew Square, Dr. Craig, President, in the chair. The following communications were read:—

1. "Report on the Excursion of the Scottish Alpine Botanical Club to Norway during the Summer of 1887." By Dr. W. Craig, F.R.S.E., F.R.C.S.E.

2. "Observations on the Fungi and Galls gathered in Norway." By Professor J. Traill, F.L.S. Communicated by Dr. Craig.

3. "A Review of our Present Knowledge regarding the Colouring Matter of Plants." Part I. By P. Sewell.

4. "New Marine Algæ, with Exhibition of Dried and Microscopic Specimens." By George W. Traill.

5. "On Temperature and Vegetation at the Royal Botanic Garden." By R. Lindsay, Curator.

[Want of space forbids our publishing the reports of the Curators this week.]

NOTICES TO CORRESPONDENTS.

AMARYLLIS (SPREKELIA) FORMOSISSIMA: A. C. The same treatment will be required as is afforded the ordinary Amaryllis, that is, potting in February, or top-dressing if the roots are not too abundant in the pots. Over-potting must be avoided, and when the bulbs are small two to five may be put into a 32 pot. On starting the bulbs, a mild steady bottom-heat should be afforded; that of an ordinary hotbed frame, if it is made chiefly of leaves, is very good. The pots should be sunk to a safe depth and to the rim, if there be no danger of burning the roots. Water must be given with great care until growth is advanced. Ventilation should be carefully attended to, and if a frame be used, a little air should be left on at the back during the night; a thin shading is beneficial during bright sun, but the less of it the better. Soil should consist of rich sandy loam—a little dried cow-dung is the safest enricher. When the summer is well advanced the plants may be brought into the intermediate-house. The first blooms appear in March.

BOLUS: J. M. P. *Hæmaanthus Kalbreyeri* grows well in a cool stove, and *Eurycles australis* in a greenhouse. Both require a good amount of water when growing, and very little when the growth is mature and the flower over.

CINERARIAS: A Subscriber. There is no known method of keeping these flowers fresh in a cut state for longer than two to three days.

DRIVING FLOWERS, &c.: *Snowdrop*. Insert your specimens between two or more thicknesses of blotting paper, and apply a moderate weight. Change the paper in a day or two, and keep on doing this till the specimens are sufficiently dried. Some plants

soon dry, one change of paper being sufficient; others are difficult to deal with. In our issue for January 21 of this year, p. 82, there was given a method of preserving the colours of flowers.

FUNGUS ON FREESIA: H. H. D'Ombraïn. The leaf was affected with *Heterosporium gracile*, Wallr. Allied species are destructive to Pinks and Carnations, and one to species of *Ornithogalum*.

GARDENIA ROOTS: A. Black. Your plants are suffering from the attacks of nematoid worms, fully described and illustrated in our issue for April 9, 1887, p. 488. You must burn your plants and soil, and start afresh.

HABROTHAMNUS: G. P. This genus belongs to the natural order Solanaceæ.

LEAF DISFIGURED: F. S. M. Probably the work of some insect. See next week.

MELONS: Ignorant Gardener. We have no record of the earliest appearance of Melons in Covent Garden, but they are usually to be found there in the middle of May, and that is about as early as really sweet, good-flavoured fruits can be obtained, although with hard forcing, and strong plants on planting out, they can be produced fourteen days earlier.

NAMES OF FRUIT: J. Bryan and T. W. E. Your fruits are out of character. Why not send when the fruits are in good condition?

NAMES OF PLANTS: *Lymington*. *Melanthus major*.—*Viola*. Comte de Brazza, introduced within the last ten years.—*G. H. Vanda suavis* (Veitch's variety); *Dendrobium nobile* (sometimes called *cœrulescens*); *Aspidium coriaceum*.—*A. B.* Send entire fertile frond: *Veltheimia viridifolia*.—*Foreman*. *Pilumna fragrans*.—*Patley*. 1, *Lælia superbiens*; 2, *Vanda tricolor*; 3, *Phaius grandifolius*; 4, *Cypripedium venustum*; 5, *Cymbidium pendulum*.—*G. W. Rogers*. *Odontoglossum crispum*.—*E. H.* Conifers next week.—*A. C.* *Amaryllis*—or, as it is now called, *Sprekelia formosissima* (see above).—*M. H. V.* The flower is not a *Miltonia*, but a *Brassia*, which we will name next week. The variation in the *Cologyne* blooms is remarkable, the extreme forms being very fine.

ROYAL HORTICULTURAL SOCIETY: *Wellwisher*. All information will be afforded you on application to the secretary R. H. S. offices, South Kensington, until the 25th of March. After that date, at 111, Victoria Street, Westminster.

TADERNEMONTANA CONONARIA: G. Humphrey. The flowers were very fine indeed, and the foliage larger and healthier than it is usually to be met with. Where there are roomy stoves this plant should never fail, where early white sweet scented flowers are in request.

WORK ON FERTILISING ORCHIDS: *Th. Lange*. The *Manual of Orchidaceous Plants*, by H. J. Veitch, Royal Exotic Nursery, Chelsea, London, S.W.; Darwin's *Fertilisation of Orchids*, published by John Murray, Albemarle Street, London.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

MARKETS.

COVENT GARDEN, March 15.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. ED.]

MARKET dull. Good sound Apples in demand. James Webber, Wholesale Apple Market.

WHEELER'S DOUBLE GLOSTER
WHEELER'S DOUBLE GLOSTER
WHEELER'S DOUBLE GLOSTER
WHEELER'S DOUBLE GLOSTER
 3s. 6d. pk., 12s. bush., 21s. cwt.

HEAVY cropper, finest quality, and entirely disease-resisting. This Potato will prove most profitable for field or garden culture; the sets may be cut almost to single eyes, so that a bushel will go farther than two or three bushels of some sorts.

YOUR new Potato, Double Gloucester, proved the best Potato we have ever grown, perfectly free from disease, a heavy cropper, and of first-class quality when cooked. From 14 lb. of seed we lifted in August upwards of 300 lb. of fine Potatoes.—W. CLARK.

THE Double Gloucester had from you last spring turned out to be by far the best Potato that ever I grew.—T. WILLIAMS.

YOUR Double Gloucester Potatoes have given the greatest satisfaction by the very large crop; I have had some cooked for table, and can truly say I never eat a better Potato.—HENRY BROWNE, J.P.

A LIST of WHEELER'S CHOICE SEED POTATOS, specially selected, and free from disease, may be had gratis and post-free on application.

WHEELER & SON,
Seed Growers,
GLOUCESTER.

FOR SALE, Early SEED POTATOS of the best kinds:—Breeze's Prolific, Gordon's Pride, Reading Russet, Fortyfold, Magnum Bonum, Imperators. For price, &c., apply to J. SMITH AND SON, Sipton, near Slough.

ORCHIDS.

An Immense Stock of recently imported plants compels a sale of the established plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained and great bargains. See public Journals for high prices recently obtained. The Special Offer affords a paying investment to anyone with glass at command, which should not be overlooked; such plants may never again be offered to the public and the trade.

Lilium auratum.—Eighth arrival of 10,000 Bulbs, the best that money can buy anywhere, 4s., 8s., and 10s. per dozen. Specially imported Non Plus Ultra bulbs, 2s. 6d. each; very liberal allowance to the Trade.

Lilium album Kratzeri.—The most lovely white Lily grown; throws seven to ten flowers, which sell in market at 2s. per dozen; beautiful and rare, 1s. each, 10s. per dozen.

Lilium apiculatum rubrum cruentum.—The dark form of this lovely Lily, most exquisitely marked, 1s. each, 10s. per dozen.

Lilium auratum, platyphyllum, rubro-vittatum, crimson, striped with gold; virginale, pure white, and spotted, with gold band. All these lovely new and distinct forms of auratum, suitable for show purposes, very fine bulbs, 5s. each.

Lilium Harrisii, 10s. per dozen; and all other Lilies equally cheap. Banksian Silver Medal awarded August, 1887.

Japanese Novelties—80 varieties Iris, Tree Paonies, Maples, Camellias, Azaleas. Please apply for special offer to

PERFECT LAWNS
IN
8 TO 12 WEEKS.

"Carters' Invicta Lawn Seed deserves all that is said of it. At the end of March I levelled my kitchen garden and sowed it; by the first week in June it was like a carpet, and was played upon. For fineness and uniformity it is now the admiration of all who see it."—Rev. C. NAYLOR, Crypt Grammar School.

The above preparations are manufactured at our Bonded Stores, and may be obtained through Seedsmen and Florists generally.
Corry, Soper, Fowler & Co., Lim., London.

and for all Glass Structures that require shading material. Sold in packets 1s. each, with full directions for use, and may be obtained from all Seedsmen and Nurserymen.
 Sole Manufacturers and Proprietors,
CORRY, SOPER, FOWLER & CO., Lim., LONDON,

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used **STANDEN'S MANURE** for some years, and have never found any fertiliser so safe and valuable. Its action is literally "magical." We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—**C. M. HOVEY, Boston, U.S.A., May 27, 1887.**"

Sold in **TINS,** 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in **KEGS,** at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

CORRY, SOPER, FOWLER & CO. (LIMITED), FINSBURY STREET, LONDON, E.C.

To Grow fine Vegetables and Flowers, Gardeners should use **SULPHATE OF AMMONIA.** One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to **THE MANAGER, Sheffield Gas Company, Sheffield.**

Write for Dr. Voeleker's Report, Pamphlet, Testimonials, and Instructions how to apply

JENSEN'S

Every grain fertilizes because the Guano is perfectly pure. It is most economical, one part of Manure to 100 parts of soil being ample for garden use.

FISH-POTASH

FISH-POTASH contains Ammonia, Phosphates and Potash in large proportions, which are the principal elements of fertilization.

GUANO.

"PURE and ELOQUENT BLOOD."

"... her pure and eloquent blood Spoke in her cheeks, and so distinctly wrought. That one might almost say her body thought."

DR. ROBERTS'S ALTERATIVE PILLS

Have for more than ONE HUNDRED years PURIFIED the BLOOD of all who have taken them, and RESTORED SUCH TO HEALTH. Indeed, in all kinds of SKIN AFFECTIONS (which arise from impurity of the blood) they are invaluable.

IN HIS WELL-KNOWN cure of SKIN DISEASES Dr. Roberts always prescribed a two-fold treatment—his ALTERATIVE PILLS (every box bears the engraving in margin on label), to change the state of the blood, and render it pure; and his POOR MAN'S FRIEND (registered title), as an OINTMENT to relieve itching and to HEAL THE SURFACE.

Ask your Chemist for Dr. ROBERTS'S ALTERATIVE PILLS, 1s. 1½d., 2s. 9d., 4s. 6d., 11s. and 22s. per box; and for Dr. Roberts's POOR MAN'S FRIEND (Ointment of many virtues), 1s. 1½d., 2s. 9d., 11s. and 22s. per pot, and see our name.

BEACH & BARNICOTT (Successors to Dr. Roberts's), BRIDPORT, on each, as without it none are genuine.

IN THE EVENT of ANY DIFFICULTY in OBTAINING THEM, either, or both, will be sent, post-free, on receipt of value, by BEACH & BARNICOTT, BRIDPORT, who INVITE UNIVERSAL APPLICATION for their Descriptive Circulars, in regard to other Specialities of the well-known Dr. Roberts for the practical cure of difficult diseases, which will be sent to any address, post-free. Every one affected cannot but read them with profit.

The above sketches represents the newest and most effective form of Circulating Boiler for Heating Horticultural Houses, Churches, &c. This form of Boiler is particularly advantageous for shallow drainage. It has more direct heating surface than any other made heretofore of the same weight and depth. No skill is required in setting. The flue being continuous and undivided avoids all swirls or obstructions to the draft.

For further particulars apply to Messrs. MARRIOTT AND GRAHAM, Plantation Boiler Works, Glasgow; or the Patentee, JAS. ANDERSON, 53, Woodstock Road, Belfast.

CARMAN, to a Nurseryman.—G. WIGLEY, 9, Doncaster House, Ossulton Street, London, N.W.

HOLLOWAY'S OINTMENT and PILLS.—Coughs, Influenza.—The soothing properties of these medicaments render them well worthy of trial in all diseases of the lungs. In common colds and influenza the Pills taken internally and the ointment rubbed externally are exceedingly efficacious. When influenza is epidemic this treatment is easiest, safest, and surest. Holloway's Pills and Ointment purify the blood, remove all obstructions to its free circulation through the lungs, relieve the overworked air tubes, and render respiration free without reducing the strength, irritating the nerves, or depressing the spirits. Such are the ready means of saving suffering when afflicted with colds, coughs, bronchitis, and other complaints by which so many are seriously and permanently afflicted in most countries.

TESTIMONIALS.

From Mr. C. DAVIES, Head Gardener to the Right Hon. Lady Howard de Walden, The Mote Park, Maidstone:—

"GENTLEMEN,—I have Lady Howard de Walden's permission to say the new Houses erected at the Mote Park Gardens give general satisfaction, and I must add the improvement in your new method of laying pipes is as effective as it is simple, and I have no doubt, when better known will be much adopted.

"I remain, gentlemen,
 Yours faithfully,
 "C. DAVIES."

From ALFRED SHUTTLEWORTH, Esq., Harts-holme Hall, Lincoln:—

"DEAR SIR,—I have pleasure in saying that the work, both as regards the new Vineries and Orchard House, has been carried out most successfully. The Boiler also gives satisfaction.

"Yours faithfully,
 "ALFRED SHUTTLEWORTH."

80,000 CLEMATIS, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 24s. per dozen, strong plants; extra strong plants, repotted into 5 1/2-inch pots, 2s. 6d. each. Descriptive LIST on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

TREES and SHRUBS for the SEA COAST. CATALOGUE Free on application. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

A Good Potato, of Sterling Worth. MAIN CROP KIDNEY, W. W. JOHNSON AND SON. First-class Certificate awarded by the Committee of the Royal Horticultural Society, September 21, 1887. It was tested by cooking, and described by the Committee as a "White Kidney, with clean, rough skin, white flesh, a good cropper." This Potato is pronounced by competent judges as likely to become one of the best Main Crop Potatoes of the future. It has entirely resisted disease; tubers have a handsome appearance, with very shallow eyes; are white, mealy, and of the finest flavour when cooked. In excellent condition for the time of taking up until late in the spring. Price per peck of 14 lb. 5s.; per bushel, 18s. Wholesale of Messrs. HURST AND SON, 152, Houndsditch, London, E.; and from W. W. JOHNSON AND SON, Seed Potato Growers and Seed Merchants, Boston, Lincolnshire.

TREES and SHRUBS suitable for Towns and Smoky Districts. CATALOGUE Free on application. RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

RASPBERRY CANES. Selected Fastoff, 30s. per 1000. STRAWBERRY PLANTS, Sir Joseph Paxton, 12s. per 1000. RED CURRANTS, 2-yr. old, 8s. per 100. Terms Cash. R. BATH, Osborne Farm, Wisbeach.

To the Trade. SEED POTATOS. H. AND F. SHARPE will be pleased to make special offers of their carefully selected stocks of SEED POTATOS, raised on their own farms expressly for seed purposes. Seed Growing Establishment, Wisbech.

CHIRYSANTHEMUMS.—New, Descriptive, and Priced CATALOGUE of 1000 New and Old Varieties worth cultivation, giving Raisers' Name, Year of Introduction, List of Early, Medium, Late, Exhibition, Specimen, Market and Scented Varieties, with heights and other information, and Cultural Directions, by E. Molyneux and C. Orchard. Post-free, 6d. ROBT. OWEN, F.N.C.S., Floral Nurseries, Maidenhead.

CABBAGE PLANTS, very strong autumn sown. Enfield Market and Robinson's Drumhead, 3s. 6d. per 1000; 30s. per 10000. LETTUCE, Hardy's Northern King Cos, 5s. per 1000. CURRANTS, Red, Black, strong 3-yr. old, 10s. per 100. Package free, extra plants for carriage. Cash. H. J. HARDY, Stour Valley Nurseries, Bures, Suffolk.

ORCHIDS.

An Immense Stock of recently imported plants compels a sale of the established plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained and great bargains. See public Journals for high prices recently obtained. The Special Offer affords a paying investment to anyone with glass at command, which should not be overlooked; such plants may never again be offered to the public and the trade.

Lilium auratum.—Eighth arrival of 10,000 Bulbs, the best that money can buy anywhere, 4s., 8s., and 10s. per dozen. Specially imported Non Plus Ultra bulbs, 2s. 6d. each; very liberal allowance to the Trade.

Lilium album Kratzeri.—The most lovely white Lily grown; throws seven to ten flowers, which sell in market at 2s. per dozen; beautiful and rare, 1s. each, 10s. per dozen.

Lilium speciosum rubrum cruentum.—The dark form of this lovely Lily, most exquisitely marked, 1s. each, 10s. per dozen.

Lilium auratum, platyphyllum, rubro-vittatum, crimson, striped with gold; **virginale,** pure white, and spotted, with gold band. All these lovely new and distinct forms of auratum, suitable for show purposes, very fine bulbs, 5s. each.

Lilium Harrisii, 10s. per dozen; and all other Lilies equally cheap. Bauksian Silver Medal awarded August, 1887.

WHEELER'S DOUBLE GLOSTER

WHEELER'S DOUBLE GLOSTER

WHEELER'S DOUBLE GLOSTER

WHEELER'S DOUBLE GLOSTER

3s. 6d. pk., 12s. bush., 21s. cwt.

HEAVY cropper, finest quality, and entirely disease-resisting. This Potato will prove most profitable for field or garden culture; the sets may be cut almost to single eyes, so that a bushel will go farther than two or three bushels of some sorts.

YOUR new Potato, Double Gloucester, proved the best Potato we have ever grown, perfectly free from disease, a heavy cropper, and of first-class quality when cooked. From 14 lb. of seed we lifted in August upwards of 300 lb. of fine Potatoes.—W. CLARK.

THE Double Gloucester had from you last spring turned out to be by far the best Potato that ever I grew.—T. WILLIAMS.

YOUR Double Gloucester Potatoes have given the greatest satisfaction by the very large crop; I have had some cooked for table, and can truly say I never eat a better Potato.—HENRY BROWN, J.P.

A LIST of WHEELER'S CHOICE SEED POTATOS, specially selected, and free from disease, may be had gratis and post-free on application.

NOTICE OF REMOVAL.

HORTICULTURAL SUNDRIES.

MISS J. SLAYMAKER, daughter of the late Mrs. Slaymaker, who for 43 years was Tenant of a Shop in the CENTRE AVENUE, COVENT GARDEN, begs to inform her Customers that she has

REMOVED HER BUSINESS OF FLORIST AND HORTICULTURAL SUNDRIES FROM COVENT GARDEN to 25, CATHERINE STREET, W.C.

(directly opposite the main entrance of Drury Lane Theatre), where the Business will be conducted on the same lines and with the same attention to the wishes of Customers and the Public as hitherto.

THE SHOWROOMS at the New Premises will be stocked with all the Latest Designs in BOUQUETS, WREATHS, CROSSES, BASKETS, &c., also all HORTICULTURAL and FLORIST REQUISITES. The favour of an early visit of inspection is respectfully solicited.

The New Premises are situated less than one minute's walk from the Flower Market and Central Avenue, Covent Garden Market, where Messrs. SLAYMAKER & Co. for nearly half a century have enjoyed the support which, with the increased facilities now at their command, they trust still to receive.

CARNATIONS

AND

PICOTEEES.

(PLANT AT ONCE.)

I have pleasure in drawing the attention of the Trade and Retail Buyers to my very extensive stock of Carnations and Picotees, which is probably the largest collection in the Trade. The plants this season are strong and healthy, and intending buyers would do well to procure and plant at once, that they may get well established before the warm weather comes.

The Collection consists of the following sections:—

SHOW VARIETIES.

A very complete collection, including all the finest of the Florists' sorts, especially those which are of good constitution.

BORDER VARIETIES (to name).

These have for many years been a great specialty with me. An enormous quantity of them are sold annually. They are all good free vigorous sorts, and such as produce plenty of flower, and are, in consequence, specially suited for the Trade who want quantities of Carnations for cutting.

SELFS and CLOVES.

A very fine collection, including many varieties of recent introduction. These are specially adapted for border planting; they mostly are all flowering, distinct, and bright-coloured sorts. Many of them are strongly Clove-scented.

YELLOW GROUNDS.

An unique collection, which has been materially extended during the last two seasons, and there are now included amongst them many sorts which are as free, both in growth and flower, as the Border varieties, or the Selfs and Cloves, and are, in consequence, still fitted for outdoor planting, and charmingly suited for the purpose of supplying cut flowers.

CATALOGUES, with full descriptions and prices of the varieties which constitute the various collections, may be had, gratuitously and post-free, upon application to

THOMAS S. WARE,

HALE FARM NURSERIES,

TOTTENHAM, LONDON.

LAPAGERIA ROSEA for SALE.—Large Plant—covering large space, roots confined. Price—Five Guineas. Purchaser must take the responsibility of removing and taking away.
J. CHITTY, Florist, Mark House Road, Walthamstow.

100 **CONIFERS**, in 50 distinct varieties for 50s.

100 **ORNAMENTAL TREES**, in 50 distinct varieties, including many variegated golden and purple Acers, &c. for 50s.

100 **DECIDUOUS SHRUBS**, in 50 distinct varieties for 20s.

100 **EVERGREEN SHRUBS**, in 50 distinct varieties for 30s.

100 **ROSES**, in 50 finest varieties, of H.P. and Tea on the Seeding Brier, from the open field . . . for 35s.

We may state that we have grown Teas on the Seeding Brier in the open field for many years back, proving that they are about as hardy as the H. P., as we have frequently had the latter cut back to the snow line. It is only when the thermometer registers below zero that they require protection.

100 **HERBACEOUS PLANTS**, in 50 fine varieties for 20s.

100 **PRIMULAS**, in 50 distinct varieties for 50s.

Catalogue of Names may be had free on application.

SHARPE'S NEW PEAS

SHARPE'S VICTORY.

First-class Certificate R.H.S., 1886. This magnificent variety surpasses everything we have ever seen. The habit of the plant is vigorous and much branched. Pods produced in pairs, occasionally three together, well filled with large Peas (ten to eleven), of extra fine flavour, and deep green colour when cooked. Height 2 feet.

Price, 3s. 6d. per Packet.

SHARPE'S QUEEN.

A grand Blue Marrow. Height 2 feet. Pods large, deep green, with large, green, deliciously-flavoured Peas. It is so continuous a cropper that a constant supply may be maintained by it alone after the first crop is ready.

Price, 3s. per Pint Packet.
1s. 6d. per Half-pint Packet.

SHARPE'S TRIUMPH.

An improved Stratagem, and the finest Pea for Market Gardeners; is a Blue, Wrinkled Marrow Pea, of exquisite flavour. Pods large and well filled. Height 2 to 3 feet. On one plant no less than sixty-nine pods have been counted, containing from nine to eleven Peas in a pod.

A. C. WILKIN, Esq., Tiptree, Kelvedon (a large Grower of Peas for Market), says:—"Sharpe's Triumph is a model and grand pattern of a Pea, about 2½ feet high, loaded with pods of a very fine size, dark green coloured, and Peas of a rich and delicious quality."

Price, 1s. 6d. per Pint Packet.
1s. per Half-pint Packet.

SHARPE'S PARAGON.

An improved Telephone, and a hardy, early, prolific Blue Marrow.

Price, 2s. 6d. per Quart,
1s. 6d. per Pint.

HARTLAND'S IRISH-GROWN DAFFODILS.

"The perfumed amber cup which, when March comes, gems the dry woods and windy wolds, and speaks the resurrection."

TRUE to the poetic idea of an ITALIAN CLIMATE. In Ireland, at Temple Hill, Cork, thousands are now tossing their heads in sprightly dance." The following to bloom in March:—

50,000 PRINCEPS	30,000 VARIFORMIS
30,000 NOBILIS	10,000 CORBULARIA CITRINUS
20,000 ABD-RIOH	10,000 PALLIDUS PRÆCOX
8,000 MOSOHATUS	100,000 TELAMONIUS PLENUS
8,000 CAPAX	10,000 PSEUDO-SCOTICUS.

A semicircular Border, containing over 5000 Bulbs of the beautiful WHITE DAFFODIL "LEDA," is a sight not to be seen in the United Kingdom. William Baylor Hartland's unique Collection of Rare White Daffodils will all bloom this month.

* Boxes of Cut Specimens, true to name, from 5s. 7s. 6d., to 10s. With each order for a "Box of Blooms" will be presented a copy of his "Little Book" of Daffodils, unique as a work of art, and faithfully illustrated by Gertrude Hartland, the Book by itself being 1s. 6d. each copy.

237 HIGH HOLBORN LONDON

BEGONIAS A SPECIALTY.—Awarded Four Gold Medals. Quality unsurpassed. Named Singles, from 12s. to 42s. per dozen; unnamed Seedlings, 12s., 18s., and 21s. per dozen; Bedding, choicest, 6s. and 9s. per dozen; choicest named Doubles, from 42s. per dozen; unnamed, very choice, 24s. and 30s. per dozen; choicest mixed, 18s. per dozen. Order direct from us, to procure our splendid strain. The best and cheapest combined procurable. CATALOGUES gratis.

JOHN LAING AND SONS, Begonia Growers, Forest Hill, S.E.

DANIELS' ROYAL NORFOLK RUSSET.

SYN.—"The Village Blacksmith."

THE most REMARKABLE POTATO ever raised. The tubers are of medium size, and roughly netted; eyes, few and shallow; flesh, white; fine grained; boils like a ball of flour, and of the finest flavour. It is a great disease resister, and is pre-eminently adapted to moist soils and districts. We have grown it six or seven seasons, and have never known one diseased.

Price, 3s. 6d., 14 lb.; 12s. 6d., 56 lb.; 21s. per cwt
Orders for 1 cwt. and upwards carriage paid.

UNSOLICITED TESTIMONIALS.

IRELAND.—J. JONES, Esq., M.D., Ardee, September 5. —"In 1885 I had from you 1 lb. of Royal Norfolk Russet. I planted the produce in 1886, and again this season. On the 3rd inst. I dug from two stalks forty-one tubers about 14 lb. Such as were cooked were excellent, white, floury, and of good flavour."

ENGLAND.—From Mr. T. R. Baily, Barrington, Cambs. —"Your Royal Norfolk Russet greatly exceeded my expectations, turning out remarkably well."

SOUTH AFRICA.—From Mrs. Francis, Pietermaritzburg. —"The Potatoes gained first prize as a collection. The Royal Norfolk Russet first as a round variety."

A CHANGE OF SEED ALWAYS PAYS.

Before ordering your supply send for Daniels' Illustrated Potato Catalogue, containing valuable hints on the Potato, with descriptions of nearly 200 kinds, and the latest Novelties. Gratis and Post-free to all applicants.

S. SHEPPERSON,
 FLORIST and SEEDSMAN,
 PROSPECT HOUSE, BELPER,
 DERBYSHIRE,

Begs to inform the readers of this Paper that he is prepared to execute orders for the following plants, all of which are of the very finest possible strains that money can buy. They have all been grown on the Derbyshire Hills, and are therefore very hardy, and warranted to succeed and bloom well. All carriage free for cash with order.

DESCRIPTIVE LIST of Florist Flowers, Ad. stamps, or free to customers.

PANSIES.—A great specialty Five Silver Cups and other Prizes awarded during 1887, probably the best collection in England; the cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, twelve for 3s.; twenty-five for 5s. 6d., Carriage free for Postal Order.

FANCY PANSIES.—Unnamed, six for 1s., twelve for 1s. 6d., twenty-five for 2s. 6d., Postal Order. All different and first-class sorts, free.

CHRYSANTHEMUMS.—Great special culture, the best and most distinct varieties only, of large-flowered, incurved, reflexed, early and late bloomers, pompons, Japanese, &c., including many grand new varieties by the best English, Continental, and American raisers. Twelve distinct varieties, named, well rooted plants, for 2s.; twenty-four for 3s. 6d., free.

GRAND NEW CHRYSANTHEMUMS.—The cream only of the new varieties of 1886 and 1887. Six for 2s., twelve for 3s. 6d., named distinct varieties.

HOLLYHOCKS (Double).—Charters' very finest and most select strain. Twelve varieties for 2s. 6d., six for 1s. 6d.; six extra strong for 2s., Postal Order, free.

CANTERBURY BELLS.—Grand new colours and new forms, double and single. Telescope, Candelabrum, and other varieties. Twelve good plants, to bloom well, for 1s.; twelve extra strong for 1s. 6d., Postal Order, free.

PURE SNOW-WHITE AURICULA.—One of the most beautiful hardy spring flowering plants in cultivation. Two for 1s., free.

AURICULAS.—A really grand strain of this deliciously scented old-fashioned favourite flower, including Turner's Alpines, Dean's new laced varieties, Dewsbury's Giant, and other really fine sorts. Good plants, that will bloom well this spring, three for 1s., six for 1s. 9d., twelve for 3s., all free.

POLYANTHUS.—Finest strain grown, fine large trusses and blooms, and splendid colours. Cannot be surpassed. Twelve for 1s., twenty-six for 2s., 100 for 7s., free. All good blooming plants.

POLYANTHUS and PRIMROSE.—Jack-in-the-Green, Hose-in-hose, and other rare and curious forms unnamed. Six distinct sorts for 1s. 6d., twelve for 2s. 6d., free.

THE NEW DOUBLE SCARLET GEUM.—Quite hardy. Free bloomer. Grand for cutting or decoration. Twelve for 1s., twenty-five for 2s., Postal Order, free.

CARNATIONS, PICOTEEES, and CLOVES.—Strong plants, from finest show flowers only, including many new sorts. Will give a mass of bloom. Twelve beautiful varieties for 2s. 6d., six for 1s. 6d., free.

SCABIOSA (Double).—A really fine hardy plant for garden decoration or cut flowers. Many fine colours. 1s. per dozen, free.

PRIMULA CASHMIRIANA.—Splendid hardy mauve-coloured spring flowering plant. Three for 1s., free.

COLLECTION of twelve HARDY BORDER PLANTS, distinct and useful for decoration and cutting purposes, for 2s., free.

WALLFLOWERS.—Double German, Cranford Beauty, Ware's dark red, and Kershaw's bright red. 1s. per dozen, free.

FOXGLOVES.—Gloxinia-downed, Dean's grand new large spotted varieties, very fine, twelve for 1s. 6d., six for 1s., free.

ALSO the FOLLOWING FREE-BLOOMING HARDY PLANTS: should be in every garden; all at 1s. per dozen, free.—Pure white Thrift, fine edging and spring flower; Malva moscata alba and rosea, beautiful pure white and rose, blooms all summer; Sweet Williams, the finest dark and giant Auricula-eyed; Arabis alba, white spring-flowering plant, beautiful variegated foliage.

STRAWBERRY PLANTS.—Selected crowns, transplanted, Black Prince Improved, British Queen, Alpha, Pauline, Sabreur, Viscountess H. de Thury, Duke of Edinburgh, King of the Earlies, and other extra sorts. 3s. per 100, free. Also the Captain (Laxton's), twenty for 1s., free.

SATURDAY, MARCH 24, 1888.

DARWIN'S GARDEN.

THE grounds at Down House, the residence of the late Charles Darwin, have not only been laid out with taste and care, but planted with a rich assortment of rare trees and shrubs, a few notes on which latter we jotted down the other day when on a long-wished-for visit to that remarkable place—remarkable as having for many years been the home of that once much-maligned but greatest of modern naturalists—and which may be opportune, particularly at a time when that great name has again been brought prominently forward by the publication of his life and letters.

Some of the finest and largest of our forest trees, particularly the Oak and Beech, are growing alongside the "sand walk"—a favourite resort of Darwin's, and near the shrubbery, which is a small wood, composed principally of Oak, Elm, Beech, Birch, and Ash, with an undergrowth of Privet.

Opposite to the stile which conducts one from the little park to the walk above-mentioned, and with its buttressed roots extending for a considerable length, is growing an old and gnarled Oak, whose stem at a yard from the ground girths fully 16 feet, the well-branched head having a spread of 39 feet in diameter. Not far from this giant specimen, and growing on the same side of the path, is one of the Beech whose lofty head and noble proportions indicate great age, combined with a most suitable soil and situation for its perfect development. At a yard from the ground the deeply furrowed stem girths 14 feet 7 inches, and the far-reaching branches cover a ground space of no less than 84 feet in diameter. The total height of this fine tree is nearly 80 feet, and, judging from the well-rounded and twiggy head, as likewise sound and glossy trunk, it is in perfect health, and will yet, should no accident befall, attain to much larger dimensions than those here recorded. A twin-stemmed Ash, of great size and natural beauty, ornaments the path nigh where it enters the woodland, while

goodly-sized specimens of many other trees are freely scattered about. The shrubby, with its well-kept green walk, Holly hedge, and Ivy-clad summer seat, is such a place as anyone might well be forgiven did they covet, and must have been such a secluded spot as was well suited to the taste of its illustrious owner.

Two remarkable Scotch Firs, not remarkable for their great size, but for their peculiarly rounded and weeping heads—this latter is particularly noticeable in one of the specimens—stand in the park just outside the lawn. These trees are certainly well matched both in size and shape, although the head of one is more rounded and weeping, though of the same height as the other; indeed, the umbrella-like head of one is as peculiar as it is unusual.

Of that interesting Conifer, *Thuia plicata*, we noticed at least two well-grown and flourishing plants; while the true *Thuia plicata* was represented by a goodly sized fan-branched specimen of some 25 feet in height.

Growing at some distance from the latter is a fine and rapid-growing *Sequoia gigantea*, the stem of which measures 6 feet 10 inches in girth at 3 feet from the ground, while the branches have a spread of fully 20 feet. This and the latter Conifer are growing in too close contiguity for either ever to become perfectly developed. Lambert's Cypress (*Cupressus Lambertiana*) shows off its true character to perfection, and the specimen here recorded is not only the best finished but brightest foliaged specimen that I have seen for some years. It is 38 feet in height, has a branch spread of 5 yards diameter, and a stem which, on measuring, we found to be 37 inches in circumference at 3 feet up.

Prince Albert's Fir (*Abies Albertiana*), judging from a specimen in the grounds here, seems to be well suited for the particular soil of the locality, and being an ornamental tree of no mean degree, is well worthy of more extended culture than it has yet received at the hands of the British arboriculturist. The specimen under notice is of neat upright habit, not dumy and carrot-stemmed as we too often see, rather sparsely branched—this being usually noticeable in fast-growing trees of Prince Albert's Fir—and about 27 feet in height.

Almost opposite to this tree is growing a fairly perfect specimen of the Japan Cedar (*Cryptomeria japonica*), a fine bushy-headed, fan-branched plant of about 40 feet in height, and with a trunk of good shape, and which reveals in a very decided manner the beautiful warm buff-brown of the bark, and which colour is frequently noticeable in healthy free-growing trees of this peculiarly distinct Conifer. Conspicuous not only for its size, but for its wealth of deep bluish-green foliage, is a well-balanced and upright habited specimen of Lawson's Cypress (*Cupressus Lawsoniana*), this associating nicely and affording a perfect contrast to the mass of round-headed trees in its close environment. It is 42 feet in height, well furnished throughout, and of an easy and pleasing outline.

On the lawn are numerous well-arranged tree-groups, one in which a far-spreading evergreen Oak, of some 56 feet in height, is conspicuous, being very effective when viewed from the house, the rich dark green of the Oak just mentioned harmonising so pleasantly with the lighter tints afforded by the numerous other evergreens which constitute the clump. At a respectable distance from this tree group grow three large Yews, these also, from their close proximity forming a group of imposing grandeur, and doing much to lighten up and diversify the mass of hard-woods by which they are backed up. There is, likewise, a goodly specimen of the Mulberry, and one which from the numerous props and girders with which it is held together and saved from destruction, must be highly valued by the members of the family. It is truly a picturesque tree, with large and shapely limbs, and a far-spreading and well-branched head, one side of which has, however, been considerably marred by the wind divesting it of one of the largest branches. Amongst other trees of in-

terest we noted a Walnut, a young and rapid-growing tree, of about 50 feet in height, and from which annually, we were told, a large quantity of superior fruit is obtained. Growing hard by it is a fine example of the Stag's-horn Sumach (*Rhus typhina*), with thick, supple branches, and a well-formed stem, which shoots upwards for about 25 feet. Seldom, indeed, have we noted a more healthy-looking plant of this Sumach than that just recorded.

Of shrubs worthy of note, by far the most remarkable are two plants of the Wig tree, or Venetian Sunach (*Rhus cotinus*), and which, even during the dull January days, were full of interest, and highly conspicuous from the feathery inflorescence with which nearly every shoot was well provided. Although the flowers of this rarely-seen shrub are small, and, may be, inconspicuous, yet the transformation of pedicels and hairs into white feathery awns, not unlike that of the Old Man's Beard (*Clematis vitalba*), imparts a most distinct and peculiar appearance to the inflorescence, and renders the plant one of great interest during the autumn and winter months. The plants in question were growing one on either side of the neatly-kept walk that leads from the house to the garden and conservatory, and from their large size and great branch-spread—for these extended for fully 9 feet—must have been planted for several years, and in a position and soil well suited for their most perfect development. In passing it might just be noticed, that to anyone in search of a distinct and curious plant, this Sumach is worthy of attention.

Darwin's Barbery (*Berberis Darwinii*) is here represented by at least one noble specimen, it being 10 feet in height, and with branches extending for fully 9 feet in diameter. The thick gnarled stems of this plant indicate great age, and a luxuriance of growth that we have rarely seen excelled. Proud must its owner have been of so fine a specimen of his Barbery; indeed, it is not hard to fancy how pretty a sight would be revealed by so magnificent a plant when in full bloom. *Hydrangea hortensis* looked happy and flourishing in this Kentish garden, quite as much so as we have ever noticed even when fanned by the warm and gentle breezes of the Menai Straits. Many other shrubs were noticed, all in the most luxuriant health, while a line of far-spreading Limes afforded just the protection necessary for the numerous specimens of our native Ferns, amongst which we could not help noticing several fine examples of that most distinct and pretty evergreen species—*Polystichum angulare*. *A. D. Webster.*

PROLIFERATION IN UTRICULARIA.

THERE are two small plants of *U. longifolia* at Kew, and one of these last year was placed by way of experiment just over a small water-tank in the propagating-pit, the basket in which the *Utricularia* was planted being 1 inch in the water, which was kept at a temperature of about 75°. Under this treatment the plant grew rapidly, and some of the leaves bent over the side of the basket so that their tips touched the water. In a short time they pushed out root-like growths as well as leaves from the extreme tip, and from these secondary growths were developed. One of these leaves is represented life-size in the accompanying drawing (fig. 54) made by Mr. Weathers, and in which the nature of the proliferation is well shown. The base of the leaf is at the top in the figure, and the apex, which touched the water, is shown with its "family" of leaves, roots, and bladders. The root-like organs bearing bladders are not true roots, but rhizomes, according to Darwin, from whose book the following is taken. He is writing of *U. montana*, which belongs to the same section of the genus as *U. longifolia*, and which is very similar in leaf and habit:—

"The leaves are entire, elongated, about 1½ inch in breadth, and furnished with a distinct footstalk. The plant produces numerous colourless rhizomes, as thin as threads, which bear minute bladders. These rhizomes appear exactly like roots, but occasionally throw up green shoots (? leaves). They penetrate the earth sometimes to the depth of more than 2 inches."

The development of leaves on these root-like

rhizomes, as shown in the figure, is explained by Darwin's note, but the young leaves are just as prolific as the rhizomes, and this seems to point to a close similarity, if not in function, at least in bud-development, between the leaves and rhizomes in this *Utricularia*. It ought to be added that this semi-aquatic treatment did not agree with the health of the plant, which apparently thrives much better when planted in baskets suspended from the roof and watered every day. *W. Watson.* [We commend this very interesting specimen to the notice of morphologists. It may help them to the explanation of the highly peculiar structure of these plants. Ed.]

NEW OR NOTEWORTHY PLANTS.

CYPRIPEDIUM LATHAMIANUM, n. hybr.

This hybrid between *Cypripedium villosum* (male) and *C. Spicerianum* (female) was raised by and has just bloomed with Mr. W. B. Latham, Curator of the Botanic Gardens, Birmingham, who kindly sent me a good peduncle, and whose name it duly bears. It is one of those hybrids which produce flowers with the characters of both parents. You might call the flowers those of *Cypripedium villosum* with the median sepal of *Cypripedium Spicerianum*. The leaves are stated to be exactly like those of the last named species. The peduncle is ochre-coloured, covered with thin short hairs. The bract is green with the usual dark spots at the base, not equal to the ovary, that is light greenish-ochre-coloured, with reddish and white scattered hairs. The flower was a *fac simile* of that of *Cypripedium villosum* in its general shape and in its size. The median sepal, however, is rather that of *C. Spicerianum*, white, with a dark mid-line of purple, green at the base with a few lines, cuneate elliptic apiculate, with replicate sides. Petals light greenish-ochre-coloured outside with a dark mid-line and brown margins undulate near the apex. Inside, the superior part is light ochre-coloured at the base, then dark brown to the top, greenish at the apex and lower sides. Dorsal sepal cuneate oblong, minutely acute, greenish, shorter than the lip, which is like that of *C. villosum*, though it is of a lighter, greenish-ochre colour. Staminode nearly square, as in *C. villosum*, with red hairs at the base, white borders, on the side, retuse and most obscurely apiculate, and with a green knob in front of the apex. *H. G. Rehb. f.*

ONCIDIUM KRAMERIANUM (Rehb. f.) RESPLENDENS, n. var.

Oncidium Kramerianum was dedicated by me to the late Herr Obergärtner Kramer, of Klein Flottbek, near Hamburg, who was the Orchid grower of our late excellent Senator Jenisch, one of those rich amateurs who, like Herr Kamenerrath Frege, at Leipsic, was desirous of possessing a good botanical library, and of consulting it as often as possible. Mr. Kramer has to be ranked as one of the fathers of European Orchid growing, and this fact should be kept in mind. I published a figure as early as 1854 in my *Xenia Orchidacea*, i., t. 33. I must, however, remark, that the peduncle is usually provided with very much stronger and larger knobs than are represented. I have now at hand a splendid variety, with much larger flowers, brighter colours, and the wonderfully wavy anterior lip, but no trace of the usual brown margin, whether that consist of conferruminate spots or of a continuous line of colour. The callus of the lip is distinct by being longer, yellow at the base and at the apex, white in the middle, with purple-mauve partly thicker bars, while the base and top are adorned with purple-brown bars and spots. I have to thank Mr. W. Bull for this unexpected novelty. *H. G. Rehb. f.*

ODONTOGLOSSUM DICRANOPHORUM, Rehb. f.

Mr. W. Bull kindly informs me that this plant is exactly like a well developed well characterised *Odontoglossum Pescatorei* in size, in shape, in markings of the bulb, &c. In fact, in the absence of

FIG. 54.—PROLIFERATION IN UTRICULARIA. (SEE P. 360.)

flowers it would be put down for an undoubted *O. Pescatorei*, *H. G. Rehb. f.*

CATTELEYA LABIATA PERCIVALIANA BELLA.

A most remarkable *Cattleya*, with very hard wavy petals. It is of the brightest purple colour; the sepals, petals, and anterior purple part of the lip are

covered with very numerous scattered dark purple spots. It is a special ornament to one of the finest collections of *Cattleyas*. It was kindly sent me by Mr. W. Bull in February last. *H. G. Rehb. f.*

LILIO-CATTELEYA BELLA X.

I am indebted to the Messrs. Veitch for a mag-

nificent raceme of this splendid hybrid, obtained from another plant from Mr. Seden's original cross; the first having flowered in 1884. *Laelia purpurata* is the mother plant, the pollen having been obtained from *Cattleya labiata* (the original autumn-flowering type).

The flowers are of great size, the segments bright rosy-lilac, the petals a little darker than the sepals, and much broader; in which character it resembles the pollen parent. The lip, on the contrary, recalls *L. purpurata* in its general appearance, though, like the segments, somewhat intermediate. The front of the lip is intense crimson-purple, the veins being a little darker, and the apex a little paler than the rest; behind this is the pale throat, which towards the base is broken up by purple radiating lines. The spathe is large, olive-green above, somewhat suffused with purple-brown below. The pollen masses are unequal, as in the whole series, both of natural and artificial hybrids, between *Cattleya* and *Laelia*—now a rather numerous assemblage—while the true species of these genera have four or eight pollen-masses respectively. It is a great acquisition as a garden plant. *R. A. Rolfe.*

LÆLIA VIRENS, Lindl.

Here is "a first-class rarity," as Prof. Reichenbach remarks—a plant, moreover, not to be found in Messrs. Veitch's *Handbook*. It was described by Dr. Lindley, in 1844, from a single flower; which unique example now forms one of the treasures of the Lindley Herbarium, at Kew. Prof. Reichenbach remarks that as the plant did not reappear he thought it must be an abnormal state of *L. xanthina*, and treated it as such in the sixth volume of *Walper's Annalen*. However, in 1879 it did reappear, as may be found recorded in these columns, n.s., xi., p. 716, a specimen having been sent by Messrs. Haage & Schmidt. And here it is once more, sent by Mr. Henry Beerling, gardener to E. C. Ball, Esq., Down Lodge, Fairlight, Hastings, to Mr. Kent, and by him forwarded to me for determination. Mr. Beerling observes that the pseudobulbs are 2 to 3 inches long, by $\frac{1}{2}$ to 1 inch broad, the full grown leaves about 3 inches long by 1 inch broad, and that he was given to understand it came direct from Brazil. This is doubtless correct, as Lindley gives Brazil as the source of his original plant. The short peduncle is two-flowered, and the spathe about $1\frac{1}{2}$ inch long. The flowers are about the size of those *L. albida*, the segments pale green and the lip white, this organ being somewhat obscurely three-lobed.

The colour is not at all striking, but it is a genuine *Laelia*, with eight equal pollen-masses, and moreover a very distinct species. *R. A. Rolfe.*

MASDEVALLIA CULEX.

I observe at p. 245 that at the meeting of the Scientific Committee of the Royal Horticultural Society, "Mr. O'Brien remarked on a so-called *Masdevallia culex*, but which is really *Pleurothallis Barbarea* (*sic*), bearing minute delicate flowers." Some few days ago Miss F. H. Woolward showed me a most beautiful drawing, made from a plant bearing either this name or *M. culex*, but no doubt representing the same plant. I instantly recognised it as *Pleurothallis macroblepharis*, Rehb. f., a plant closely resembling *P. Barberiana*, Rehb. f., and which might indeed be taken for it if apart, but not if the two are placed side by side. Both are in flower at Kew; indeed, they have been so for a long time past. *P. macroblepharis* has the general appearance of *B. Barberiana*; its lip is very hairy and flat, not glabrous and sac-shaped, its petals narrowly acicular, not gradually narrowing upwards from a broad base, and its leaves longer and more acute than the obovately-elliptical ones of *P. Barberiana*. There are other differences, but these are the most obvious ones. Can it be that both are known under this spurious name in gardens? And if so, where did the name originate? Perhaps Mr. O'Brien will kindly say if it had the glabrous, sac-shaped lip of *P. Barberiana*, which is well represented in the *Botanical Magazine*. *R. A. Rolfe.*

ROSES.

THE MASSING OF ROSES.

No plant comparable to the Rose in merit has suffered so severely from isolated planting. The general practice of planting each variety of Rose in units has reduced its effects in landscape almost to zero. This mode of planting originated in the scarcity of Roses, and with few exceptions it has prevailed till now. The intrinsic worth and inherent scarcity of Roses was the mother of the invention of bald and bare isolated planting. But now that each popular Rose is propagated by the thousand and tens of thousands, and good available stocks of Roses may be reckoned by millions, there is no longer the shadow of an excuse for the perpetuation of our present mode of planting. Roses are cheap as well as plentiful, but they cannot be moulded into landscapes unless they are boldly massed and skilfully grouped.

To ensure the highest artistic effects Roses must not merely be massed, but grouped. The words here are not used synonymously. Any number of Roses, planted anyhow together form a mass; by a group we mean a mass of one sort of Rose, or of Roses, of different varieties, that will go or harmonise well together. Hence, in forming groups, the influence of colour, form, habit, stature, and general character of the plants must all be taken into account. The effect of each group in itself, its relation to other groups, and to other features in the landscape, must also be taken into due account. Each group will thus be made to form an indispensable feature in the landscape, its secondary and hardly less important function being to strengthen and enrich every other portion of the same. In a word, each group should be strong and definite enough to stand alone, as well as to lend a helping strengthening hand to every other group within range of its influence, the correlation of groups thus giving the finishing touches of grace and beauty to the landscape.

In planting, as in painting, it must never be lost sight of that colour upsets the legitimate influence of mere size; otherwise mere mass would be might, and, in a sense, beauty, in landscape and on canvas. But fortunately it is not so; and the colour of the leaves as well as the flowers, the stature and general habit of the plants all materially affect, and greatly modify the influence of groups of Roses on one another and upon surrounding objects.

The latter must by no means be lost sight of in the determining of the place and size of Rose groups. For example, a group of a dozen or a score of Roses might form a suitable or even a massive one for one garden, while a hundred or more ought not to be excessive for another. As a rule the brighter colours used the smaller the groups may be, and *vice versa*. Again, the larger the demesne the larger the group may be, with good taste and propriety.

In massing different varieties into one group, the law of congruity must be adhered to in regard to stature and general character, as well as colour. Novices will find it by far the easiest course to eschew mixtures and form each group of one variety. This has substantial cultural as well as artistic merits, enabling the cultivator to adapt with the greatest nicety his sites and soils, and modes of cultivation, to the wants of each plant in his many separate groups. For example, the hardier climbing or other Roses may be posted in the more bleak places, while the more tender Noisette, Tea, or Bourbon Roses may be planted on sunny banks, sheltered nooks, and warm dells. The food wants of each group of Roses may be easily provided for, while foreign and robber roots may be the easier shut out through the system of grouping Roses in large masses.

To insure the perfection of each individual in the group is the only way to have the group perfect, and this result can only be reached by a careful selection of plants and by planting them in such soils or on such sites as will ensure vigorous growth and preserve them in health. As to culture, the grouping of Roses affords a wide choice, from the highly arti-

ficial system of close pruning and training mostly adopted with show and dot-planted Roses to the virtual freedom of Nature, in which the cultivator seldom interferes unless to remove some dead or useless branchlets or blooms. I will name a few of the best and most readily and cheaply procured, without making any pretence to an exhaustive list of varieties for grouping.

Though most of the hybrid China and Bourbon Roses bloom but once, they form magnificent groups. Hardly any two Roses can match Coupe d'Hebe and Charles Lawson, while Paul Ricaut, Chenedolé, Vivid (Paul's), Louis Oider, Brennus, and the two whites, Madame Plantier and Triomphe de Bayeux, are all that can be desired for effective grouping.

Among Chinas, the common pink, or blush and crimson, Fellenberg, and Mrs. Bosanquet, are good, and the best of the Bourbons are Queen of Bourbons, Queen of Bedders, Baron Gonella, Souvenir de Baron de Rothschild, and Souvenir de la Malmaison.

The Noisettes furnish a matchless white in Aimée Vibert; and others, mostly yellow Roses, in Céline Forestier, Triomphe de Rennes, William Allen Richardson, and Caroline Kuster; while the well-known Fellenberg furnishes a show of crimson in a class specially short of such colour.

Among hybrid Teas Cheshunt Hybrid is a host of itself, although the colour is objected to by some. We have now the so-called red Gloire de Dijon, viz., Reine Marie Henriette, to lighten it up; Pierre Guillot, Madame Etienne Levet, and are vigorous-growing and fine Roses for grouping in this class, which is now being enriched almost daily, Her Majesty and W. P. Bennett being the latest additions, of which it is too early to write with authority or experience.

Among Teas, the Gloire de Dijon is still by far the finest of its colour and its class, and probably the Beauty Glory—that is, the Gloire de Bordeaux—forms about the most useful and showy second for grouping. Among rose-coloured Teas it is difficult to beat Adam and Souvenir d'un Anni. Duchess of Edinburgh gives us a dash of crimson among Teas. The following will also prove good for grouping in most localities:—Alba rosea, Anna Olivier, Bougère, Devonensis, Etoile de Lyon, Homère, Letty Coles, Madame Charles, Madame Lalort, Madame Willermoz, Marie Van Houtte, Marie Sisley, Saffrano, Souvenir de David, Souvenir d'Elise.

Hybrid Perpetual White.—Boule de Neige, Coquette des Blancches, Mabel Morrison, Mlle. Bonnaire, Madame François Pittet, Madame Lacharme, White Baroness.

Bright Crimson and Scarlet.—Alfred Colomb, Beauty of Waltham, Charles Lefebvre, Camille Bernardin, Crimson Bedder, Comtesse d'Oxford, Dupuy Jamain, Duke of Edinburgh, Duke of Connaught, Etienne Levet, Fisher Holmes, John Bright, Marie Baumann, Red Dragon, Sénateur Vaisse, Star of Waltham.

Dark Crimson.—Abel Carrière, Baron de Bonstetten, Baron Adolphe de Rothschild, Duc de Cazes, Duke of Wellington, Felix Genet, Ferdinand de Lesseps, Maréchal Vaillant, Prince Camille de Rohan, Xavier Olibo.

Carmine.—A. K. Williams, Boildieu, Edouard Morren, Hippolyte Jamain, Jules Margottin, Madame Charles Crapélet, Madame Victor Verdier, Marquise de Castellane, Paul Néron, Penelope Mayo, Victor Verdier.

Pink and Rose-coloured.—Abel Grand, Duchesse de Cambacères, La France (by far the best of its class and colour), Madame Montet, Magna Charta, Miss Hassard, Rev. J. B. M. Camm, Royal Standard, William Warden.

Blush and Flesh-coloured.—Baroness Rothschild, the first of its class and colour; it would be almost impossible to have too many masses of this and La France in any garden or landscape; Bessie Johnson, Captain Christy, Comtesse de Serenyi, Madame Rivers, Madame Vidot, Thyra Hammerich, *Rosa*.

NEGLECTED ROSES.

I am very pleased to see the suggestion made for again cultivating some of our almost forgotten Roses. I do hope the hint will be taken by our

large growers. I cannot help thinking that, for the last ten or twelve years, we have given too much attention to the exhibition class; or, to put it another way, we have been watching on our part to keep the garden Roses so noticeable as should have been. Certainly we may admire, and admire again, the beautiful exhibition Roses for their size, exquisite shape, distinct and clear colour, and some for their fragrance; but when we come to the main object, viz., to supply the multitude, I venture to say a great many of the grand exhibition Roses are not suitable to a grower who has but a small and confined garden, and may only require perhaps half a hundred trees. Every grower cannot be an exhibitor, yet they have the same love for the Rose as those who grow their hundreds or thousands. The conclusion I arrive at is we must not let our best garden Roses die out, but in the large gardens may they find their place in the rosery, and also in the borders of our villa residences, to which purpose they are especially adapted by their real hardiness, durability, and free-blooming qualities. Besides, such Roses as have been mentioned in your recent issues, I may name the following:—Pius IX., Paul Ricaut, Géant des Batailles, Madame Rivers, William Griffiths, Bourbon Queen, Mrs. Elliott, Duchess of Norfolk, Fellenberg, and the Boursault. We should probably have fewer complaints as regards so many plants dying, and one might cut and come again. *F. P.*

The list given by your correspondent on p. 302 of the Roses with which he won the 10 guinea cup at the first National show, on July 1, 1858, is a remarkable one as showing what thirty years have effected; but surely your correspondent must be wrong as to one Rose, Charles Lefebvre. It was not in existence then, nor was it let out until three years afterwards—in 1861. *Wild Rose*.

THE HERBACEOUS BORDER.

IRIS CAUCASICA.

Amongst the early flowering Irises capable of being grown outside in this country the above takes a first place. It is a very interesting species, and said by Marshal von Bieberstein to be frequent on sunny hills round Tiflis, flowering early in spring. The golden-yellow flowers are produced from the base of the three upper leaves. The falls are marked with blackish-brown streaks and spots. The leaves are narrow, pointed, bright, shiny green on the upper surface. This appears to be a most useful plant for outdoors; it is perfectly hardy even in exposed positions, the flowers being of such substance as to withstand considerable cold without injury. It is also known under the name of *I. orchidioides*, Xiphion, &c. Now in flower in the alpine-house at Kew. *D.*

"LENTEX ROSES."

From a state of semi-obscure these Lenten Roses have, almost by a single stroke of the camel's-hair pencil, been raised to a position demanding the attention of all lovers of spring gardening. Some twenty years or so ago many of these were to be met with only at rare intervals in the gardens of the curious; but now, so rapid has been the development, that few places of note but can boast of good selection. *I. colchicus*, *I. guttatus*, and perhaps *I. orientalis*, have contributed the largest share to what, for convenience sake, may be termed the florist varieties, many of which are exceedingly beautiful both in form and marking. For ordinary purposes they divide naturally into two groups; first, the *I. orientalis* section, retaining their leaves throughout the winter season, and having large ornamental flowers; and the *viridis* section, having deciduous or non-persistent leaves [?], and small or medium-sized usually green or lurid-purple flowers. To the latter section belong such well-known garden plants as *I. dumetorum*, *I. pallidus*, *I. Bocconi*, *I. purpurascens*, *I. viridis*, &c., and to the *orientalis* section belong all those of real commercial value, including *I. antiquorum*, *abchasicus*, &c., to which we wish to draw attention, as this is the group that has been so wonderfully improved by the hybridists. In 1874, vol. i., n.s., of the *Gardeners' Chronicle*, these

hybrids were noted for the first time by the late Professor Koch, who had given considerable attention to the working out of this genus; and in a later volume a figure was given of one of the first batch of seedlings raised by M. Heinemann, of Erfurt. Since then the improvement has been rapid, as they readily cross themselves; seed gathered from a mixed group is sure to give results. The colours range from pure white in *H. orientalis* to deep wine-purple in *H. colchicus*, with various purple spots, and blotches as in *guttatus*, and the hybrids between that species and *colchicus*. They bloom at a time when flowers in the open air are rare and when planted with a view to shelter from the spring winds surprising results will be obtained, and a certain source of replenishing the flower baskets. Indeed, to their general adoption the only serious drawback is their liability to suffer from the cold east wind when planted in exposed positions; this, however, it is possible to remedy, and abundance of good bloom may be had by a judicious choice of situation. *D. D.*

NOTICES OF BOOKS.

HOW AND WHAT TO GROW IN A KITCHEN GARDEN OF ONE ACRE. By E. D. Darlington and L. M. Moll. (Philadelphia, U.S.A.: W. Atlee, Burpee.)

We are by no means unfamiliar with prize essays in this country, and, as a rule, have not found them to prove very valuable or permanent additions to our literature. The book before us with the above heading is a prize essay, but of American origin, and of trade origin also, for the donors of the prizes which served to evoke this effort are seedsmen of Philadelphia, and, as the book shows, have no want of modesty in getting their respective specialties pretty considerably recommended. The book has two divisions, one being the lengthy essay of a Mr. Darlington, evidently a very good practical gardener as they run across the Atlantic; and the second a shorter essay by a Miss Moll, whose remarks are terse, but not specially lucid. The peculiarity of the book is, that it is written for Transatlantic readers solely, and treats of gardening, such as it is, as practised in America; for that reason the work has no special interest for home readers, except for Canadian Britons and such as may contemplate emigration to the Great West; and as the style of the book leads to the inference that such practical gardening as we have here is rather scarce in America, so also does it seem as if good garden labour—we beg pardon, the book has "labor," so sparing are the Yankees of needless vowels—is also.

In advising the formation of a garden, we learn that a square of 208 feet each way is the best, because it facilitates cultivation with the "plow." Here we find ample evidence that labour-saving implements seem to dominate gardening in America, as home gardeners would laugh at the idea of cultivating a kitchen garden with the "plow" only, and for further economy have no cross footpaths, or indeed any whatever, but 10 feet headlands. It seems absurd to term a piece of ground so cultivated and fashioned a garden. What sort of products come from garden soil worked with a plough, only 8 or 9 inches in depth, may well be imagined. Little is heard of the spade or digging-jerk. Possibly the innate powers of American soil are so great that even the proverbial scratching with a rake produces grander crops than do 3 feet trenching and liberal manurings in this old and effete England. We say possibly, but at the same time we think that, with English cultivation, our best home gardens may well rank as relatively—about the most productive spots of soil in the world. That there are odd notions prevalent in the book, to our way of thinking, is evident, from the instruction to plant with vegetables rows of Grape Vines, Blackberry Vines, Sweet Corn, Water Melons, &c.; even Strawberry plants being treated as annuals, and ruthlessly ploughed up after fruiting

to make room for Cabbages. Generally the book indicates that American gardens are cropped with vegetables pretty much as ours are, but with rather diverse designations, with some few exceptions, such as Peas and Potatos. The essayists, however, do not err on the side of profuse lists when referring to kinds or sorts of vegetables, and thus leave their readers less room for doubt as to which may be the best. The publisher has dotted the book pretty liberally with the usual stock woodcuts of any seed list, and so far from publishing it in its present form it does seem as if it would have more fittingly formed part of or a supplement to the seed list by the firm which has shown so much enterprise in procuring the publication.

It is a little distressing to the novice to find one essayist advising the application of manure in the autumn that it may during the winter become thoroughly incorporated with the soil, and the other strenuously urging that such autumn dressing would lead to waste, through the wasting effect of the winter rains. Possibly a mere novice would try both plans, and find out for himself which was the best, but a guide to practical gardening should not leave such an elementary matter a subject for doubt.

THE FARMER'S FRIENDS AND FOES. By Theodore Wood. (Swan, Sonnenschein, Lowrey & Co.)

The object of this book is most laudable. No doubt a vast deal of mischief is done and much useless expenditure occurred as direct consequences of our ignorance. Most of us cannot or do not distinguish rightly between our friends and our foes—gardeners too often slaughter their friends, and encourage their enemies. This arises in most cases from prejudice begot of sheer ignorance. But after making this admission there is something to be said on the other side—something which the naturalist does not sufficiently take into consideration. It is all very well for Mr. Wood to tell us that "Nature is far more competent to destroy any animal than we are; so long as we refrain from interfering with her regulations, she will preserve her own balance, and will allow none of her creatures to increase and multiply beyond their due limits; and a very important point is this to ourselves—she will perform the required work at only a small charge, whereas we cannot carry it out save at great and even excessive cost."

We do not question the correctness of this as a general statement, subject to modifications according to the conditions and requirements of particular cases. Nature, to use Mr. Wood's phrase—Nature, left to herself, quietly crowds out the weak and unsuitable, who perish at the hands of their stronger and more pliant colleagues; and so long as the conditions remain tolerably uniform, a sort of dead level of mediocrity is attained to, in which no one plant insect, beast, or bird has undue prominence over another. It is a sort of socialism wherein there is no room for superior talent or skill, but where all the workmen are placed about on the same level. From North-west Africa to Scinde is a long stretch, but the conditions are so uniform that the flora is nearly the same throughout the whole distance. Change the conditions only in the slightest degree, and the equilibrium is upset. By way of illustration, let the reader bethink himself of the meadows and downs, the bogs and heaths of his native country. Each has its characteristic population over the whole area. Break up the pasture land, cut down the trees, drain the bog, and a change in the population at once takes place. But—and here is our point—the farmer and the gardener do not want any such socialistic uniformity and even balance as Nature left to herself would induce. The cultivator in a general way wants to grow one particular crop in one particular place, and he does not want intruders of any kind. So far as he can, the cultivator takes care to place his plants under those conditions which he knows to be advantageous, and he exerts himself, or ought to do so, to counteract or evade those influences which he knows to be preju-

dicial. It is not the balance of Nature that he wants, it is the welfare of some particular crop that he endeavours to secure. Looked at from this point of view the farmer and gardener are right enough in principle in harrying what they take to be their enemies—their mistake occurs, as we have said, in not sufficiently recognising what will help and what will injure them. If Mr. Wood's principles were pushed to extremes we should have to allow the locusts to take full possession of Cyprus or the rabbits of Australia. Doubtless Nature would in the end restore the balance somehow—the locusts and rabbits would disappear when there was no more food for them, prior to which time, however, the settlers would have disappeared also and a desert would restore physical equilibrium and the balance of Nature!

In order to see what Mr. Wood would recommend us to do to avoid the damages inflicted by the short-tailed field mouse or vole, whose mischievous propensities have formed the subject of some correspondence in our columns of late, we turned to the chapter on that subject in his book. Alas! the balance of Nature has been so interfered with, as he might argue, that owls and kestrels are quite insufficient to keep these marauders in check, while near towns their aid is altogether wanting. As a set-off, cats are more frequent, and do some of the work that owls and hawks would do if they could. Against all the mischief effected by the field vole, Mr. Wood can "set no compensating benefit whatever, and so must consider the campaign as one of the worst enemies with which the farmer has to deal." Unfortunately Mr. Wood tells of no means whatever by which this avowedly *mauvais sujet* may be kept in check.

Another instance of the one-sidedness of naturalists in dealing with this question is afforded in the account of the starling as given in these pages. Mr. Wood admits that he is a little too fond of ripe Cherries, and if our living depended on the Cherry crop—as that of many Kentish farmers largely does—we should use much stronger language. It is all very well for Mr. Wood to point to the hosts of Daddy-long-leg grubs which the starling devours, but if we were Cherry growers, and not graziers, we should not get much comfort out of that, though, to be fair, it must be added, that in many of the Kentish Cherry orchards grass grows between the trees and starlings might be of use therein when there was no fruit. We are in such thorough sympathy with Mr. Wood in the main, that he will excuse us for twitting him with holding the balance somewhat unevenly in his attack on the farmer. As we have endeavoured to show, there is more than one way of looking at things, and the things themselves have many sides, all of which must be looked at, and a compromise arrived at, from the consideration of many, and, it may be, conflicting points of evidence. In this way the battle of "Common Sense against Prejudice" may be best fought, and we cordially join in the aspiration with which Mr. Wood closes his book, "and let us earnestly hope and trust that Common Sense will win the day." It is only just to the author to say that his book is well calculated to increase and diffuse that exact knowledge without which there is no "common sense."

FRUIT REGISTER.

DIOSPYROS WIESENERI.

In a recent number of the *Revue Horticole* is a coloured figure of a new variety of Kaki, or Persimmon, in which the fruits are of the size of a bantam's egg, oblong, very obtuse at the base, slightly pointed at the apex, and of a rich orange-red colour. The shrub is, when in fruit, very ornamental, while the berries themselves are said to be good cooked or in the form of jelly. Other varieties require to be blotted before they are edible, and we presume this will be the case with this variety also.

PEACH COMICE DE BOURNEMOND.

The last number of the *Bulletin d'Arboriculture* contains a coloured figure of this Peach, which is

recommended by M. Barvenich as one of the most productive, vigorous, and hardy varieties. The glands are small, globular, sometimes reniform; fruit very large, unequal, deeply furrowed, downy, rose-coloured on the sunny side. Flesh white, juicy, aromatic, with a pale red coloration round the stone, which separates readily from the flesh. Season, middle of September.

PLUM PROFESSOR WITTMACK.

This is a Plum belonging to that section of Plums known as Quetsche or Swetsche—excellent fruits for either the kitchen or dessert, and much employed in the fabrication of prunes, and also spirits (*pfauengeist* of the Germans). It ripens at the same time as the larger Green Gages and Kirke's. It is a free-stone of good substance and great sweetness, and is well adapted for the dessert, for drying, and as a preserve. The dried fruits are so sweet in themselves that when made into compotes no sugar need be used.

The parentage is not known, but is supposed to be the Yellow Mirabelle, from which the seed was taken, and the Italian Swetsche on the other side. From the same sowing of Mirabelle seeds the raiser, Herr Uhlhorn, of the firm of Uhlhorn & Co., millers, at Grevenbroich, Lower Rhenish Prussia, mentions the following fact:—"Out of twenty-five seedlings there have been up to the present time only a single Mirabelle, but several Egg Plums and Swetsche, various Damsons, one Apricot Plum, and several Sloe-like fruits. Most probably the fertilisation by bees will account for this variety of form. *Gartenflora, March.*"

HOLOTHRIX LINDLEYANA.

WHEN this plant was exhibited as *Tryphia secunda* in the shape of a single specimen from the Royal Gardens, Kew, lately, it is hardly to be wondered at that it made little impression on the eyes of beholders accustomed to gorgeous Cattleyas and quaint *Cypripedia*. "Horticulturally," said a correspondent, "it is worth knowing only that one may avoid it." We do not think any horticulturist with an eye for something more than the shop-counter of a florist would pass over such a group as that now figured (fig. 55) from a photograph for which we are indebted to Mr. J. O'Brien, who states that the clump had not been arranged, but that it is in the condition in which it was secured.

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM MORGANÆ X.

A GRAND hybrid, figured in the *Gardeners' Chronicle*, Aug. 21, 1886, p. 241, and raised between *C. superbiens* and *C. Stonei*. We find this variety requires the same treatment as *C. superbiens*, thriving best in the East India house; it enjoys a liberal supply of moisture to its roots during active growth, and, indeed, during the whole year, in order to keep the foliage plump and vigorous; in the summer time a slight syringing daily will be found highly beneficial, but avoid heavy syringing, as the water is liable to lie in the axils of the leaves and injure the young growths. These plants do not form pseudobulbs, and consequently they have nothing to support them during the resting season; if they are subjected to drought at that time, therefore, a moderate amount of moisture is necessary in winter to maintain them in a healthy condition. *Cypripediums* should be grown near the glass in order to obtain all the light possible, so that their growths may become well matured, without which they cannot bloom freely; the ripening of the growths produces stronger spikes, and intensifies the colour in the flowers. The material we use in the cultivation of this plant is a mixture of rough fibrous peat, sphagnum moss, and potsherds, the pots being well drained, which keeps everything clean and sweet about the roots. The best time for repotting is just after the flowering season, at which time it commences to make new growths. A thin shade should be used to screen this plant from the

sun, but it should never be shaded unless the sun is shining. *Cypripediums* are subject to the attacks of red and black thrips, but we find these pests are readily destroyed by steaming with the thanatophore, the use of which is becoming very general on account of its cleanliness and the safety with which the remedy may be applied. *B. S. Williams* in "*Orchid Album*," January.

HOULLETIA ODORATISSIMA ANTIQVIENSIS.

This *Houlletia* is free growing, and we find it thrive well in baskets suspended from the roof, where it is well exposed to the light, although it requires to be shaded from the hottest sun in summer. The growing season commences when the flowers are over, and during the formation of new growth a bountiful supply of water is necessary. After the pseudobulbs are mature the plant should be subjected to a period of rest; but during this resting time a little water should be given occasionally in just sufficient quantity to keep the bulbs plump. The bulbs must never be allowed to shrivel, or the plant will rapidly deteriorate, and dwindle away. The material we use for this plant is good rough fibrous peat, from which all the fine particles have been shaken, to this we add some living sphagnum moss and a few broken potsherds or nodules of charcoal. This material will keep open and free, so that no stagnant moisture remains about the roots; drain well, and do not overload the roots with potting material. Moderate-sized baskets are preferable to large ones, but if desirable this plant may be grown

FIG. 55.—HOLOTHRIX LINDLEYANA: FLOWER REAL SIZE; LIP MAGNIFIED.

in a pot, taking care that the bases of the pseudobulbs are well elevated above the rim, in order to allow of a greater amount of surface-room for the roots, and also to allow the water to pass away rapidly from the young growths. We find it grow well in the *Odontoglossum*-house, or in the coolest end of the *Cattleya*-house. *B. S. Williams* in "*Orchid Album*," January.

STENORHYNCHUS SPECIOSUS.

This Orchid succeeds well under the same conditions as the *Cymbidium*, and is deserving of being extensively grown for its erect spikes of flowers and bracts of scarlet colour. The latter are as long as the flowers themselves, and render it a very distinct and showy plant. It is an evergreen, and produces a dense rosulate crown of elliptic-oblong, rather prominently veined, glaucous leaves, from the centre of which rises the flower-spikes. It lasts some long time in perfection, and harmonises well with other things which are in flower at this time of the year. The above is the usual name under which the plant is known, but it is now included in the genus *Spiranthes*. *F. Ross.*

ONCIDIUM LAMELLIGERUM.

This *Oncidium* grows upon the branches of the forest trees in its native country, affecting situations which are cool and moist; we therefore place it in the *Odontoglossum*-house, in company with *O. macranthum* and other plants that grow naturally in the same region, in which situation we find it thrive

admirably; for although we cannot imitate or produce such an amount of moisture as that which envelopes them at night in their native country, we endeavour to represent the natural surroundings as nearly as the means at our disposal will allow; thus they are kept cool and moist, and as much air is admitted, both by day and night, as the condition of the outside temperature will permit. This plant requires very little fire-heat; indeed, the cultural instructions which we have so frequently given in connection with *Odontoglossum Alexandræ* and its varieties will suit it exactly. *Oncidium*s of this section, when once established, dislike having their roots disturbed, and these being thick and fleshy, are very liable to injury unless great care is exercised in removing old soil and renewing it. Like the *Odontoglossums*, this plant requires shading during the summer; indeed, this is the chief secret in maintaining the leaves in their rich deep green colour. *B. S. Williams* in "*Orchid Album*," January.

CALANTHE STRIATA.

This Japanese Orchid belongs to the evergreen section of *Calanthe*, which has such a useful and well-known representative in our gardens as *C. veratrifolia*. Like that species it flowers from the centre of the current year's growth, but does so at a much earlier period; in fact, the new growth and the flower-spike appear almost simultaneously. The flower-spike is erect, 15 to 18 inches high, and bears on the upper half over a dozen flowers, each $\frac{1}{2}$ inch in diameter. The sepals and petals are of a purplish-brown colour, changing to dull yellow at the edges; the three-lobed lip is pale yellow, the crest being of a deeper shade. Contrasted with the dark green plaited leaves the inflorescence has a very pretty and distinct effect. *C. striata* thrives well at the cool end of the *Cattleya*-house, or even with the *Odontoglossums*, and should be potted in a mixture of fibry loam, leaf-mould, and a little sand. From the absence of any mention in popular gardening works it would seem to be somewhat uncommon at the present time, but judging by a plant at Kew now bearing two strong spikes, it is quite deserving of a permanent place in our collections. *W. B.*

LÆLIA CINNABARINA.

This *Lælia* requires to be grown in the *Cattleya*-house, and in a position that will afford it all the light possible; very little shade is necessary, except during the hottest part of the day in summer. It thrives equally well in a pot or a basket, but requires a liberal supply of water in the growing season, which commences soon after the flowers have faded. If the plants require shifting, the best time to re-pot or re-surface them is just as the flowers begin to lose their beauty; this operation must be carefully carried out, avoiding the breakage or bruising of roots. The compost should consist of rough fibrous peat and a little sphagnum moss, whilst drainage must be of the best. After growth is mature reduce the water supply, but not to such an extent as to cause the plant to show signs of distress. This *Lælia*, conjointly with the majority of Brazilian plants, is peculiarly subject to a white mealy scale, which, however, may be eradicated by washing whenever it makes its appearance; but if neglected the plants become permanently disfigured, therefore we cannot too strongly urge upon cultivators the necessity of at once destroying any insect enemies the moment they make their appearance. *B. S. Williams* in "*Orchid Album*," January.

DENDROBIUM CRASSINODE.

The above most beautiful *Dendrobe* I observed flowering to perfection when passing through Mrs. Arbutnot's collection, at Bridgend Place, Bexley (gardener, Mr. Mitchell). It had 125 fully developed flowers. I also noticed some very good varieties of *Cattleya Trianae*, and *Odontoglossum crispum*, which were flowering very freely. *J. Carnell.*

PEATS AND LOAM.—Samples of the above have been sent to us by Messrs. W. Wood & Son, of Wood Green, N., which seem to be everything that a plant grower could desire, the peat for Orchids, and the loam—a soft, silky, friable sort—being of rare quality.

PLANT NOTES.

SAXIFRAGA LUTEO-PURPUREA, *Lap.*

This is undoubtedly the proper name for the plant shown by Messrs. Paul & Son, from their Broxbourne nursery, and which received a First-class Certificate at the last meeting of the Floral Committee, under the name of *S. Frederici Augusti*. The name *Frederici Augusti* was founded on a plant found by Baisoletto, when on a voyage to Dalmatia, under the auspices of Fredericus August, King of Saxony in 1841, and which is figured in a pamphlet with the above title published about that date. In Boissier's *Flora Orientalis* it is placed under *S. porophylla* of Bertoloni, as a syn., the original figure in *Bois.*

pubescent. In the *Flora Græca* figure, which is coloured, the leaves are more pointed, the spicate form of the inflorescence is the same, and the flowers deep purple, as in *S. media*. *S. luteo-purpurea*, the plant certificated is a hybrid between *aretioides* and *media*; and although various forms have been the result of this cross, only two are distinguished—the above, which is our plant, with yellow flowers, and *S. ambigua*, DC., a form nearer *media*, with purple flowers. *S. luteo-purpurea* was first described by Lapeyrouse in the *Flor. Pyren.*, 29; also as *S. Lapeyroussii*, Don, in the *Trans. Linn. Soc.*, 13, p. 397; as *S. aretioides* var. *micropetala*, Seringe MSS., in *De C. Prod.*, iv., 21, with a note that this hybrid is only found where *media* and *aretioides* grow; as *aretioides-media*, Godron, *Fl. de France*, 1, p. 657. With us in the open it is perfectly hardy, and by far the most beautiful of the

TWO GOOD RHODODENDRONS.

R. Hookeri.—This is a dwarf, compact species of the Himalayan lot, and one of the most attractive of them. A plant about 3 feet high is now in flower in the temperate-house at Kew. It is freely branched, the branches covered with a yellowish substance, over a polished bark; leaves thick and leathery, ovate, the apex broad and rounded, and they are 4 inches long, by 1½ inch wide; the petiole is thick, recurved, and about 1 inch long. The flowers are in a compact head or corymb, with from ten to fifteen flowers in each head; the corolla is 1½ inch long and wide, bell-shaped, and coloured deep crimson; calyx large, irregular, and campanulate. The number of stamens in a flower is one of the characters by which *Rhododendrons* are classified, and *R. Hookeri* belongs to

FIG. 56.—HOLOTHRIX LINDLEYANA: FLOWERS WHITE. (SEE P. 364.)

Viag. Dalmatia, t. 1, being quoted. It is also synonymous with *S. media*. *Flora Græca*, t. 376—non Gouan; *S. media*; var. *Sibthorpiana*, Griseb.; and *thessalica*, Schott, *Anal.*, 26. In all the above the flowers are distinctly purple, and as such we know *media* of gardens, not yellow, as in the plant under consideration. In Dr. Engler's *Monograph*, p. 256, *S. media*, Gouan, is made the type. *S. calyciflora*, Lapeyrouse, *S. diapiensoides*, Lap., *S. porophylla*, Bert., &c., are considered synonymous; while *S. Frederici Augusti* is placed as a variety under which is ranged *S. thessalica*, Schott, *media* var. *Sibthorpiana*, and *olympica*, *Flora Græca*, differing from the type chiefly by its spicate inflorescence. The latter definition entirely agrees with Baisoletto's figure quoted above, in which the rosettes are medium-sized, lower leaves obtuse, those on the stem somewhat more acute, and the whole plant glandular

early spring alpine Saxifrages. It forms dense tufts of medium-sized rosettes of closely imbricated leaves, which are lanceolate, apiculate, about six lines long and two broad, margins cartilaginous, finely and irregularly serrated about half their length from the base, with a calcareous coating on their upper half, and nine to seventeen pitted; flower-stems about 3 inches high, with a corymbose paniculate inflorescence of four to eight or more flowers over half an inch in diameter; petals broadly wedge-shaped primrose-yellow, with anthers of a deeper shade. The stem leaves, and oval-acute lobed calyx covered with glandular hairs. Dalmatia, Pyrenees, Saint Bent., Fontaine de Bernadouze, &c. May and June. It is perfectly hardy, and flowers profusely on the open rockery. March and April. With a little protection it blooms much earlier. Now in flower in the alpine-house at Kew. *D. Dewar*.

the ten-stamened group, of which *R. arboreum* is the type. *R. Hookeri* is a native of Bootan, where it is abundant along with *Pinus excelsa*.

R. Thomsoni is somewhat similar to *R. Hookeri*, differing in having shorter leaves, looser corymbs, with fewer flowers in each, and corollas of a deeper crimson, whilst the upper part is dotted with black; the flowers, too, are larger than those of *R. Hookeri*, being 2 inches broad and long. In the form of the calyx and number of stamens these are both alike. *R. Thomsoni* is also in flower at Kew. In the warmer parts of this country these two plants are quite hardy, but the flowers must be protected in spring, or they will be spoilt by cold winds.

GREVIA SUTHELLANDI.

This interesting Cape plant is now flowering at Kew. It has long, thick rather succulent branches,

leafless at the present time, and the flowers are borne in dense terminal clusters of about 34 inches in length. The corolla is composed of five spreading incurved petals, not unlike that of the Saxifrages in arrangement, and there is a cup-like disc at the base between the petals and stamens; the latter organs are 1 inch long and curved outwards. Each flower is half an inch across, and is coloured deep scarlet. The leaves are just bursting their buds, and the plant will soon be in full growth. This plant is one of the most gorgeous of the flowering plants found wild in Natal, but under cultivation it rarely flowers, and even when it does flower with us strong plants produce only one or two spikes. The leaves are almost round, with a cordate base and notched margins, and they are remarkable in being either wholly glabrous or wholly tomentose, the two kinds occurring on the same branch, as long since noted by the late Thomas Moore. W.

THE APIARY.

HEALTHY stocks of bees are now hard at work on fine days bringing in pollen, and breeding is now going on. Take care to keep all warm. Do not attempt to lift out frames of brood at present, as dire results will happen if the brood gets chilled. When the bees are flying generally—i.e., most days of the week—it will be safe to give them a little liquid food. Remember that the object of feeding now is to stimulate the queen to lay, not for the purpose of storage; therefore only give them a small quantity each day, just sufficient for present use. If this be done it is astonishing how quickly a weak hive may become strong. We have several times before given recipes for food, so it is not necessary to repeat them here—it is sufficient to say that the syrup need not be so thick for spring feeding as it is for autumn feeding. I was surprised a few days since at the quantity of pollen the strongest stocks were bringing in, as there appeared to be nothing but Snowdrops in the immediate locality. Noticing that the bees seemed very fond of a high damp wall I examined it, and found it was covered with a quantity of mossy stuff—something of the nature of lichen, but of shorter growth. From this the bees were evidently getting something of use to them. It will soon be time to give the bees artificial pollen in the shape of peameal amongst shavings. I do not, however, advise too much of this kind of treatment. It is preferable to put a little in the Crocus flowers as soon as out, as the bees love to revel in flowers. *Walter Chitty, Pewsey.*

CULTURAL MEMORANDA.

TROPEOLUM TRICOLORUM.

This tuberous species of *Tropeolum* does not seem to be so well known to gardeners as it ought to be. It is a charming greenhouse climber, flowering in March, and continuing to April and May. The slender stems grow to a length of 5 or 6 feet, and are laden with pretty three-coloured flowers, scarlet, black, and green. The tubers should be allowed to ripen in the greenhouse at midsummer, and when the leaves have decayed the pots should be placed beneath the shade of larger plants or under the stage in the greenhouse, and no water given. Early in September growth commences if the tubers be at that time planted in the pots in which they are to flower. It is a good method to plant three tubers in an 11-inch pot, and this affords space for a large handsome specimen to grow. The soil ought to be such as *Pelargoniums* will thrive in, and if a little fibrous peat be added it will be so much the better. When the stems first appear they are so slender as to be scarcely discernible, but they should be trained betimes to the wires of the trellis employed, as the growths are easily injured. The shoots increase in thickness as they become longer, and by the time the first flowers open the whole trellis will be hidden

by the lively green leaves and the very numerous flowers. A more natural and picturesque specimen is produced by fixing a tree branch of some suitable kind in the pot instead of a trellis; but in either case the shoots must be guided regularly over the twigs, as they are apt, if left to themselves, to twist round each other, which spoils the effect the plant would otherwise make, and they require to be trained when in full growth at least twice in a week. The shoots very naturally grow most freely towards the top of the trellis; it is, therefore necessary to have some of them tied down nearer the base in order that the whole plant may be well furnished with flowering growths from bottom to top. We grow them with the *Pelargoniums*, their general treatment being the same. The plants should have sufficient water when in bloom, or the flowers will fade rapidly, and a good succession will not be kept up.

Tubers may be produced freely by simply layering the stems into the pots in which the plants are growing; or another pot may be filled with compost, and be placed beside that in which the parent plant is growing; a stem may be taken and twisted round and round just under the surface; tubers will form at the base of each leaf. Seeds may also be obtained, but they take a long time to vegetate; but it is said that they will vegetate speedily if steeped for twenty-four hours or more in water. Place the seed-pots in a hothouse, and young plants will appear in a short time. *J. Douglas.*

WOAD.

WHEN recently in Lincolnshire, I was much interested in the manufacture of woad. I had an opportunity of inspecting a manufactory on a farm at Skirbeck, Boston, and I was informed there were only two persons at Boston who carried on the manufacture of this dye, and one on the borders of Cambridgeshire where it adjoins Lincolnshire. The woad is manufactured from a British biennial, *Isatis tinctoria*, and it is somewhat remarkable that the dye obtained from it was known to the ancient Britons; those in the South painted their persons with it, hence they were termed Britons from the Celtic word *britho*, to paint, and were thus distinguished from the Picts, who dwelt in the North. It would appear that woad is not such an important article of commerce as formerly; indigo, which can be procured at a much cheaper rate, having taken its place. What is now manufactured goes to the woollen districts of Yorkshire, such as Leeds and Bradford, where it is said to be used with indigo to dye blue, woad being found of great service in fixing the colours.

At the time of my visit, women were engaged in gathering the leaves of the *Isatis* in the fields. The plant has a large woody root which finds its way somewhat deeply into the ground, and it sends up several branches; when the leaves are fit to gather (and it is usual to gather two crops in the year), the women take hold of a handful, and by means of a quick wrench tear them off without pulling up the plant; they are then laid in heaps, and carted to the mill. Gathering is done in dry weather.

Arrived at the mill, the leaves are laid in a circle 2 feet or so in width and several inches in depth, upon an asphalted or concreted floor, and then ground to a paste by means of two ponderous wheels, of singularly uncouth appearance, worked by steam-power. Behind each wheel are a pair of boards so fixed that they collect and place in the circle any portions of the leaves thrown aside by the action of the wheels, and there it is in proper position for the next wheel to grind. I was informed that three-quarters of an hour is the time required to grind the leaves to the proper consistency, and then it resembles Spinach chopped up finely. When ready the wheels are stopped, and the workmen take the woad up in shovels and throw it into vat-like receptacles, and the next morning women proceed to make it up into balls by means of their hands, the balls being of the size of a large Cocoa-nut. They are then taken to

covered sheds, open at the sides, with five tiers of shelves resembling those of a bottle-rack; hurdles are placed upon them, and the balls laid out to dry. Here sun and air combine to dry them until they form a firm crust on the outside. In the process of drying the violet tint can be detected.

In course of time another process is gone through. The balls are beaten up small until they are in the form of a coarse powder; it is then moistened with water and kneaded up until it forms a paste, and then allowed to ferment, being moved about at times for a few days, and then it is placed in large barrels, where it remains until it settles down and forms a hard substance, and in this condition it is sent away to the districts where woollen cloths are dyed.

The most important part of the manufacture appears to be when the balls are kneaded up into a paste and allowed to ferment. I imagine the workmen who take this process in hand know by a kind of instinct when the fermenting process has proved adequate to the end sought, and I was informed that during this process close attention and observation is required, as there is danger of the whole being rendered worthless.

On the fine fertile loam of Lincolnshire the *Isatis* does remarkably well, growing strongly and producing luxuriant crops of leaves. It is about July that the seeds are sown (some being saved for the purpose), and when the plants have attained to a certain size they are thinned out and any weeds removed. The first crop is gathered in July following or a little earlier, according to the season; and the second crop at the end of August or early in September. The following year the plants will produce but few leaves, and run to seed. *R. D.* [A good account of the method of culture pursued is given in vol. xv. (1881) of the *Gardeners' Chronicle*, p. 787, and three illustrations of the mill will be found in our number for March 11, 1882. Ed.]

PINE - APPLES SMOOTH CAYENNE AND CHARLOTTE ROTHSCHILD.

[SEE SUPPLEMENTARY SHEET.]

THESE two useful varieties of the Pine-apple are almost too well known to cultivators to need more than a few words from us. The former is one of the best of the Pine-apples for fruiting in the winter months, swelling quickly with much juice, and of excellent flavour. It can be grown to a weight of 10 lb.; the fruit figured weighed 9 lb. 10 oz. These weights, however, may be considered as quite outside ones, it being a good fruit that will turn the scale at 7 lb. In habit this Pine is rather taller than the Queen, and more spreading, and the leaves are broad, dark green in colour, and brittle.

Charlotte Rothschild, which in form resembles the Providence, is a delicious Pine-apple, with flesh melting like that of a Peach, and equally good for winter and summer; the weight to which it may be grown being about the same as that of the Smooth Cayenne. The one figured weighed 9½ lb. It is a variety allied to the Prickly Cayenne, and was, we believe, first seen in this country at the meeting of the Royal Horticultural Society held on September 16, 1862; three specimens having been sent by Mr. Chantrier, gardener to the Duc de Levis Vantadour, of Noisiel, near Paris. One of these weighed 7½ lb., and the others rather less.

We are indebted to Mr. T. Coomber, The Hendre Gardens, Monmouth, for the photograph, and he was likewise the grower of the satisfactory specimens here shown.

FORESTRY.

EFFECTS OF SEA-WATER UPON FOREST TREES, &c. —I have frequently been asked questions as to the effects of sea-water upon forest trees, and specially upon young and tender plants. A case in point occurred a few years ago; a consignment of plants being sent from a Scotch nursery to Ireland, and in the transit (the sea being rough) the plants got soaked with the salt water. The person to whom the plants were sent hesitated to plant them, and

inquiry was made by the nursery firm as to whether the trees were seriously, if at all, injured by the water. In order, therefore, to prove satisfactorily how far salt water is really injurious to the different species of common forest trees, I made the following experiments:—In the month of April, 1882, I had a bundle of fifty plants of each of the following species tied up in the manner usually adopted by nurserymen in lifting, viz., fifty plants each of 2-year seedling Scotch Fir, 2-year seedling Silver Fir, 2-year seedling Larch, 2-year seedling Norway Spruce, 3-year seedling Oak, 3-year seedling Birch, all 1-year transplanted. The plants were all grown in the home nursery at Cullen House, and were in good health at the time. They were taken to the sea, and allowed to remain in it twenty-four hours, when they were taken back to the nursery, and slugged into the earth till next day, when they were planted into lines in the usual manner. The results were eagerly watched during the first and second year's growth, which was as follows at the end of the two years:—

Results.

Species.	Healthy.	Sickly.	Killed.	
Scotch Fir	29	16	5	The foliage of the evergreens was yellow, and growth less vigorous than those in their natural state, and nearly all the foliage fell off.
Silver Fir	31	16	
Larch	42	8	Though mostly killed down a few inches yet all of the 42 Larches recovered after careful treatment and pruning.
Norway Spruce	45	5	All more or less injured, foliage fell off, and what remained yellowish in colour.
Oak	48	2	All were more or less sickly and injured, but though put far back in growth ultimately recovered.
Birch	14	33	

Those of the Birch that were not killed the first season died down to the surface of the ground the second year, and had to be cut over and a new leader started at the surface of the ground. I also tried the effects of washing in fresh water the same species and the same quantity of each species of plants to lie twenty-four hours in a running stream of fresh water. I planted them also in the nursery line in the same manner and at the same time as the salt-water ones. I had the roots all thoroughly washed, so that not a particle of earth remained adhering to them. The result in this case was that about 10 per cent. died of all the species. By way of forming a proper means of comparison, however, I had a sample of each of the different species planted into the nursery in the usual way without subjecting them to any treatment beyond what nursery plants usually receive in lifting and transplanting, and out of the whole only one plant died, and that was an Oak, C. Y. *Mickie, Cullen House.*

THE FLOWER GARDEN.

RENOVATING LAWNS.—To have lawns in the best possible condition—i.e., with a close, rich, and dense green sward—good treatment is required in periodically top-dressing with manure or soil-ashes, &c. Taking away the grass, and leaving nothing on the sward always causes the growth of moss and a thin grass plant, and which for a lengthened period of the year assumes a rusty appearance, and becomes quite an eyesore in course of time. Lawns which have been allowed to get into this state may be thoroughly renovated by cleaning, seed-sowing, and top-dressing with a rich compost.

Cleaning consists of thoroughly scarifying and clearing away the greater part of the moss, or as much as is practicable in extreme cases; it would be next to impossible to get the whole of it out. With small grass plots and between flower beds the best plan will be found to use a coarse-toothed iron rake, working it each way; but on lawns of large extent this method would be too tedious and laborious, and recourse must be had to other means. The most

efficacious and expeditious plan will be to employ horse labour and a chain harrow; well drag the lawn over with this, crossing and recrossing three or four times each way. Not only will this harrowing loosen a greater portion of the moss from the grass, without injury to the latter, but it will leave the lawn in the best possible condition for seed sowing and top-dressing. After dragging with the harrow nothing further in the way of cleaning will be required, except raking up with wooden rakes and clearing away the loose moss. On this point it only remains to be said that damp dull weather should be taken advantage of for this operation, and should precede seed sowing and top-dressing.

Compost is a matter of importance, and its preparation should take place some time previous to using it, and may consist of rich loam, lime, soot, and wood-ashes, mixed in the proportion of four cart-loads of loam to one of lime, one of wood-ashes, and fifteen bushels of soot; the lime should be unslaked, and, if possible, fresh from the kiln; in ordering the same, it is best to state the purpose for which it is required, so that a suitable quality may be sent, and which should be mostly of a refuse character, i.e., dust and small lumps. In mixing the compost there should be a layer of lime with every alternate layer of loam, and in the event of the first named being in large lumps, as sometimes is the case, sprinkle each layer lightly with water through a rose-pot, which will facilitate slaking. When the heap is made up, allow the same to remain undisturbed for twenty-four hours, then turn it over twice: at the second turning pass it through a screen to free it from rubbish. This should be spread over the lawn sufficiently thick to fill up all small inequalities a fortnight or ten days previous to sowing.

Seed Sowing.—Opinions regarding the right time for spring sowing vary considerably. Some persons advocate its being done at the end of February, some say in March, and others again the first week in April. Having tried each period, I much prefer the last-named. Its advantages are twofold: first, the atmosphere and surface soil is warmer, the seed germinates quicker than if sowed earlier, and thus there is less loss from the depredations of small birds; and liability of young plants to injury from late frosts; and it goes without saying that an unchecked growth is far better than the opposite. The seed should be sown broadcast at the rate of from 12 to 20 lb. per acre according to the state of the lawn, the latter being sufficient for those that are in a very bad state—selecting a calm day for the work, going twice over the ground, and crossing at right angles to ensure even sowing, after which rake in the same, and roll with a light wooden roller. For the succeeding fortnight keep a vigilant look out for small birds, or the consequences will be in some districts the disappearance of a large portion of the seed.

The first cutting ought not to take place before June; immediately afterwards roll and mow with the machine as often as occasion demands. *J. Horsefield, Heytesbury.*

arrives. Attend to disbudding and pinching; a couple of leaves left where a shoot is removed will help on the roots,—thin the blossom-buds where standing too thickly.

Strawberries.—As soon as the fruits on the earliest lot are picked remove the plants to a pit or other place of shelter. If this be done and attention given to watering until such time as the plants get hardened off, they may be planted out about the middle of next month. I have had splendid crops of fruit in September and October off plants thus treated, and the autumn propitious. Attend to the thinning of the fruits on succession plants as they advance, and place little forked sticks to support the fruits, or the stems are liable to get injured; it also keeps the manure-water from the fruit. It may now be necessary, during bright sun and drying winds, to water the plants twice a day, in the morning and again at shutting-up time.

Continue to introduce fresh batches of plants to maintain a constant supply, putting the plants into a cold pit for ten days or so, prior to removing them to the forcing-house.

Melons.—The earliest plants will now have been stopped, and in order to secure an even set it may be necessary to pinch out the first female flowers, next the main stem towards the bottom of the trellis; these will show again about the same time as those at the top. Some growers are in the habit of placing a large body of soil over and around the roots of their plants after they have set their fruit. The system which I have tried and found best, is to secure some good strong loam, and as the roots appear on the surface give the soil a good dusting over with Vine manure, adding afterwards 1½ inch of the loam. This keeps a host of voracious roots on the surface, where they are in direct contact with the warm atmosphere of the pit. A large body of soil rendered sodden by heavy applications of manure-water is a fertile source of canker. Maintain a genial atmosphere by sprinkling and syringing, and secure a good temperature at shutting up time of 90°–95°, and 70° on cold, 75° on mild nights, with a little ventilation after 6 p.m. Make such successional sowings as the conveniences of the garden will allow of being grown.

Cucumbers.—The earliest will now be showing fruit, and may be top-dressed as recommended for Melons, using a compost of one part turfy loam, one leaf-mould, and one old Mushroom-bed manure; pinch early at every joint, and do not over-crop. As soon as the young plants are in full bearing the old winter fruiters should be cleared out. Attend to pinching and training of young plants on hotbeds—one plant to a light will be found to be ample. As soon as the plant has made four leaves, pinch out the point, and four shoots will result. Train one towards each corner, and when these have reached within a foot of the front and back, pinch the points, and the lateral growths at each joint. *Wm. M. Bullie.*

THE HARDY FRUIT GARDEN.

FRUITS UNDER GLASS.

ORCHARD-HOUSE.—Cherries and Plums, which have finished stoning, may have the temperature increased to 55° on cold nights and 60° on mild ones, with abundance of moisture on shutting-up time, when 80° for an hour or two with sun-heat will do no harm, if afterwards the temperature is allowed to gradually decline to 55° or 60°. The orchard-house proper, as a rule, comprises a miscellaneous assortment of Apricots, Cherries, Plums, Peaches, Nectarines, Pears, Figs, and a sort of compromise must be made when the different varieties are in blossom. The Apricots will now be set; then Cherries and Plums will come next, followed by Peaches and Nectarines. The Pear under glass is the most unaccommodating fruit of any, and must not be coddled in any way while in blossom. While any of the trees are blossoming guard against undue excitement by allowing the temperature to rise suddenly. If the morning presages a bright hot day let a little air be put on betimes, gradually increasing the quantity until noon, when it must be reduced by degrees. When the trees are blossoming the pipes may just be made warm, but not hot; dry syringing should not be indulged in, nevertheless a dry parched atmosphere must be equally guarded against, as this weakens the organs of the flowers, and causes the fruit to drop when the critical stage of seed forming

STRAWBERRY PLANTING.—It sometimes happens that planting cannot be done in the autumn, and must be deferred till the spring. The plants set out now will not bear a crop this season, but they may be allowed to bear a few berries; still were the whole of the flowers pinched off as they appear it would be better for the plants. The plants would then be enabled to grow and mature their buds if the cutting off the runners received proper attention also. The ground to be planted should have been prepared by manuring and trenching, and will now be in a suitable condition to plant. After it has become settled and is sufficiently dry to walk upon tread the surface till it is firm, and if some of the sites selected be borders the alleys had better be lined out before the treading is begun. The runners for the spring planting to the requisite number should have been pricked out into lines or beds last autumn, and should be carefully lifted with a trowel, securing a good ball of soil, and planted singly in rows, pressing the soil firmly round the roots. This latter is an important matter and should on no account be overlooked. The distance apart at which these should be planted is 18 inches between the plants, and between the rows 2 feet. After planting it is a good plan to mulch the surface of the ground with short dung; but if space is valuable the space between the rows may be lightly cropped during the present season. *A. Ward, Stoke Edith Gardens, Hereford.*

Nursery Stock and Greenhouse Plants from sample, at Protheroe & Morris' Rooms.

Industrial Horticulture.

THE advertisement of a host of valuable prizes taken during the past year by a well-known gardener, and which was published last week, may well have aroused in the minds of thoughtful readers strange reflections, and possibly led them to wonder whether this sort of thing ought to be the great aim and object of horticultural exhibitions. We hardly know whether on the one hand to congratulate the successful competitor on his wonderful run of luck, or to console with horticulture, that in its development so many of its devotees should seem to exhibit no higher aims than mere pecuniary ones. However, it is money which sets the machine in action, and shows exist only because created by money, and because to many they mean money. Even the Council of the Royal Horticultural Society, although now alive to the other requirements of Horticulture, is endeavouring to get access to the City of London, because it hopes in so doing to tap a store of wealth which there lies either inert, or perhaps unwisely applied. The Council wants to see some of this wealth flowing into its own impoverished coffers, and some of its members individually, with many others outside,

would like to see that wealth more largely diffused amongst the horticultural trade. These are legitimate aspirations, but the Society in visiting the City has other aims than the merely selfish one of filling its own pockets. Horticulture as a great national industry, as important in some ways, if not more so, than Agriculture itself, is not recognised by the public in general as anything more than an agreeable pastime, or a means of contributing to the luxuries of the few. It is time that business men, at any rate, should realise that Horticulture has a very high place in the commerce and industry of the country.

That a flower show is a beautiful spectacle, we all admit; that it is a good object lesson horticulturally is true also; but if the lessons deduced and the sentiments inspired are all rendered subservient to the one desire of some individuals—to get gold—how utterly must the show fail of all higher good. Even if such exhibitions did temporarily stimulate plant trading, the benefit would be felt in a very limited circle of trade, and possibly the results would be fleeting.

If we must have exhibitions of horticultural produce we must have some bold and national aims in view—aims which shall ensure national interest, and evoke national approval. The many Chrysanthemum exhibitions held in the country (and they are legion) have all a prize-winning or money-getting basis, but still they have done much to inspire a wide interest in the flower. Again, the ease with which the Chrysanthemum can be grown has in turn helped to stimulate the existence of these shows; but this reciprocity has not been found so largely in relation to any other plants; and, if every Chrysanthemum Society were to die to-morrow, the flower would remain as popular and be as widely grown as ever; indeed, we could no more dispense with our Chrysanthemums now than with our Roses, Apples, or Potatoes. Now, the great aim of all our shows should be the establishment of horticulture universally so firmly in the estimation of the people that exhibitions may be no longer regarded as essential aids, but as mere manifestations of what has become a solid and substantial element of our social life. In this direction there is no more worthy field open to the Council of the Royal Horticultural Society, if it wishes to do practical work, than the attempt to secure such a development of hardy fruit culture at home as shall enable us to compete with the foreigner in the amplest fashion. To secure a sale for a few plants may have a passing benefit, but to improve the hardy fruit trade of the kingdom by promoting fruit and vegetable culture at home would be to perform a patriotic and truly national benefit—one, indeed, which might in its development obtain the support of myriads otherwise unconcerned as to the welfare of the Royal Horticultural Society, or even of the horticultural trade. The Council has, we are informed, approached the LORD MAYOR of London for the purpose of getting his support of a flower show in the City, and has reason to be satisfied with the courteous and practical reception accorded it. It might be well also for the Council to invite the support of the City authorities, and especially that of the Fruiterers' Company, to the holding of a grand hardy fruit show and conference in the City during the ensuing autumn, with the object of inciting and stimulating landowners, farmers, and gardeners to plant the right sorts of Apples, Pears, &c., largely, that we may have at home an abundant supply of what at present we have to purchase so largely from abroad. While agriculture with us is paralysed an appeal thus made, which is irresistible, would carry with

it the sympathy and support of the nation at large. In such case we should see less of the pot-boiler influence operating and more of generous enthusiasm to assist in what would be a national object. The present year seems to be peculiarly a fitting one for the object in view. Never did the Royal Horticultural Society need an opportunity to perform great usefulness in the eyes of the nation—more than now. Here there is now a promise of a good fruit season, and the special object of the show should be to elicit from all parts of the kingdom such a response as shall enable consumers to see how far a supply of hardy fruits is already at hand here, and how much is lacking. It would, in pursuance of that object, be even desirable to have a section devoted to foreign grown fruits, that we might be able to compare the merits of fruit imports with our own products. Specially, as we find our chief competition in hardy fruits in the late autumn and winter, it would be desirable to hold the show not earlier than November, as by that time we should be in a good position to judge from the exhibits what were fitting competitors with the choice Canadian and American products. Very likely if we were in time to cut up that class of fruit trade, our export trade in some other direction would suffer, as of course Apples are not paid for in gold but in commodities. Still that could not be avoided, and possibly the home producer might become, on the whole, the best customer for other goods. What we have to look at first is the state of things at our own doors, and both charity and economy must begin at home; therefore if we can, through any instrumentality, aid in the widening of our home fruit trade, especially in the direction indicated, a very worthy and meritorious act will have been accomplished. There are other reasons also why the show might be well held this year. In the first place, Alderman DE KEYSER, as ample evidence was afforded in connection with the International Potato Exhibition, is a large hearted man, and specially has a fondness for gardening. Perhaps as a born Belgian he could hardly be otherwise. His successor in office will probably be Mr. Alderman WHITEHEAD, a gentleman having broad liberal sentiments, and something more than a mere City magnate; and should the show become a reality, and be held in November, then it would fall into Mr. WHITEHEAD's term of office. The City has but one available place for the holding of the show, and that is the ancient Guildhall, but even that spacious building would be far too small for the purpose unless the aid of the large annexe, which is always erected for the festivities of Lord Mayor's Day could be utilised also, and to gain the assent of the General Purposes Committee of the Corporation, for the use of these buildings during the week after the Lord Mayor's banquet, should not be difficult. The Fruiterers' Company should be approached and invited to give moral and pecuniary support. Probably, that body would be glad of the opportunity to show that it was something more than a name and had the interests of the fruit growers of the kingdom really at heart. A conference would be an indispensable feature of this gathering, because it is of the first importance the best information helpful to intending planters of fruit trees should be widely diffused, and if the matter were taken up in a worthy way immense good might result. Possibly, once again Horticulture might be recognised at the Mansion House as a worthy British institution, and that, if little, would be something gained. The chance is a great one, and if the Royal Horticultural Society Council finches, no doubt some other body will

GROWN AT THE HENDRE GARDENS, MONMOUTH.

strive for the credit. Another illustration of the commercial importance of Horticulture and of its relation to Agriculture is given in the report of the Notts Horticultural Society at p. 374, and to which we desire to call special attention.

DAFFODILS.—In our next number we intend to present our readers with a supplement in the form of a double-page engraving, representing a group of named Daffodils, from a drawing by Miss Bann. It is expected that most of the kinds will be exhibited on Tuesday next, at the meeting of the Royal Horticultural Society.

ROYAL HORTICULTURAL SOCIETY.—The next fortnightly meeting will be held on Tuesday March 27, at the Drill Hall of the London Scottish Volunteers, near St. James' Park Station, on the Underground line, and a few hundred yards distance from the new offices of the Society, at Victoria House, 111, Victoria Street, Westminster. All three committees will, we believe, meet in the Drill Hall—the Scientific Committee in the club-room up-stairs, the others in the hall. An excellent grill-room will furnish the means of luncheon. It is believed that a very good show of spring flowers will be held, as many of the leading exhibitors intend to give one more proof of their loyalty to the old Society, and that an attractive exhibition will be the result.

MEETING OF THE COUNCIL.—A special meeting of the Council was held on the 20th inst., when a report was read of the visit of the deputation to the Lord Mayor on the 10th inst., in reference to a proposed flower show to be held in the City in the month of May. A report of the Exhibition Committee was read in reference to the flower shows to be held in future in the Drill Hall of the London Scottish Rifle Volunteers, James Street, Victoria Street, Westminster; the first show to be held on the 27th inst. It was resolved that a special general meeting of the Fellows be called for April 10, to consider the new and amended bye-laws.

THE SCIENTIFIC COMMITTEE.—This committee will meet in the Drill Hall on Tuesday next, an arrangement which is decidedly inconvenient, as the library, which is largely made use of on these occasions, is in another building but, indeed it could hardly be made accessible on that day. Every allowance, must be made for imperfect preparations. The books and pictures will, it is supposed, be all removed from South Kensington to 111, Victoria Street, S.W., by to-day, and when that is accomplished, the Fellows will feel as if a heavy burden is taken from them. They will once more be free, and the Society left at liberty to do its work in its own way.

NATIONAL AURICULA AND PRIMULA SOCIETY (SOUTHERN SECTION), AND NATIONAL CARNATION AND PICOTEE SOCIETY (SOUTHERN SECTION).—It has been again decided to hold the exhibitions in connection with the Royal Horticultural Society; the former on Tuesday, April 24, and the latter on Tuesday, July 24. Owing, however, to the transition state of that Society the Council are unable to vote the usual grant of £15 to each Society as heretofore. Under these altered conditions, the committee trust that members and friends will try to make good this amount. By the kindness of a few friends an extra sum was collected last year as a Jubilee gift. It was under consideration to expend this sum in preparing cards for certificates on a new and original design, a sketch for which has been prepared by Mr. ALFRED SLOCOMBE; under the altered financial conditions, however, it has been proposed to postpone the preparation of the certificate cards. The committee suggest that if each member of either Society would obtain another by personal solicitation, a great success for the ensuing year would be assured. Mr. J. DOUGLAS, Barking Side, Ilford, Essex, is the Honorary Secretary.

NARCISSUS COMMITTEE, R.H.S.—Mr. C. R. SCRASE DICKINS, Hon. Sec., desires us to intimate that the meetings of this committee on March 27, April 10 and 24, and May 8, will be held in the new premises of the Royal Horticultural Society in Westminster, and that all plants and flowers intended for the committee should be sent to the Drill Hall of the London Scottish Volunteers Westminster, S.W., instead of to South Kensington.

THE HORTICULTURAL CLUB.—The usual monthly dinner of the Club took place at their rooms on the 13th inst. Mr. JOHN LEE in the chair. There was a large attendance of members. Amongst those present were Dr. Hogg, the Rev. F. Gale, Messrs. Llewelyn, Crowley, Harry J. Veitch, W. Bull, H. J. Pearson, A. H. Pearson, J. S. Consens, George Paul, &c. The discussion was opened by Mr. Llewelyn, who gave a most interesting account of Sikkim Rhododendrons in South Wales, and detailed many of the experiments which he is carrying out. As this was given from notes, it is impossible to reproduce his interesting remarks. A discussion took place afterwards, which was joined in by Dr. Hogg, Messrs. Veitch, Paul, Bull, and others.

Ghent CHAMBRE SYNDICALE.—At a recent meeting it was resolved that, in order to give to the representatives of horticultural industry of all countries the opportunity of extending their commercial relations and of discussing their common interests, a second international meeting of horticulturists should be held at Ghent from April 14 to 22. The dates of this meeting coincide with those of the Ghent quinquennial show; thus attractions will be afforded to the members of the meeting. A reduction of 50 per cent. will be allowed on the fares of the Belgian railways. A member's-ticket will be sent to each person attending the meeting which will enable him to partake of all advantages. Apply to M. le President du Meeting International des Horticulteurs de 1888 à Gand (Ghent), Belgium. At a meeting held on the 12th inst., the following awards were made:—

First-class Certificates.—To Mr. A. D'Haene, for *Lycaste plana* Measuresiana; to Mr. Jules Hye-Leysen, for *Cypripedium Argus* Moensi and for *C. Wallisi*; to Mr. A. Van Geert, for *Philodendron Andreanum*; to Mr. A. de la Devansaye, for *Anthurium Scherzerianum* Marie Thérèse; to Messrs. Desmet Frères, for *Epacris onosmaeflora*; to Mr. A. Peeters, for *Cypripedium Wallaertianum*; to Mr. E. Pynaert, for seedling *Clivia*; to Messrs. Vervae & Co., for *Cattleya Trianae* Louisa; to Mr. A. Van Inschoot, for *Odontoglossum Rossi majus* nilacea.

Floral Certificates.—To Mr. L. Desmet-Duvivier, for *Impatiens Hawkeri*; to Mr. J. Hye-Leysen, for *Cypripedium grande*.

THE GARDENERS' ORPHAN FUND.—It has already been announced that a dinner will take place on the day fixed for the first election to the Fund, on Friday, July 13. The sub-committee have arranged for the dinner to be held at the Cannon Street Hotel, at 5 p.m., and it is well it should be stated that no attempt will be made at the dinner to obtain funds. It is intended solely as a social gathering, at which the executive committee can meet such of the local secretaries and their country supporters who can make it convenient to attend the election. Further particulars will be announced in due course.

EXPORT OF PLANTS TO FRANCE.—Difficulties have arisen at Calais as to the certificates of origin required by the French Customs authorities in regard to plants, &c., exported to France from this country, and signed by English magistrates, but without the affix of any official seal or stamp. A correspondence has taken place between the Government of this country and that of France on the subject, copies of which have been forwarded to us for publication, the gist of the matter being that exporters will do well to obtain from the certifying magistrate, not only the signature, but an official

seal or stamp. The letter from the British Ambassador in Paris to our Minister for Foreign Affairs sums up the whole matter in the following terms:—

"Paris, February 22, 1888.

"My Lord,—With reference to your Lordship's despatch, No. 179, Commercial, of December 15 last, I have the honour to enclose herewith a copy of the reply which I have received from the French Minister for Foreign Affairs to the inquiry addressed to him in accordance with your Lordship's instructions by Mr. EGERTON, whether the French Government would be willing to give orders that the declarations required by the French Customs in regard to plants imported into France should for the future be accepted, although attested without seals. Monsieur FLOURENS states that he is informed by the Minister of Finance that the attestations of English magistrates are accepted, provided that they are self-evidently authentic, but that their authenticity cannot be considered as established beyond doubt unless they bear the seal or stamp of the official from whom they emanate, and that his Department could not without inconvenience deprive itself of this guarantee. I have the honour to return the original enclosure in your Lordship's despatch under reply.—I have the honour, &c.,

(Signed) "LITTON.
"The Marquis of SALISBURY, K.G., &c."

HOOKE'S "ICONES PLANTARUM."—Usually the plates and descriptions of plants in this publication are of purely botanical interest, but the March number contains in addition several which would attract the attention of horticulturists. The plates are devoted to the illustration of new and rare plants selected from the Kew herbarium, as the *Botanical Magazine* comprises those of the garden. The *Icones* thus forms an illustrated record of the most remarkable plants collected in the various Government expeditions, as also by travellers and missionaries in various countries. In the present number are figures of numerous plants from the Gilgit expedition and from Central China. The latter country especially proves very rich in novelties, and when the Orchid mania has ceased to monopolise attention it is to be hoped that some of our enterprising plant-importers will turn their attention to so fruitful a source of supply. The first plant, t. 1726—

Nanolirion capense, is what the French would call a "little droll of a plant," consisting of a thread-like rhizome like the runner of a Strawberry, giving off at intervals little tufts of linear leaves about 2 inches long, and in the centre of each tuft a short flower-stalk with one to three Crocus-like, purple flowers, each a little less than half an inch across. The structure of the flower shows them to be Liliaceous.

Satyrium princeps, t. 1729, is described as one of the handsomest of the genus, with bright carmine flowers deepening to crimson, the bracts a dull raw sienna, the scape reddish with dark green leaves. Mr. BOUL'S description ought to make an orchidist's eyes glisten. It grows near Port Elizabeth.

Tubœnia longipes, t. 1738, is a showy Bignoniad of arboreous habit, not a climber, as is usual with most of its allies.

Actinotinus sinensis, t. 1740, represents a new genus of Caprifoliis, described by Professor OLIVER, and is remarkable for having the digitate foliage of a Horse Chestnut (*Aesculus*), in association with the flowers of a Viburnum. The neuter flowers are enlarged and petaloid as in the Gueldres Rose. It is a native of Central China.

Decumanus sinensis, t. 1741.—Apart from the great interest attaching to it as representing a genus hitherto known from the south-eastern States of North America, this seems likely to make a handsome creeper or wall plant, allied to Saxifrages and with obovate leaves and terminal heads of white fragrant flowers. Like the former it is a native of Central China.

Hamelis mollis, t. 1742, is like the other species of the genus, but has leaves downy on the under surface. Central China.

Chrysosplenium mucrophyllum, t. 1741.—Those who know our pretty little bog plants will stare to see

this Chinese representative with its large battledore-shaped leaves.

Crera tenax, t. 1748, from Natal, is remarkable for supplying abundance of fibre of good quality.

Abutilon sinense, t. 1750, from Central China, is such a handsome species that Professor OLIVER wonders "that a species so conspicuous and suited for home-cultivation, should have escaped us so long." It is a shrub or low tree with yellow flowers, $1\frac{1}{2}$ to 2 inches across. Native of South-west China.

RHODODENDRONS.—Dr. BREITFELD, in ENGLER'S *Botanische Jahrbuch*, has published the results of his investigations into the leaf-structure of Rhododendrons and their geographical distribution. Dr. BREITFELD groups the various species under various heads according to the construction of the epidermis, the relative size of the water-cells, the folding of the cuticle on the under surface, the nature and amount of the hairy or scaly covering, the number of raphides, the presence or absence of pitted cells, &c.

MALESIA.—From time to time we have called attention to this valuable publication of the eminent botanist and traveller, Signor BECCARI. This has been devoted to the description and illustration of the plants of New Guinea and other islands in the Malay Archipelago, and is of very great botanical interest. The Italian Government has seen fit to withdraw the slender encouragement it accorded to the intrepid traveller and scientist, and the work would have ceased with the publication of the plates of the *Durioneæ*, a highly important and curious group of Malvaceæ, monographed by Dr. MASTERS in the *Journal of the Linnean Society*—had it not been for the Bentham Trustees, who have, we learn, resolved to devote some portion of the funds bequeathed to them by the late Mr. BENTHAM towards the completion of Signor BECCARI'S work.

ROYAL PARKS AND PLEASURE GARDENS.—A return moved for by Mr. PICKERSGILL, M.P., was issued lately, giving the areas, uses, &c., of the Royal Parks in the United Kingdom. Battersea Park, which covers an area of 199 acres, is practically entirely devoted to the public, only about 2 acres being reserved for frame ground to propagate plants and for necessary buildings. Bushey Park contains 994 acres, but from a large portion of this the public are excluded. No fewer than 104 acres are kept as meadow land for hay, and 55 acres for timber, and these 159 acres produce the small revenue of £91 per annum. Then there is a reservation of 75 acres for the Royal paddocks, 36 acres for enclosures for deer, and the total reservation amounts to about 320 acres. Greenwich Park contains 185 acres, almost all devoted to the public; and Hampton Court Park, with an area of 752 acres, is wholly unreserved; and the same may be said of Hampton Court Green (17 acres), and Hampton Court Enclosure Gardens (42 acres). Hyde Park, with 360 acres, is also practically unreserved; and the public have equal freedom in Kennington Park (19 acres), Kensington Gardens (274 acres), Kew Gardens (248 acres), and Regent's Park (472 acres), the largest reservation in Regent's Park being 31 acres for the Zoological Gardens. Other portions also are let, bringing in a total revenue of £234 18s. 10d., to which £358 0s. 9d. is contributed by the Zoological Society. There are also the four contributions to the revenue—Baptist College and grounds, £273 8s. 9d.; St. Dunstan's Villa and grounds, £256 16s. 7d.; St. John's Lodge and grounds, £234 2s. 3d.; Botanical Society's gardens, £360; and South Villa and grounds, £333. There are also some smaller tenancies, which make up the total. Richmond Old Deer Park, containing 363 acres, is not open to the public at all, and produces a revenue of £972. Richmond and Petersham Parks cover 2470 acres, but from these the following reservations are made:—Plantations, 142 acres; mowing ground, 104 acres; deer paddocks, 137 acres; Ranger's meadow, 20 acres; arable land for growing roots for deer, 18 acres. There are several minor areas from which the public are excluded, and the

revenue per annum is set down at £400 for the sale of timber, and £100 for feeding cattle. St. James' Park (93 acres) and Victoria Park (212 acres) are unreserved, but from Windsor Great Park, which covers 5300 acres, no less than 1395 acres must be deducted from which the public are excluded. The revenue of this park is also *nil*. Windsor Home Park consists of 75 acres, with no restrictions to the public. Other parks in the kingdom are mentioned, the largest being Phoenix Park, Dublin, which covers 1752 acres, and of which area 421 acres are reserved for the Vice-regal Lodge and other Government purposes.

FOREST FIRE AT CAPE TOWN.—Our Cape Town correspondent informs us of a most disastrous fire which raged on the north-western slope of Table Mountain, on February 26. Thousands of young trees were utterly destroyed and the undergrowth reduced to ashes. The fire soon reached the outskirts of the virgin forest on the western Van Breda estate. Seven years ago this forest was destroyed by fire, but Mr. BRÉDA who is a forester of great reputation and well-known energy and taste, replanted the whole of the estate. Valuable Australian trees, a number of young Sycamores, promising Oaks, and many splendid example of the mountain Pine, had sprung into existence, and the beautiful virgin forest that ornamented the rough slopes of this part of the great mountain was the admiration of every visitor to Cape Town. Mr. BRÉDA seldom, if ever, visited this portion of his estate without dropping a few seeds, and his experiment in the culture of trees were being watched with interest. Seven years' undergrowth, too, had sprang into life, and this was the medium of supplying thousands of gallons of water during the year to the reservoirs of Cape Town.

"THE BRITISH UREDINEÆ AND USTILAGINEÆ."—Mr. CHARLES B. FLOWRIGHT intends to bring out a work on this subject as soon as the requisite number of subscribers has been obtained. It will comprise descriptions of the British species of these fungi, and will also give a full account of their biology, as far as this is at present known, including the methods of observing the germination of their spores, and of their experimental culture. Intending subscribers should communicate at once with Messrs. KEGAN, PAUL, TRENCH & Co., publishers, 1, Paternoster Square, London. The interest of these plants from a cultural point of view is so great and the extraordinary phenomena of their life-history so little known, though of such great importance, to cultivators, that we hope Mr. FLOWRIGHT will receive every encouragement in his useful labours.

"NOMENCLATOR FLORÆ DANIÆ."—The *Flora Danica* was commenced by G. C. OEDER in 1761, and the work was completed by Professor LANGE in 1883. During the interval various Professors have acted as editors. The work now comprises more than 3000 illustrations, with descriptions of the plants, not only of Denmark, but of Scandinavia generally, Iceland, and Greenland. Nothing more need be said to indicate its value to botanists. The work was more than a century in progress, and during that interval many changes in nomenclature have naturally been necessitated, either by increase of knowledge or as a result of different ways of looking at things. A general index has, therefore, become a necessity, and this Professor LANGE has supplied in the publication before us. The *Nomenclator* comprises first of all a list of the plates in order, as they were published, and with the names then employed, together with the names as now accepted. Numerous annotations follow. Next comes a systematic enumeration, according to the natural orders, of the several plants with references to the plates and to the occurrence of the plants in one or more of the countries already mentioned. Lastly comes an alphabetical index of all the plants figured. A little bit of political history comes in unexpectedly in a scientific publication, when we are told that while at the outset the text was written in Latin,

German, and Danish; after the year 1864, when the Duchies were taken from Denmark (*ducatibus a monarchia Danica dirruptis*), the German tongue was no longer employed. As not only the flowering plants but the Cryptogams are included, this index, even apart from the plates, will be of the greatest service to botanists.

TEA CULTIVATION.—Indian Tea now forms 50 per cent. of all the Tea used in this country, whereas no longer ago than 1865 China furnished 97 per cent. According to an article in *Nature* the Australians consume 81 oz. per head of the population, English people 73 oz., while the inhabitants of the United States come next with 21 oz., those of Russia, Belgium, Holland, and Denmark consume only from 7—8 oz. per head of the population. Unfavourable contrasts are sometimes drawn between the services rendered by botany and botanists to the State, and those rendered by chemists and engineers. The botanists, however, can show a good record—Indian Tea, Cinchona, Cotton, India-rubber, Gutta-percha are all substances, the development, and, in some cases, the discovery of which was due to botanists, and their culture to horticulturists.

ARAUCARIA BIDWILLII.—Mr. WATSON, of Kew Gardens, writes:—"A correspondent at the Cape sends me the following note of a cone produced by a tree cultivated in a garden in Uitenhage, near Port Elizabeth:—"The largest cone of *A. Bidwillii* I have ever seen was exhibited last week at the Town Hall here. Its height was 10 1-16th inches, its circumference lengthways 30 inches, its diameter at its thickest part 8 inches, with a girth of 26 inches, an irregularity not often met with; its weight was 9 lb. This truly marvellous cone fell from a tree growing in front of Mr. G. BLACK'S house in Cuyler Street while a strong gale was blowing."

THE HAIRS OF THE PLANE.—Mr. HILLIGER, a German living at Barcelona, in the monthly *Proceedings of the Natural History Society*, writes on the influence of *Platanus* on the health. For years past Mr. HILLIGER and his household have regularly every spring been afflicted with severe coughs. On examining microscopically a portion of the expectorated matter he found it full of remarkable star-shaped bodies, apparently of the same nature as the dust which was resting on the window-sill. Further research showed that these forms were, in fact, identical with those found on the young foliage of *Plane* trees, and which, to the naked eye, appear like fine, dusty, shining, star-like hairs. Hence it is inferred that this dust falling from the *Plane* trees which surround Mr. HILLIGER'S house in a double avenue is the cause of the prevalent coughs. Moreover, the *Monatlichen Mittheilung* remarks that the fact of the evil influence of *Planes* upon the health, though but little noticed now, was well understood by the ancients. DIOSCORIDES mentions the fact, and GALEN more especially refers to the manner in which the dust from *Platanus* leaves irritates and dries, not only the throat but also the eyes and ears. It would be interesting if those people who live in districts where *Plane* trees have been largely planted would make and record their observations on the prevalence of coughs in those districts. There is much wisdom in the sayings of the two old physicians. GALEN remarks:—"We must guard against the dust from *Platanus* foliage, because if we draw it in with the breath it irritates and dries up the wind-pipe, injures the voice, and the eyes and ears if it enter them." DIOSCORIDES, in the 107th chapter of the first book of his *Materia Medica*, states that the dust from *Platanus* leaves and fruit balls "does harm, if it reach them, both to the organs of hearing and of vision." Moreover, the late Professor KARL KOCH, in his work, *Trees and Shrubs of Ancient Greece* mentions that in PLATO'S *Phædrus*, in the description of the *Plane* tree under which SOCRATES and PHÆDRAUS were conversing, reference is made to an injurious "perfume" exhaled by *Planes*. Respecting this, KOCH remarks:—"This fragrance arises apparently from fine

hairs which, as the leaves unfold, fall from their under surface and which are injurious to the eyes and produce an unpleasant rough feeling in the œsophagus. A contributor to the *National Zeitung*, refers to the matter as follows:—"The injury to human health caused by Plane trees is by no means unknown. It is said that three years ago the planting of Plane trees in the neighbourhood of school-buildings was forbidden in Alsace-Lorraine." Both species of *Platanus* (*Platanus orientalis*), the Eastern variety, and the Western species (*P. occidentalis*), and which originated from America, possess these starry hairs. At first they cover both leaves and pedicels, but fall off when they have fulfilled their mission, which is that of protecting the young and tender organs from the external influences of frost and wet. The young foliage of other trees, such as the Linden (*Tilia*) and some Oaks (*Quercus*) is similarly hairy in the spring. The Bernstein Oaks more especially have this peculiarity, so that where they grow the atmosphere in spring must be much charged with these star-like hairs. The old Greeks apparently did not attach much importance to the harm done by Plane trees as known to them. They planted this splendid tree in preference to others, not only in their cities, but also in the suburbs. A contributor to the *Rundschau*, whence we take the above notes, remarks that it would be interesting to find out whether, in districts where the genus *Levkoyen* (Stocks) is largely cultivated, as in Erfurt, for example, people are subject to unusual coughs, or lung diseases in the spring or summer, as the scales on the leaves of *Levkoyen* bear a resemblance to those of *Platanus*.

THE GLOUCESTERSHIRE ROSE SOCIETY.—A large and influential meeting of ladies and gentlemen of the city and county was held at Gloucester on Saturday last, the 17th inst., for the purpose of starting a Rose society for the county, the result of the meeting being the formation of the above Society, which promises to be exceedingly well supported. Mrs. GAMBER PARRY, of Highnam Court, Gloucester, was unanimously elected President, and several ladies and gentlemen of the city and county have consented to become patrons and patronesses. An influential committee was appointed, and the Rev. T. HOLMES, Sandhurst Vicarage, Gloucester, and the Rev. F. R. BUNNISE, Chipping Campden, were elected Hon. Secretaries. Mr. HATFIELD, manager of the National Provincial Bank, Gloucester, was appointed Hon. Treasurer. The first show of this new Society will be held in the Corn Exchange, Gloucester (a room admirably suited in every way for a Rose show), on Thursday, July 12. The committee hope to be able to frame a liberal schedule, which will be issued by the end of April or the beginning of May.

MR. CHARLESWORTH'S ORCHIDS.—Mr. CHARLESWORTH, of Bradford, having completed the building of his Orchid-houses, is about to throw his nursery open for the inspection of the public for one week (Sunday excepted).

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN.—The prize schedule for the grand floral *fête* to be held under the auspices of this Society in the Duthie Public Park, Aberdeen, on August 24 and 25, has just been issued. Hitherto the Society has held two exhibitions during the year, but at the annual meeting it was decided that one grand exhibition should be held this year. The schedule, which is neatly got up, extends over fifty pages. There are 284 classes, divided under four heads—plants in pots, cut flowers, fruit, and vegetables. The table of horticultural produce will again form a feature of the show. A good many additional classes have been added for Ferns, Orchids, Chrysanthemums, Vines in pots, annuals, Potatos, fruit, &c. The entry form has been simplified, and made more comprehensive. The total number of prizes is 853. A large amount of the prize-money has already been collected through the efforts of the Chairman of the Society, Town Councillor LYON. The Secretary is Mr. A. M. BYRES, C.A., 21, Bridge Street, Aberdeen.

PRESENTATION TO THE SECRETARY OF THE ANCIENT SOCIETY OF YORK FLORISTS.—At a meeting of the Ancient Society of York Florists, held at the "Golden Lion" Hotel, Church Street, York, recently, Mr. JOHN LAZENBY, the Secretary, was the recipient of a token of esteem and

goodwill. Mr. G. COWPER, who presided, made the presentation. He reviewed the history of the Society, and alluded to the great services which Mr. LAZENBY had rendered in these its latter days, when its usefulness was very great. Others added complimentary expressions to those uttered by the Chairman, after which the testimonial, consisting of a purse of gold, was handed to Mr. LAZENBY, who suitably acknowledged this kindly recognition of his services.

THE COVENT GARDEN CLUB.—This Club was opened on Wednesday evening last by a concert at the Covent Garden Hotel (where the Club is located), there being a large and enthusiastic gathering—Covent Garden salesmen and country growers being largely represented. The President, Mr. J. B. THOMAS, announced that upwards of eighty members were already enrolled, and there was every prospect of the number being largely increased. The Club has been promoted chiefly for the accommodation of salesmen in Covent Garden Market, and of growers and senders of produce from the country.

SCOTLAND.

EDINBURGH BOTANICAL SOCIETY.

(Continued from p. 344.)

On Temperature, Vegetation, &c., at the Botanic Garden, Glasgow, for February, 1888. By R. BULLEN, Curator.—The sharp frosts which were experienced at the end of last month discontinued after the night of the 1st of the present month, when 5° were registered. The effects of the earthquake, which was distinctly felt here about 5 o'clock the following morning, seems to have changed the temperature, for no more frost was recorded until the night of the 9th, when the temperature, which had been unusually high, again fell to the freezing point. From this date to the close of the month frost has been registered on nineteen nights—from the 10th to the 18th severe. Since then 3° have been the lowest record on any one night. The total record for the month is 88°, of which 10° were registered during the night of the 11th, and 16° during the night of the 15th. Vegetation was in a forward state during the early part of the month. Several hardy deciduous trees were also showing signs of early bloom, the catkins of the common Hazel being both early and unusually numerous. A Japan Quince, although growing in an exposed situation, had developed numerous young leaves; also the variegated form of the common Elder and *Elæagnus mucronophyllus*; while Lilac, Ribes, and Roses were just bursting their leaf-buds, so that the visits of Jack Frost at that time proved quite opportune.

On Vegetation, Temperature, &c., at the Royal Botanic Garden, Edinburgh, for February, 1888. By Mr. R. LINDSAY.—The past month has been exceedingly wintry. Frost was registered on twenty-three mornings indicating collectively 121° for the month as against 76° for the corresponding month last year. The lowest readings of the thermometer were on the mornings of the 12th (when the glass fell) to 18°; 13th, 23°; 15th, 24°; 16th, 9°; 17th, 21°. The lowest day temperature was 34° on the 24th, and the highest was 52° on the 8th of the month. Snow began to fall on the 12th. On the 13th there was a fall of about 5 inches, and renewed falls more or less heavy occurred at intervals till the end of the month. Vegetation, which had started rather early in consequence of the mildness of the previous month, received a decided check. This has been beneficial, rather than otherwise, in the present case, the amount of snow which had fallen having preserved plants from injury. Various half-hardy plants are, as yet, uninjured in the open ground. The following spring plants annually recorded came into flower, viz.:

- | | |
|-----------------------------------|-----------------------------------|
| Feb. 3. <i>Rhododendron atro-</i> | Feb. 11. <i>Nordmannia cordi-</i> |
| <i>viridum</i> | <i>folia</i> |
| " 4. <i>Leucocium veranum</i> | " 22. <i>Bulbocodium verum</i> |
| " 6. <i>Arabis alba</i> | " 22. <i>Daphne Mezereum</i> |
| " 8. <i>Symplocarpus foeti-</i> | " 23. <i>Crocus vernus</i> |
| <i>dis</i> | " 23. <i>Iris reticulata</i> |
| " 9. <i>Tussilago alba</i> | |

On the rock garden twenty-nine plants came into flower during the month as against forty-five during February, 1887. The finest in blossom were:—*Muscari lingulatum*, *Iris histrio*, *I. reticulata*, *Leucocium carpatium*, *Galanthus Elwesii*, *G. plicatus*, and *G. Redoutei*, *Chionodoxa sardensis*, *Colchicum crociflorum*, *Crocus Imperati*, *C. ananulatus*, and *C. Sieberi*, *Erica herbacea* and *E. herbacea alba*, *Hepatica triloba*, single and double varieties.

VEGETABLES.

EXHIBITION ONIONS.

The Onion has come to play almost as important a part on the exhibition table as the Potato. Several new varieties have been introduced of late, and some of these have been grown to a prodigious size. When the Onion contest at Banbury was at the very height of its popularity a dozen bulbs would weigh 14 lb. to 14½ lb.; now they can be got to 18 lb. and 20 lb. the dozen, and the new variety, the Cocoa-nut (which is stated by the raiser to be a large growing selection from Cranston's Excelsior), if the seed be sown in August or September on a bed, and transplanted to the open ground in February, will, with careful culture, produce bulbs 2 lb. to 3 lb. in weight. A dozen bulbs of this variety staged at the Chrysanthemum show at Banbury in November last were of very large size, and handsome. Though in appearance it seems to partake of the character of the imported Spanish Onion, it is said to be a very good keeper.

In order to have fine exhibition Onions, the best growers recommend that the seed should be sown as early as October. Having selected the site for the bed, the first spit of soil is dug out, leaving a trench the soil below that removed is forked up, and 6 to 8 inches depth of rich rotten manure placed upon it; and then the soil which was removed is placed back upon the manure. This bastard trenching goes on until the whole of the bed is manured in this manner, and then it is allowed to lie until January. In that month a good dressing of soot is given; it is found very helpful, not only as a stimulant, but it is destructive to grubs and other insects. Two or three days after the bed is lightly forked over, when the weather is favourable, and the surface made firm. The seedlings and the seed having been sown in pans or boxes in October, are re-transplanted to this bed in March, the soil pressed firmly about them. They are well watered when the weather is at all dry; indeed, one of the secrets of successful Onion culture is giving plenty of water, and one noted grower will water profusely even when rain threatens. Growers appear to differ about the utility of top-dressing the Onions; one very successful exhibitor top-dresses with well-decomposed manure from spent Mushroom-beds, another does not apply any surface stimulant beyond an abundance of water. As a matter of course, the largest, and, at the same time, the heaviest and handsomest bulbs, are selected for show purposes, and when they are pulled, and turned neck downwards on a rack, to admit of any juices freely running from the necks. How far high-class culture goes in the direction of increasing the size of Onions was abundantly shown on several occasions at South Kensington during 1887. R. D.

PLANTS AND THEIR CULTURE.

FERNS.—Many of these are showing signs of starting into fresh growth, and no time should now be lost in potting any which may require it, and top-dressing others; but if the potting cannot be done before the fronds are too far advanced, it is better to defer it till those fronds are a little matured. These remarks apply chiefly to *Adiantum*, *Pteris*, *Nephrodium*, and *Gymnogramma*; but those species with creeping rootstocks, such as many of the *Davallias*, *Gleichenias*, and *Aerostichums*, may be potted at almost any time during the growing season. *Adiantums* are those which will first require attention.

They present no difficulty in growing them to a large size in a comparatively short time, provided as much light and exposure as possible be afforded them. Do not let them become dry at the roots, neither must they become sodden, which would prove as fatal to them as dryness. If the back wall of the house be of soft stone, Ferns will plant themselves there, and grow with freedom, their brown fibry roots spreading over all, showing that, although they like moisture at the roots, they enjoy abundance of air. The compost employed, should consist of a soil which, while affording a firm foothold, like the stones, will at the same time be porous enough to admit air to freely percolate the ball, and be composed of friable loam, with one-fourth of fibry peat and chopped sphagnum—the refuse from the Orchid potting-bench is admirable when chopped up fine enough to go through a quarter-inch sieve; the remaining quarter of the compost may be sharp silver-sand and charcoal broken up rather finely, with a sprinkling of bone-dust. In potting, see that the drainage is thorough, and for the usual kind of pot one-fourth in depth should consist of drainage, and which should have a layer of sphagnum or fibry peat placed over it. If the compost is neither too light nor too adhesive it will be impossible to make it too firm in the pots, and difficult to render it sodden afterwards. Reduce the old ball of the plant by shaking it, or cut it down to the desired size with a knife, leaving the solid mass of the middle intact. If the crowns of the plants have become very large it is better to cut them up into the required size. After potting the plants should be dewed occasionally, but Ferns of this class dislike syringing, as it causes decaying of the inner fronds, and should be avoided if possible; but the stages, paths, and all available surfaces should be frequently damped. For the stove-kinds a temperature of 60° at night, rising to 75° in the daytime will be ample. The greenhouse kinds should be kept at ordinary greenhouse temperature, and both sections require air to be given freely, but not so as to create a draught. Fronds produced under these conditions have more substance, and do not shrivel up nearly so soon as fronds which have been produced in a close atmosphere, and under heavy shading; the shading employed should be of the lightest and movable. *F. Ross, Pendell Court.*

MANGO GRAFTING.

There are Mangos and Mangos—some not inaptly described as a mixture of tow and turpentine, while we do not remember anything more delicious in the way of fruits than one particular Mango—it was but one—that came to us from Jamaica some years ago. This difference being so marked it is no wonder that our Indian fellow subjects take care to graft upon the wild stock scores of the best varieties or of those found by experience to be the best suited to particular localities. How it is done is shown in our illustration (fig. 57), for which we have to thank Mr. Woodrow.

The natives are so deft in the use of their fingers that the clumsiness of their tools seems rather surprising.

HOME CORRESPONDENCE.

COPYRIGHT OF FRUITS.—The *Gardeners' Chronicle* never fails to take a keen and lively interest in all matters which may advance the well-being of horticulture. The question of the copyright of seedling fruits having attracted its attention proves that it is worth consideration. The result of a copyright protection may be more important than appears on the surface, for there is no finality in the excellence of fruits, and a knowledge that the right of property may exist for a given time will lead to the adoption of a more scientific method than the present haphazard system. It is our duty to leave the world better than we found it, and what is more enduring than a good fruit? Some philosophers hold that an excessive civilisation will result in a return to first principles. It will be a comfort to know that our remote descendants, when they have returned to the prototype, "a hairy quadruped with pointed ears and a long tail," probably arboreal, will have something better to chatter over than the hips and nuts of the primeval forest; and that a part of their gratitude may be earned by the improvement of fruits

is the anxious desire of their ancestor, *T. Francis Rivers*.

BEGONIA LUBBERSII AND B. ARGYROSTIGMA.—"Mediocriter" does not know *B. argyrostigma*, or he has not made a comparison between it and the figure of *B. Lubbersii* in the *Gardeners' Chronicle*, p. 301. The two are widely distinct. *B. argyrostigma* is synonymous with *B. maculata*, which has leaves 6 to 8 inches long by 2½ broad, the upper surface shining green, with roundish blotches of silvery-green, and the under surface is purple. In form it is ovate, obliquely cordate (*i.e.*, there is a division in the blade from the side to the petiole). The flowers are in long drooping clusters, and they are coral-red. It is unnecessary to compare this description with the figure and description given of *B. Lubbersii*, in which the leaves are small, petate, the blotches very irregular, and the flowers, which are white, are crowded in the apex of the shoot. Certainly *B. Lubbersii* is a well marked plant, totally different from *B. argyrostigma*, and as far as I know from all other cultivated Begonias. *W. Kew*. [We have letters to the same effect from Count de Kerchove, Mr. Lubbers and others, Ed.].

CYMBIDIUM ELEGANS.—I think that the statement at p. 331, that *Cymbidium elegans* seems to be but a variety of the well-known *C. eburneum*, should not be allowed to pass unchallenged. *C. eburneum* has erect spikes bearing one or two large well-expanded white flowers, while *C. elegans* has long nodding racemes of comparatively small partially closed yellowish flowers, often fifty to eighty on an inflorescence. To me the two species named represent extremes of the genus, and I await further information from the writer of the paragraph on the subject with interest. The statement, too, that the plant grows freely among the *Odontoglossums* requires qualification—it all depends how warm the *Odontoglossum*-house is kept. If kept cool, as that term is generally interpreted, none of the *Cymbidiums* will be safe there. *James O'Brien*.

CLIVEA MINIATA VARIETIES.—As a winter bloomer this is a plant which should not fail in any garden, but yet it does not receive all the attention it merits as a decorative plant in pots or when the flowers are cut. It may be seen treated as a stove plant, which it assuredly is not, although during the earlier stages of growth the moisture and temperature of a stove suits it admirably, but it is more at home in an intermediate-house than in that, for when making its growth a night temperature of 55° to 60° will be found high enough. As a cool greenhouse plant it is scarcely worth house-room, although after it has matured its growth it will do perfectly well in a temperature of 40°, provided it does not receive too much water. Its usual season of blooming is the months of February and March, but so accommodating is it, that it may be bloomed all through the winter months (not the same plants, but by introducing a few every two or three weeks). The *Cliveas*, not being bulbous-rooted, must never be dried off in the same manner as their allies, the *Amaryllis*. They grow well in a mixture of two-thirds good fibry loam, one-third leaf-mould and sand, with a little charcoal added to the soil. The pots must be well drained; one-fourth of the depth, at least, should be given up to drainage. The best time to repot is just after the plants have done flowering, when large masses may then be successfully broken up into single crowns. This requires to be done with caution, so as to damage the roots as little as possible. Place the stronger crowns singly in 6 or 7 inch pots. If it be desired to grow larger specimens, shift on into pots 4 inches larger than those they now occupy, without disturbing the roots more than by merely removing the crocks and any old soil round the neck of the plant. As soon as potted place the plants in a temperature of 55° to 60°. I grow mine on the back shelf of a Peach-house. If the plants have been placed in suitable compost it is not necessary to shift them every year. Those I have, frequently burst their pots before they are shifted. When the plants are growing freely water twice a week with weak manure-water, and the treatment accorded Peaches just suits them as regards syringing. As the days shorten lessen the supply of water at the root and discontinue syringing. In November plants may be introduced into a temperature of 50° to 55° when the flower-spikes will soon be thrown up. When coming into bloom place them as close to the glass as possible facing the sun. Grow in 6, 7, and 8-inch pots and thus treated, they form striking objects in a conservatory or as house decora-

tive plants. Treated as greenhouse plants and allowed to come into flower in that structure the blooms are deficient in size and in colour. Some new and striking departures in form and colour may be expected from the Continent shortly, as great progress has been made in cross-fertilisation, and it is anticipated that ere long a pure white form will be obtained. There are, however, many new forms of this gorgeous and long-lasting flower already in commerce. The following are amongst the best forms which have been obtained by selection and hybridisation:—*Clivea Meteor*, *C. cruentum*, *C. Martha Reimers*, *C. Baroness Schroeder*, *C. Van Houtte*, *C. miniatum splendens*, *C. m. princeps*, *C. Ambroise Verschaffelt*. There is not much difference in point of colour, as most of the varieties may be classed as orange-scarlet or orange-vermilion, with a yellow colour at the base of the petals. The most important distinction noticeable from the old *miniatum* is the depth and width of the perianth. *W. M. Baillie*.

NEW DEPARTURE IN CHRYSANTHEMUMS.—The first number of the *American Garden and Forest*, just to hand, contains a photographic reproduction of a large white Chrysanthemum, named Mrs. Alphens Hardy, the broad incurved florets of which are studded with large glandular hairs, almost spinose in their general appearance. It seems to be a decided advance or new departure, and a Japanese botanist who saw the variety in America says it is distinct from anything he remembers to have seen in Japan. It came direct to Mrs. Hardy from Japan as one in a set of thirty varieties sent to her on his return home by a Japanese student whom she had befriended in America. The flower as figured has a very peculiar appearance, and a friend who saw it suddenly exclaimed, "Why, here's a Chrysanthemum like a Sea Anemone crossed with a Star-fish!" and the flowers really do convey a suggestiveness of this kind and character. The glandular hairs are rather thickly set on the backs of the florets, and are about one-eighth of an inch long, curved like letter s or f. They are unbranched, and built up of cellular tissue, each being terminated by a drop of gum or resin at its apex. We are not told if the flower is fragrant. Judging by the picture this variety is perfectly unique, and it is one of those surprises we are now-a-days half expecting to see from Japan. It was exhibited in December last at the Chrysanthemum Show in Boston, U.S.A., by Edwin Fewkes & Son, of Newton Islands, Mass. It is difficult to predict what may not come to pass when this curious variety gets into the hands of the French raisers of new Chrysanthemums. *F. W. Burbidge*.

UTRICULARIA LONGIFOLIA *alias* **U. CHYTROPHYLLA.**—The plant shown under the latter name by Sir Trevor Lawrence at the last meeting of the Royal Horticultural Society was the true *U. longifolia*. Flowers from a sister plant were sent to Kew for determination by Mr. Sander, and were named by Professor Oliver. *U. longifolia* was described by G. Gardner in Hooker's *Journal of Botany*, vol. i., 1842, and was one of the new plants found by Gardner himself when collecting in Brazil. He states that it grows in moist places and flowers in November. The leaves are from 5 to 10 inches long and 1 inch wide, and the scape is erect, a foot or more high, bearing flowers with large violet corollas and a short spur. Who is the author of the name *chytrophylla*? *W.*

EXTRA EARLY VERMONT POTATO.—Mr. Murphy has over-estimated the date at which this American Potato was introduced, as I think on fuller inquiry it will be found to have been within thirteen years; within that period, indeed, scores of American Potatoes came and went, and now the only one having any considerable reputation is the famous Beauty of Hebron, which stands in higher favour in this country than did either the Early Rose or Snowflake. The Early Rose had obtained a good measure of popularity ere the Extra Early Vermont turned up. Very likely it was a natural seedling from the Rose; in any case, it was so uncommonly like it that only by keeping them separate and named, could the difference be discovered. Shortly, however, the Vermont became absorbed in the Rose, and still later the better Beauty of Hebron elbowed out the others, so that now little is heard of "Roses," and little of "Beauties." As to the latter kind, I think that, too, will presently give place to its white-skinned sport, Duke of Albany, or white Beauty of Hebron, simply because the tubers of the latter have white skins, yet remaining Beauty of Hebron all the same. This early American kind seems to have further elbowed out the Ashleaf Kid-

ney in the market trade generally: for 100 tons of the former are grown to 1 ton of the latter. A. D.

— Mr. Murphy's statement in a recent number of the *Gardeners' Chronicle* about the above, that it is not to be found in the catalogues of the present day, except that of Messrs. Cannell & Sons', is not at all surprising, seeing that there is no difference between it and Early Rose. I grew a Potato under the above name about ten years ago, and after growing it separate for three seasons I mixed the produce of the two together, and failed to find any difference. Mr. Murphy says that it is good on light sandy loam, but there is always that objectionable pinky streak to be found running through some of the tubers which you find in Early Rose. Beauty of Hebron I consider far in advance of Early Rose, so have discarded the latter in favour of the former. Is not Mr. Murphy mistaken when he alleges that Extra Early Vermont was grown here forty-two years ago? —as I have an impression it was sent out about the same time as Early Rose, which certainly has not been grown in England for so long a time as that. I have grown a great many of the American varieties,

the number of 500, in at least half that number of varieties. From, therefore, several years' experience, I radically differ with Mr. Horsefield in at least two points. Japanese are not too tender; they do as well as any other with me, while the shape and form, but especially the colours, come much best in the open air. When cut they hold perfect for weeks together. 2. I propagate most of my plants in boxes from cuttings, but rooted offsets do admirably. I never think of planting whole potfuls together — this would spoil the chance of success. This system, rest assured, has a future. *W. J. Murphy, Clonmel.*

THE ORIGIN OF EVERGREENS.—In the report of the paper read on this subject by Mr. P. Geddes (p. 278) there seem to me to be some questionable statements, such as, "It is well known to every gardener that plants generally deciduous will in certain favourable winters persist as evergreens." It would have been more satisfactory if the essayist had given the names of a few of the plants that behave like this. [*Ligustrum sinense ovalifolium*. Ed.] He says also: —"Again, plants which in one country are deciduous

which I had not met with, until kindly forwarded through several correspondents. I do not understand Mr. Brockbank to affirm that all Solomon's Seals are fragrant; after the proof afforded no one can deny that there is a sweet variety, and it proves a most welcome addition to the hardy flower bed or border, as well as a valuable plant for forcing alike for its grace and its fragrance. *D. T. Fish.*

TOBACCO CULTURE IN SCOTLAND.—Some interesting, if unobtrusive, experiments have been carried out this last season in the growing of the Tobacco plant by Mr. Barron, gardener to Mr. R. C. Urquhart, of Meldrum, Aberdeenshire. About four poles of garden ground, with a south-westerly exposure, were planted out, the drills 2 feet apart, and the plants every 18 inches in the drills (though it is said 3 feet each way would give a thicker leaf). The manure used was—first, farmyard along with artificial, rich in potash; on another part the artificial manure alone; and on a further portion farmyard by itself. They stand as above in the order of their usefulness. The Virginian variety of Tobacco was that

FIG. 57.—GRAFTING THE MANGO. (SEE P. 372.)

and I consider Snowflake, *alias* Pride of America, and Beauty of Hebron, the two best varieties the Americans have sent us up to the present time. Were I bound to grow but one variety of Potato I should have no hesitation in plumping for Beauty of Hebron, having always found it a heavy cropper, and of good quality on most kinds of soils. *J. W. Sedgley, Rose Hill, Worcester.*

— I am surprised to hear that this variety has been in cultivation for so long a time, having thought it was of more recent introduction, as it was well exhibited at the first International Potato Show in 1875, and it was placed fourth in the class for single dishes, thirty-three competing. This was a class that, in the opinion of the *Gardeners' Chronicle* reporter, was badly judged, or the variety might have held a higher position. It is, as Mr. Murphy says, a fine variety, and I suppose it, like many more good things, has got elbowed out by novelties. *G. Potts, Jun.*

CHRYSANTHEMUMS ON WALLS FOR CUTTING.—Your correspondent, "J. Horsefield, Heytesbury," does good service to specially draw attention (p. 303), to the advisability of planting these plants just now. I am unusually favoured by having a warm south wall, so my plants have been out for a fortnight, to

annuals will change to evergreen perennials in another when there are more nutritive (?) surroundings." A list of these also would be interesting to some of us, I am sure. The terms annual and perennial, deciduous and evergreen should be strictly defined in a discussion upon evergreens, and it seems that the author in this case has not a clear idea. This is an interesting subject, but a paper upon it which generalises only is worthless. "Such plants as Rhododendrons—such plants as *Hellebores*" embraces too wide a view when in both genera there are deciduous as well as evergreen species. Japan may be a land of evergreens, but it is not singularly so; Australia, New Zealand, Chili, California furnish our gardens most with hardy and tender evergreens. *W. G.*

SCENT IN SOLOMON'S SEAL.—Thanks to the courtesy of some of your correspondents I no longer deny that there is a scented strain of this fine old plant. But I am by no means prepared to go the length of "S." p. 277, in broadly intimating that the common Solomon's Seal has a rich fragrance, unless he means that the odour becomes so small by degrees and beautifully less, as to be mostly imperceptible to ordinary mortals. Such, however, is by no means the case with the scented variety,

experimented with. The result in crop was exceedingly satisfactory, the weight of the green crop being estimated at between 5 and 6 tons. Some of the leaves measured 40 inches by 15 across. It is necessary to add that in drying the crop loses about 75 per cent. of its green weight. Mr. Barron had some of the leaf manufactured, which is said to be of fair average quality, and, speaking from experience, of the flavour of Turkish; but manufacturers find it in the meantime more profitable and convenient to use the foreign article; and as the Excise looks with suspicion on the home-growth of the plant, there are considerable bothers attendant. The experiment may be said to have been thoroughly successful in showing that good useful Tobacco can be grown at home, and it only requires that a taste be created for it, and the growth encouraged by some consideration of the duty. *W. Kelly.*

ACACIA ARMATA.—A fine specimen of this well-known plant may now be seen at the Public Park, Preston. The plant has been under the care of Mr. G. Rowbotham for many years, and it already begins to assume the dimensions of a tree. It is over 10 feet in height, 8 feet in diameter, the stem at its base being 15 inches in circumference. In every

respect it is a well-grown plant, since many of the lower shoots are but very little raised above the tub in which it is planted. H. S.

SOCIETIES.

ROYAL BOTANIC.

The first spring show of the Society was held on Wednesday, the 21st inst., at the gardens in Regent's Park, when the conditions of the weather were more propitious than they had been for several days previously.

Bulbous Plants.—These were, of course, the most conspicuous features of the show, and were of very good quality throughout. Hyacinths were well represented. Mr. J. Douglas, Great Gearies Gardens, Hford, E., showed best in the amateur's division, his Lord Derby, King of the Blues, La Grandesse, Princess Amelia, Vuurbaak were noticeable. Mr. H. Eason, gr. to B. Noakes, Esq., Hope Cottage, Highgate, N., followed, also showing well.

In the nurserymen's division the leading position was taken by the exhibit of Messrs. H. Williams & Sons, Fortis Green, Finchley, showing vigorous dease spikes; 2nd, Mr. H. R. Wright, Lee, Kent. This order was reversed in the class for twelve pots of Tulips; but the finest specimens of Tulips came from Mr. J. Douglas, he taking 1st in the amateur's division, followed by Mr. R. Scott, gr. to Miss Foster, The Holme, Regent's Park. Mr. Douglas led again with twelve Amaryllis, showing strong plants bearing large bright flowers, Red Gauntlet and Vesuvius being fine samples. Messrs. Paul & Son, Cheshunt, were a close 2nd. Mr. H. R. Wright, and Messrs. H. Williams & Sons were respectively 1st and 2nd for twelve pots of Narcissus, both showing excellent examples with large flowers; the best varieties were Laura, Her Majesty, and Gloriosa. Crocuses in pots, very well flowered, were best from Mr. R. Scott; Mr. J. Douglas 2nd. Messrs. H. Williams & Sons were 1st for Lilies of the Valley, showing strong specimens not fully flowered; 2nd, Mr. J. R. Chard, Brunswick Nursery, Stoke Newington, with smaller plants. Messrs. Paul & Sons, Cheshunt, received 1st for twelve bulbous plants not included in the foregoing classes. Iris reticulata, l. r. Krelagei, Scilla sibirica, Bulbocodium vernum, Galanthus Sbarlockii, and Leucojum carpathicum were well shown.

Various.—Dentizas, from Mr. J. Douglas, were, as usual, 1st; Mr. Eason and Mr. R. Bulter, gr. to H. H. Gibbs, Esq., St. Dunstons, Regent's Park, were 2nd and 3rd, all showing well.

Mr. J. May, Gordon Nursery, Twickenham, and Mr. J. Odell, Gould's Green, Hillingdon, were 1st and 2nd for Cyclamens (open); and in the amateur's division Mr. D. Phillips, gr. at Langley Broom, Slough, was 1st—good specimens being shown in all cases.

Chinese Primulas were in very good form from Messrs. H. Williams & Sons, and also from Mr. W. Kemp, gr. to H. Barry, Esq., Bushill House, Winchmore Hill, who took 2nd.

Mr. Douglas showed the best collection of hardy Primulas grown under glass. *P. viscosa nivalis* was very well represented, and also *P. marginata*, *P. rosea*, and various others. Mr. C. J. Clements, gr. to L. H. Hicks, Esq., Springfield House, Muswell Hill, was 2nd; *P. verticillata*, *P. obconica*, *P. denticulata*, and *P. rosea*, were prominent.

Greenhouse Azaleas were well shown by the amateurs, Mr. Eason leading well with examples of Mrs. Turner, Jean Vervaene, Apollon, &c.; 2nd, Mr. R. Scott, having smaller plants. Nurserymen made a poor display.

Messrs. Paul & Sons were the only exhibitors of Roses, showing Souvenir d'un Ami, Innocente Pirola, Catherine Soupert, and Avocat Duvier, in good form.

Miscellaneous Exhibits.—Messrs. Paul & Sons showed a good collection of Roses, receiving a Large Bronze Medal; W. A. Richardson, Celine Forestier, Lady Alice, Dr. Andry, &c., were all well shown. Ghent Azaleas were sent from Messrs. H. Lane & Sons, Berkhamsted, to whom a Large Bronze Medal was awarded.

Groups of Narcissi, &c., came from Messrs. Barr & Son and from Mr. T. S. Ware, the latter showing a quantity of *N. poeticus ornatus*.

Hyacinths were sent by Messrs. W. Cutbush & Sons, which, with other plants, were tastefully arranged in a bank of moss. Messrs. J. Veitch & Sons also sent a large collection of Hyacinths, showing large sturdy spikes. Large Bronze Medal.

Mr. B. S. Williams, Upper Holloway, N., contributed a large and varied group of bulbous plants, of excellent quality, showing almost 200 spikes of Hyacinths; also Narcissi, Tulips, Amaryllis, &c. Large Silver Medal.

A somewhat similar but smaller collection came from Messrs. H. Williams & Sons, who were awarded a similar Medal.

Messrs. Paul & Son staged an interesting collection of hardy plants, including *Negases Stracheyi*, *Saxifraga Burseriana*, *S. Frederici Augusti*, *S. sancta*, *Ranunculus anemonioides*, *Erica herbacea*, &c.

Cinerarias of great vigour, depth of colour, and of large size, came from Mr. James, Woodside, Farnham Royal, Slough. Large Bronze Medal.

Mr. J. Odell, Hillingdon, sent Cyclamen.

CERTIFICATES: BOTANICAL.

Fritillaria Thomsoniana (J. Veitch & Sons)—flowers pale blush colour, about twenty are borne on a scape 18 inches long.

Trillium discolor var. *atrata* (J. Veitch & Sons)—flowers dark brown, leaves dark brownish-green with splashes of greyish-green.

Saxifraga Frederici Augusti (see Royal Horticultural Society's report March 17 last).

Dendrobium nobile Cooksoni (H. Perkins, gr. to Right Hon. W. H. Smith, M.P., Greenlands, Henley-on-Thames)—lateral petals modified so as to resemble the lip.

FLORAL.

Rose Lady Alice (Paul & Son)—pale blush, full flower, H.P.

Cinerarias from Mr. J. James:—

Maria, white self, disc violet, rays regularly overlapping.

Favourite, brilliant magenta-red, white band round disc, which is violet.

Irene, purple-carmine, narrow white band round the dark violet disc.

NOTTS HORTICULTURAL AND BOTANICAL.

A MONTHLY meeting of this Society was held at the Mechanics' Institute, Nottingham, on the 14th inst., Mr. N. Pownall (Leaton Hall Gardens) in the chair. There were also present:—Messrs. S. Thacker, Attenborough, Braunstone, Baker, Kirk, Ralphs, Holmes, Edmunds, A. Page, E. Steward (Secretary), &c. A paper on the "Hyacinth" was read by Mr. Steward, who hoped that it would be the means of opening up a discussion on what, in his humble opinion was really the great question for all gardeners and horticulturists of the present day, namely, how to "crop" their land so that it will pay the occupier and the owner. He should endeavour to show them that money could be made by growing bulbs and other flowering roots as well as it was done in the famous district in Holland. Mr. Steward then traced the history of the Hyacinth from its introduction from Greece in the year 1594. Since then Dutch growers had taken up the growth of this flower, the soil and situation of this district in Holland being particularly favourable for their development. The district in question was 1487 acres in extent, and it was estimated that the imports of bulbs to England annually reached £50,000, the bulb trade being a very extensive one. Few were aware of the amount expended in Hyacinths, bulbs, &c. The London parks required many thousands. Considering the present bad times their agricultural friends were passing through, he would suggest to them the advisability of turning their attention to the growing of bulbs, as he believed he had every variety of soil and climate suitable to their growth in the adjoining county of Lincoln. In fact, he knew of several growers in the neighbourhood of Spalding who raised many thousands of bulbs of various sorts for the trade in London and elsewhere, and he saw no reason why so much money should be sent into Holland, Germany, and other places for roots which could be grown as well, and in many cases superior, in our own country. Not long since he was shown a heap of Snowdrops in one end of a barn near Peterborough, which consisted of about 250,000 roots. This heap was the result of about 2 acres' growth, and had yielded a handsome profit to the owner by the flowers which had been gathered early in the spring, and yet that heap of roots was worth £180. If that was not a paying crop, he should like to know what was. Another item which he desired to mention was the growth of the Lily of the Valley crowns.

At the present time we imported something like 50,000,000 of this particular variety from Germany and Holland at a cost of £25,000 per annum. All this money might just as well be saved and kept in our own country. Many thousands grown in Lincolnshire had been tried, and they had proved better in every respect than those grown abroad. He had had some of the finest *Gladiolus* bulbs he had ever seen grown on poor sand land near the Forest. He might also mention in support of what could be done in England that there were a hundred acres of ground in Cornwall planted with Narcissus, and nearly the whole of the Scilly Islands were planted with the same flowers of various kinds for the supply of cut flowers for the London and midland markets. These flowers found a ready sale, and were extensively used for home and other decorations. They were without doubt one of the most useful of all cut flowers on account of the long time they lasted after being cut. A discussion followed.

LINNEAN.

MARCH 15.—W. Carruthers, F.R.S., President, in the chair. Mr. J. E. Harting exhibited the frontal portion of the skull of a red-deer stag, which, although an adult animal, had never possessed horns, and made some remarks on the occasional occurrence of this abnormality. The stag in question was one which had been shot some years ago by the late Emperor of Germany in the royal forest of Goerde, in Jlaaover. A discussion followed, in which the President, Mr. Seeborn, and Dr. Hamilton took part. The first paper of the evening was then read by Mr. George Masee, entitled, "A Monograph of the Thelophorea," and drawings of several of these fungi were exhibited. A paper by Mr. E. A. Batters, describing three new marine Alga, was then read by the Botanical Secretary, Mr. B. Daydon Jackson, who exhibited the drawings made to illustrate the paper. After some remarks from the President Mr. Harting pointed out the indirect influence of the Gulf Stream in causing a deposition of northern sea-weeds upon the north-east portion of the English coast, where some of the species described had been found. The meeting then adjourned to April 5.

LAW NOTES.

EDINBURGH.

THE First Division of the Court of Session gave judgment on Friday last, in a reclaiming note in an action by William Smith & Son, seed merchants, Aberdeen, against Waite, Nash & Co., seed merchants, 70, Southwark Street, London, for £2500, for alleged breach of contract in connection with the supply of 100 bushels of Old Meldrum Green-top Yellow Turnips. The pursuers resold the seed in various quantities to merchants in Aberdeenshire, and they stated that it proved to be a mixture consisting of from one-half to two-thirds of seed of the Old Meldrum Green-top Yellow Turnip and of seed of an entirely different kind—a Tankard species. On the nature of the seed becoming apparent from the crop, claims of damages were intimated by the purchasers against the merchants who had supplied it, and the merchants, in turn, intimated claims against the pursuers. The pursuers had paid in such claims £172 5s. 8d., and there were other claims unsettled. The defenders pleaded that they gave no warranty for the seed. The Lord Ordinary (McLaren) awarded the pursuers £600 and expenses. The defenders then reclaimed.

Lord Adam, who gave the leading opinion, said that under their terms of sale the defenders "gave no warranty, expressed or implied, as to description, quality, productiveness, or any other matter, of any seeds they sent out, and they would not be in any way responsible for the crop. If the purchaser did not accept the goods on these terms, they were at once to be returned." It was proved that the pursuers knew of these conditions, and if the defenders could get customers to deal with them on such conditions—which he should scarcely have expected—he saw nothing illegal in them. The question, however, was whether the loss which had arisen was to fall upon the pursuers or the defenders. The seed

was accepted by the pursuers on the condition that the defenders did not warrant it, even though of the description ordered. He thought accordingly that the case which had occurred was just a case which the terms of sale were intended to meet, and against which the defenders desired to protect themselves, and he thought they had done so successfully. He could not follow the reasoning of the Lord Ordinary by which he arrived at an opposite result. Being of opinion that the defenders were not liable, it was unnecessary to consider the question of damages.

Lord Kiinner said he thought the whole argument for the pursuers might be summed up in a sentence. The defenders did not perform their contract because they had delivered Turnip seed of a different description from that for which the pursuers bargained. That would be quite an unanswerable ground of action were it not for the stipulation, which, he agreed with Lord Adam, was designed to meet that case.

The Lord President said that he was of the same opinion. If it had not been for the conditions expressed in what were called the terms of sale, the case would have been very clear in favour of the pursuers, because to a certain extent the defenders delivered a different article from that which was sold.

Their Lordships accordingly recalled the Lord Ordinary's interlocutor, and gave expenses to the defenders.

We understand there is every probability of this decision being appealed against. *North British Agriculturist.*

THE WEATHER.

THE PAST WEEK.

The following summary record of the weather for the week ending, March 19, is furnished from the Meteorological Office:—

"The weather has been fairer than of late over the greater part of Scotland, but over England and at most of the Irish stations the conditions have been very changeable and unsettled, with frequent falls of snow and sleet. In all the more eastern and south-eastern parts of England the falls of snow were very considerable.

"The temperature has been below the mean in all districts, the deficit ranging from 5° in the 'Channel Islands,' and 6° in 'Ireland, S.' to as much as 8° or 9° over the northern parts of England, and the east and west of Scotland. The highest of the maxima, which were registered during the earlier days of the period over England, and towards its close in Ireland and Scotland, ranged from 42° over the north of England to 53° in 'England, E.,' 'Ireland, S.,' and the 'Channel Island.' On some days the maximum readings in many parts of Great Britain were very little above the freezing point. The lowest of the minima, which were recorded on irregular dates, were lower in Scotland than elsewhere. At Braemar the thermometer on the 17th fell to 2°, at Fort Augustus to 12°, and at Glendale to 19°; while in Ireland the minima varied between 21° and 22°, and over England between 23° and 26°.

"The rainfall has been less than the mean in Ireland and Scotland, but rather more over the greater part of England.

"Bright sunshine shows a decided increase in Scotland, as well as in the south-west of England and over Ireland, but a general decrease elsewhere. The percentage of the possible amount of duration ranged from 10 to 16 over the greater part of England to 34 in 'Ireland, S.,' 42 in 'England, S.W.,' and 46 in 'Scotland, N.' In the 'Channel Islands' only 17 per cent. was recorded."

MEAN TEMPERATURE OBSERVED AT CHISWICK DURING THE WEEK ENDING MARCH 31. (AVERAGE OF FORTY-FOUR YEARS).

Mar. 25	41°.1	Mar. 29	44°.
" 26	41°.	" 30	44°.
" 27	41°.	" 31	45°.
" 28	41°.	Mean for the week	44°.

[Accumulated temperature indicates the combined amount and duration of the excess or defect of temperature above or below 32° F. for the period named, and is expressed in Day-degree—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

NOTICES TO CORRESPONDENTS.

* * * GOOD FRIDAY.—We beg to remind our correspondents that it will be necessary to send their communications so as to reach us not later than Tuesday evening next, as in consequence of Friday, we go to press one day earlier than usual.

CINERARIAS: *H. Cannell & Sons.* The flowers in size and form are as good as any we have seen. The crimson shades are very rich, and the white flower is quite pure.

CURRENT-BUD MITE: *A. F.* Read your *Chronicle*. It has been figured and described repeatedly. See February 4 this year, p. 151.

EICORONIA AZUREA: *John Zazovorka.* We do not think the plant is in commerce, but it can probably be obtained from a botanic garden. Kew and Oxford have the plant.

EUCHARIS: *G. C.* All three samples were attacked with the mite, and with a fungus also.

FLOWERS OF PASSIFLORA PRINCEPS RACEMOSA FAILING OFF: *W. R.* The night temperature is too high by 10°; 60° at night is sufficient; anything higher than that, together with want of air, would have a weakening effect, with our clouded winter sky. Examine the soil at the roots: it may be too dry, or the contrary.

GROWTH OF ALGÆ IN A WATER-TANK: *E. J. B.* Put a cover over the tank, so that all light is shut out.

INSECTS: *J. B. T.* The insect which has attacked your young Cucumber plants is one of the plant bugs, Cimex (Phytocoris) Chenopodii. Its habits are similar to those of the aphids, and it may, in like manner, be destroyed by careful fumigation.—*F. S. M.* The Orchis leaf sent is covered with minute dark-coloured spots of various sizes, and occasionally confluent, but we found no insects, nor do the spots show any trace of having been sucked by aleyrodes or other insects. We found on the leaf two or three very minute particles of semitransparent scale, or wax-like secretion, which exhibited under high power small, circular, irregularly placed spaces, connected by oval or oblong ones with thickened edges, but which we cannot refer to any insect structure. *I. O. W.*

MELONS: *W. M. B.* Paradise Gem (B. S. Williams'), and Improved Victory of Bath (Gilbert's), are two excellent early varieties.

NAMES OF PLANTS: *E. H. 1.* Cephalotaxus sp.; 2, Abies nobilis; 3, A. pectinata; 4, Picea excelsa, Clanbrassil variety; 5, P. sitchensis; 6, Juniperus sinensis; 7, Quercus ilex.—*M. H. 1.* Brassica caudata, small Brazilian form.—*Y. G. C.* Freziera rhomboidea.—*Southampton.* Rhododendron dauricum, native of Siberia.—*J. F. P.* Cymbidium Lowianum; Oncidium Cavendishii.—*Eriantha.* 1, Dendrobium Pierardi; 2, Maranta picta; 3, Carex riparia variegata; 4, specimen not sufficient; 5, Ficus repens.—*A Subscriber.* Orchid: Cologne cristata. Ferns: 1, Pteris tremula; 2, Aspidium decompositum; 3, Davallia canariensis (probably—send fertile frond); 4, Polypodium quercifolium; 5, Asplenium bulbiferum; 6, Onychium lacidum; 7, Adiantum Capillus-veneris; 8, Aspidium falcatum.—*An Inquirer.* Adiantum concinnum-latum.—*G. M. R. 1.* Streptocarpus Rexii; 2, Polygala Dalmasiana; 3, Sparmannia africana; 4, Eoanymus macrophyllus argenteus; 5, Blechnum occidentale; 6, Adiantum formosum.—*C. M. Owen.* Leontice leontopetalum; the Crocus we cannot name without complete materials.—*L. P. 8.* Acacia longissima; 9, Periploca græca; 10, Bryophyllum calycinum. The others next week.—*L. H. C. 1.* a Broom-rape or Orbanche, of which we will endeavour to find the name by next week; 2, a Composite, which we will try to discover; 3, Campanula speculum, Venus' Looking-glass; 4, Phyllylea angustifolia.

NEW ZEALAND: *C. H. H.* We cannot answer your questions, but advise you to apply to the Government Emigration Inquiry Office, 31, Broadway, Westminster. There is no horticultural journal published in New Zealand.

ONION GROUND: *P. R.* The "worms" are possibly the dreaded wireworm. The ground should be heavily dressed with soot and lime on being dug. Surface-dressings of soot and wood-ashes, made twice or thrice during the growing season, will encourage growth in the plants, and render the soil distasteful to the "worms."

POTATOS: *J. M.* We cannot name these from one small specimen of each variety.

WISTARIA SINENSIS: *G. M. R.*—Propagate by layering two or three year old shoots at full length in large pots, or in some sandy soil at the foot of the wall. When well rooted (in two years) detach and remove to another site.

COMMUNICATIONS RECEIVED.—*A. E. S.*—Baldwin's, *J. G. R.*—*F. Maier.*—*Ch. de Garlache.*—*W. H. Williams.*—*C. R. W.*—*J. H. G.*—*A. M.*—*J. G.*—*J. M.*—*J. E. B.*—*D. T. V.*—*T. S.*—*E. C. Buck.*—*W. D.*—*W. B.*—*Fomona.*—*H. W. W.*—*J. H.*—*Caledonian.*—*Col. Jones.*—*W. G.*—*R. A. R.*—*F. S.*—*A. H. K.*—*A. L. P.* (next week).—*Mayflower.*—*A. McE.*—*H. G. R. F.*—*Johnston.*—*S. T. N.*—*H. J. Ross.*—*Florence.*—*F. W. B.*—*Dublin.*—*G. J. N.*—*H. Corevon.*—*Geneva.*—*Tuffen West.*—*Count de R. E. P.*—*H. P. D.*—*C. H.*—*Copenhagen.*—*J. H. B.*—*Mentone.*—*C. S.*—*Brookline.*—*N. S. A.*—*G. S. B.*—*W. S.*—*Marburg.*

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

MARKETS.

COVENT GARDEN, March 22.

No alteration. Market will be very quiet for a fortnight. James Webber, Wholesale Apple Market.

FRUIT.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Fruit name, s. d. s. d., Fruit name, s. d. s. d. Includes Apples, Grapes, Keat Cobs, Lemons, Pears, Pine-apples, St. Michael, Strawberries.

VEGETABLES.—AVERAGE RETAIL PRICES.

Table with 4 columns: Vegetable name, s. d. s. d., Vegetable name, s. d. s. d. Includes Artichokes, Beans, Beet, Bruss. Sprouts, Carrots, Cauliflowers, Celery, Cucumbers, Endive, Green Mint, Herbs, Leeks, Lettuce, Mushrooms, Mustard and Cress, Parsley, Potatoes, Rhubarb, Seakale, Shallots, Spinach, Spruce, Tomatoes, Turnips.

POTATOS.—Markets about the same as last week. Hebron finished.

PLANTS IN POTS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Plant name, s. d. s. d., Plant name, s. d. s. d. Includes Aralia Sieboldi, Azaleas, Bouvardias, Cinerarias, Cyclamens, Cyperus, Daffodils, Deutzias, Dracena terminalis, Euonymus, etc.

CUT FLOWERS.—AVERAGE WHOLESALE PRICES.

Table with 4 columns: Flower name, s. d. s. d., Flower name, s. d. s. d. Includes Acacia, Anemone, Arum Lilies, Azaleas, Bouvardias, Camellias, Carnations, Cinerarias, Cyclamens, Daffodils, Deutzia, Eucharis, Gardenias, Heliotropes, Hyacinths, Lilium longiflorum, Lily of Valley.

* * * Orchid bloom in great variety, but the demand not very good.

SEEDS.

LONDON: March 21.—Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., write that, as might be expected, the prolonged winter has diminished for the moment the demand for farm seeds; meantime, as previously noted, stocks all round are in moderate compass, and prices stand at a remarkably low level. With favourable weather, an active sowing demand would set in; thus the conditions seem ripe for some rally in values. No variety this week exhibits any important quotable variation. From abroad offerings now come to hand less freely, whilst for Alsike and white Clover rates are harder. Spring Tares realise former terms. Hemp seed is still scarce. Canary seed slow. Peas unaltered.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended March 17:—Wheat, 30s. 6d.; Barley, 30s. 3d.; Oats, 15s. 8d. For the corresponding week in 1887:—Wheat, 32s. 11d.; Barley, 24s. 4d.; Oats, 16s. 4d.

FRUIT AND VEGETABLES.

SPITALFIELDS AND COLUMBIA: March 21.—Supplies of all kinds of green stuffs have been smaller, owing to the severe weather. Demand moderate, at advanced prices. Quotations:—Cauliflowers, 6s. to 10s. per tally; Savoys, 5s. to 7s. 6d. do.; Brussels Sprouts, 4s. 6d. to 7s. per bushel; Broccoli, 3s. to 4s. 6d. do.; Spinach, 2s. to 2s. 6d. per sieve; Turnip-tops, 3s. to 4s. per sack; Greens, 5s. to 8s. per dozen bunches; Turnips, 2s. 6d. to 3s. 6d. do.; Carrots, 2s. 6d. to 2s. 9d. do.; English Onions, 13s. to 14s. 6d. per cwt.; foreign do., 10s. to 12s. per bag of 110 lb.; Carly, Kale, 2s. 6d. to 3s. 6d. per bushel; Seakale, 1s. 6d. per punnet; Horseradish, 1s. to 1s. 6d. per bundle; Celery 8d. to 1s. do.; forced Rhubarb, 2s. to 3s. 6d. per dozen bundles; natural do., 3s. to 4s. 6d. do.; Cabbage Lettuces, 8d. to 1s. 6d. per dozen; Endive, 2s. to 2s. 6d. do.; Leeks, 2s. to 2s. 6d. do.; Beetroots, 8d. to 1s. do.; Parsnips, 9d. to 1s. 6d. per score; English Apples, 4s. to 7s. per bushel; American Apples, 14s. to 22s. per barrel; Carrots, 30s. to 40s. per ton; Mangel, 20s. to 22s. do.

STRATFORD: March 20.—Quotations:—Cabbages, 8s. to 10s. per tally; Greens, 1s. to 1s. 6d. per cwt.; Turnips, 2s. 6d. to 3s. 6d. per dozen bunches; ditto, 40s. to 60s. per ton; Carrots, household, 40s. to 60s. do.; do., cattle feeding, 26s. to 34s. do.; Parsnips, 6d. to 9d. per score; Mangels, 20s. to 22s. per ton; Swedes, 20s. to 22s. do.; Onions, English, 13s. to 15s. per qr. do., Hungarian, 12s. to 14s. per bag; Apples, American, 18s. to 25s. per barrel; Watercress, 6d. per dozen; Carrots, 3s. to 3s. 6d. per dozen bunches; Radishes, 10d. to 1s. 2d. do.; Parsley, 3d. to 6d. per bunch; Beetroots, 8d. to 1s. per dozen; Leeks, 3s. to 3s. 6d. per dozen bunches; Celery, 9d. to 1s. per bunch; Rhubarb, 2s. to 3s. 9d. per dozen bunches.

POTATOS.

BODFORD AND SPITALFIELDS: March 20.—The weather has shortened supply on the markets, and prices are rather firmer, though demand is slow. Quotations:—Regents, 50s. to 100s.; Magnum Bonums, 50s. to 100s.; Champions, 45s. to 70s.; Dutch Rocks, 50s. per ton.

SPITALFIELDS AND COLUMBIA: March 21.—Quotations:—Magnum Bonums, 45s. to 70s.; Regents, 65s. to 90s.; Victorias, 50s. to 65s.; Champions, 50s. to 60s.; Beauty of Hebron, 120s. to 140s. per ton.

STRATFORD: March 20.—Quotations:—Scotch Magnums, 75s. to 90s.; English do., 55s. to 80s.; Fenland, 45s. to 55s. per ton.

Imports.—The imports into London last week consisted of 841 bags from Hamburg and 13 from Harlingen.

HAY.

Averages.—The following are the averages of the prices obtained at the various metropolitan markets during the past week:—Clover, prime, 81s. to 97s. 6d.; inferior, 70s. to 82s.; hay, prime, 75s. to 95s.; inferior, 50s. to 70s.; and straw, 30s. to 42s. per load.

PARIS "HALLES CENTRALES," MARCH 21.

LEGUMES.

Table with 3 columns: Legume name, Price per 100 kil., Price per 100 kil. Includes Ail, Persil, Haricots verts, Pommes de terre, etc.

FLEURS.

Table with 3 columns: Flower name, Price per bouquet, Price per bouquet of 12 fleurs. Includes Violettes, Narcisses, etc.

PLANT NOW EVERGREENS, CONIFERS, and other suitable Plants for ORNAMENTAL EFFECT.

CLIMBERS & DECORATIVE PLANTS Hardily Grown.

SANKEY AND SON'S GARDEN POTS.

From Messrs. FISHER, SON & SIBRAY, Handsworth Nurseries, Sheffield.

"DEAR SIRs,—We have pleasure in testifying that after having used your pots for the past twenty-five years we have found them all that could be desired."

From Mr. JOHN FORBES, Buccleuch Nurseries, Hawick, N.B.

"GENTLEMEN,—I have much pleasure in testifying to the unqualified satisfaction your pots have given me. The quality is all I could desire, and promptitude of dispatch wonderful."

"BULWELL POTTERIES," NOTTINGHAM.

Carriage and Breakage Free on £10 Orders. Half Carriage and Breakage Free on £5 Orders. Samples (carriage free) gratis, prices free on application.

From Messrs. WOOD & INGRAM, Huntingdon Nurseries.

"DEAR SIRs,—Having dealt with you for over a quarter of a century, we have much pleasure in giving our experience of your pots. In our opinion they are everything that can be wished for, being light and strong, of first-class colour, shape, and finish. The special deep pot you make for our Clematis, from our own design, gives unqualified satisfaction to ourselves and all our customers. We want 25,000 for our first batch, and rely on your usual prompt and careful attention."

NEW EDITION, CORRECTED UP TO DATE.

 Apply to **D. WAKELIN**, Alford, Lincolnshire.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used **STANDEN'S MANURE** for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—
C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in **TINS**, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in **KEGS**, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

CHUBB, ROUND & CO., WEST FERRY ROAD, MILWALL, LONDON, E.

To Market Gardeners, &c.
 To Grow fine Vegetables and Flowers, Gardeners should use **SULPHATE OF AMMONIA**. One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to **THE MANAGER**, Sheffield Gas Company, Sheffield.

R. HALLIDAY & CO.,

HOTHOUSE BUILDERS and HOT-WATER ENGINEERS,

ROYAL HORTICULTURAL WORKS, MIDDLETON, MANCHESTER.

Vinerias, Stoves, Greenhouses, Peach Houses, Forcing Houses, &c., constructed on our improved plan, are the perfection of growing houses, and for practical utility, economy, and durability cannot be equalled. We only do one class of work, and that THE VERY BEST.

Conservatories and Winter Gardens designed architecturally correct without the assistance of any one out of our firm, from the smallest to the largest. Hot-water Heating Apparatus, with really reliable Boilers, erected, and success guaranteed in all cases. Melon Frames, Sashes, Hotbed Boxes, &c. always in stock.

Plans, Estimates and Catalogues free. Customers waited on in any part of the Kingdom.

Our Maxim is and always has been—

MODERATE CHARGES. FIRST-CLASS WORK. THE BEST MATERIALS.

MESSENGER & CO.'S New CATALOGUE of Greenhouses and Heating Apparatus,

Just issued, will be found the most complete, practical, and reliable guide to all about to build, alter, or heat greenhouses. Illustrations of every description of Glass-house, from the largest range of Winter Gardens to the simplest forms of Portable Greenhouses, Plant Protectors, and Garden Frames; also of all the best kind of Boilers, Hot-water Pipes, and all appliances for heating. This Catalogue, possessing hundreds of illustrations of all the latest improvements in greenhouse building and heating, is on a scale never before attempted. It should be in the hands of every one interested in gardening, as it contains many practical hints on the subjects of which it treats, the result of many years' experience. **Price 2s. post-free.**

A large number of the illustrations are taken from greenhouses erected by us in various parts of the country, an inspection of this Catalogue shows, therefore, the efficiency of which has been well tested by actual use. The advantages possessed by us enable us to carry out work with the utmost promptness, and in the very best style, at prices which defy competition. Surveys made and gentlemen waited on in any part of the country. Plans and Estimates free on application.

"PURE and ELOQUENT BLOOD."

"... her pure and eloquent blood Spoke in her cheeks, and so distinctly wrought. That one might almost say her body thought."

DR. ROBERTS'S ALTERNATIVE PILLS (Reg'd Title.)

Have for more than ONE HUNDRED years PURIFIED THE BLOOD of all who have taken them, and RESTORED SUCH TO HEALTH. Indeed, in all kinds of SKIN AFFECTIONS (which arise from impurity of the blood) they are invaluable.

IN HIS WELL-KNOWN cure of SKIN DISEASES Dr. Roberts always prescribed a two-fold treatment—his ALTERNATIVE PILLS (every box bears the above engraving on label), to change the state of the blood, and render it pure; and

DR. ROBERTS'S POOR MAN'S FRIEND (Reg'd Title.)

as an OINTMENT to relieve Itching and to HEAL THE SURFACE.

Ask your Chemist for Dr. Roberts's ALTERNATIVE PILLS, 1s. 1½d., 2s. 9d., 4s. 6d., 11s. and 22s. per box; and for Dr. Roberts's POOR MAN'S FRIEND (Ointment of many virtues), 1s. 1½d., 2s. 9d., 11s. and 22s. per pot, and see our name, BEACH & BARNICOTT (Successors to Dr. Roberts), BRIDPORT, on each, as without it none are genuine.

IN THE EVENT of ANY DIFFICULTY in OBTAINING THEM, either, or both, will be sent, post-free, on receipt of value, by BEACH & BARNICOTT, BRIDPORT, who INVOKE UNIVERSAL APPLICATION for their Descriptive Circulars, in regard to other Specialities of the well-known Dr. Roberts for the practical cure of difficult diseases, which will be sent to any address, post-free. Every one affected cannot but read them with profit.

In writing please name this Paper.

THE BEST REMEDY FOR INDIGESTION.

CAMOMILE PILLS.

Are confidently recommended as a simple but certain remedy for

INDIGESTION

See Testimonial, selected from hundreds:—
CROYDON, 1885.

"Having been a sufferer from Indigestion for many years, I am happy to say that I have at last not only been relieved but perfectly cured by using Norton's Pills, and confidently recommend them to all suffering from the same."
"J. WILKINSON."

For other Testimonials, see Monthly Magazines.

Books on Gardening.
HANDY BOOK of the FLOWER-GARDEN;
being Practical directions for the Propagation, Culture, and Arrangement of Plants in Flower Gardens all the year round. With Engraved Plans. By DAVID THOMSON, Gardener to His Grace the Duke of Buccleuch, K.G., at Drumhaurig, Forth and Cheaper Edition, crown 8vo, 5s.
"Its author is entitled to great praise for the simple and clear manner in which he has explained the cultural directions, which, if carefully complied with, will enable the non-professional floriculturist to grow plants as well as any gardener."—*Gardeners' Chronicle.*

HANDY BOOK of FRUIT CULTURE UNDER GLASS. By the SAME. New Edition, Revised and Enlarged, with Engravings. Crown 8vo, 7s. 6d.
"No work of the kind of which we have any knowledge is at all to be compared with this. It is the result of ripe experience, close thought, and ample acquaintance with the subject in all its parts. His book is one that ought to be in the hands of every gardener, of every amateur fruit grower, and, indeed, of everyone who desires to know the best that can be known on the subject."—*Scotsman.*

A BOOK ABOUT ROSES: How to Grow and Show Them. By the Rev. Canon HOLE. Tenth and Cheaper Edition, Revised, fcap. 8vo, 3s. 6d.
"His work may now be considered the most complete guide to this interesting branch of floricultural art."—*Saturday Review.*

"At once charming and instructive.....The practical questions of position, soil, manure, and selection are carefully and exhaustively treated."—*Standard.*

CULTIVATED PLANTS: their Propagation and Improvement. By F. W. BURIDGE, Author of "The Narcissus; its History and Culture, &c."—With Engravings, and Index. Crown 8vo, 12s. 6d.
"It is for scientific professionals and amateurs that Mr. Buridge has produced this extremely complete and valuable manual upon the propagation and improvement of plants."—*Standard.*

DOMESTIC FLORICULTURE, WINDOW-GARDENING, and FLORAL DECORATIONS. Being Directions for the Propagation, Culture, and Arrangement of Plants and Flowers as Domestic Ornaments. By the SAME. Crown 8vo. Illustrated. Revised Edition, Enlarged, 7s. 6d.
"A charmingly illustrated *revised-mecum* on Window-Gardening, Floral Decorations, and the whole field of adaption of floral science to domestic ornament."—*Academy.*

HANDBOOK of HARDY HERBACEOUS and ALPINE FLOWERS, for GENERAL GARDEN DECORATION. Containing Descriptions, in Plain Language, of upwards of 1000 Species. By WILLIAM SUTHERLAND, Gardener to the Earl of Minto; formerly Manager of the Herbaric Department at Kew. Crown 8vo, 7s. 6d.

WILLIAM BLACKWOOD AND SONS, Edinburgh and London.

Estate Sales.

WANTED, a good LAWN HAND; must understand Mowers. Character for sobriety and ability required. Wages 21s.—Apply, personally or otherwise, to GARDENER, Avenue House, Finchley, N.

WANTED, a WOMAN, that thoroughly understands Poultry, &c., and to clean hoth.—H. OSMAN, Warren House Gardens, Great Stanmore, Middlesex.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

WANTED, A GARDENER!!!—Having had long experience and an extensive connection we are in a position to RECOMMEND MEN thoroughly capable of filling with credit any situation in the Gardening World. On receipt of full particulars we will recommend a suitable Man. Correspondence invited.—R. B. LAIRD and SONS, Successors to Downie & Laird, Seed Merchants, Edinburgh.

B. S. WILLIAMS begs to intimate that he has at present in the Nursery and upon his Register some excellent Men, competent either to fill the situation of HEAD GARDENER, BAILIFF, FOREMAN, or JOURNEYMAN. Ladies and Gentlemen requiring any of the above will please send full particulars, when the best selections for the different capacities will be made.—Holloway, N.

To Noblemen and Gentlemen requiring Land Agents, STEWARDS, BAILIFFS, or GARDENERS.

JAMES CARTER and CO. have at all times upon their Register reliable and competent MEN, several of whom are personally well known to Messrs. Carter. Enquiries should be made to 237 and 238, High Holborn, W.C.

Gardeners, Bailiffs, &c.

JOHN LAING and SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or Gardeners for first-rate establishments, or Single-handed situations, can be suited, and have full particulars by applying to us. No fees charged.—JOHN LAING and SONS, The Nurseries, Forest Hill, S.E.

RICHARD SMITH and CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

SCOTCH GARDENERS.

—JOHN DOWIE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of SCOTCH GARDENERS, waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

MANAGER or NURSERY FOREMAN.—Age 38, married; thoroughly experienced. First-class references, and having good connection could take journey.—S. A., 41, Wellington Street, Strand, W.C.

GARDENER (HEAD); married, no family.—The Countess of SELKIRK wishes to recommend George Ormiston, her late Gardener, who lived at St. Mary's Isle nearly seven years and left there only in consequence of the Earl of Selkirk's death. HOLLOWAY'S PILLS and OINTMENT.—Prevention of Weakness.—Whenever circumstances produce impure blood, lessen the force, or in any way disarrange the balance of circulation, stagnation takes place in the lungs, and consumption or other formidable symptoms discover themselves. Let Holloway's remedies be tried on the first feelings of debility, or on the first annoyance of a dry hacking cough. After the chest has been fomented with warm brine, and the skin has been dried with a towel, the Ointment should be well rubbed, twice a day, upon the chest and between the shoulders. The Pills should be taken in alterative doses to purify the blood and cleanse the system without weakening it, or rousing or aggravating urous irritation.

GREEN'S PATENT "SILENS MESSOR" AND OTHER LAWN-MOWING, ROLLING AND COLLECTING MACHINES FOR 1888.

The Winners of every First Prize in all cases of competition, and they are the only Mowers in constant use at all the Royal Gardens and at the Royal Horticultural Society's Gardens, South Kensington.

Patronised by—
HER MOST GRACIOUS MAJESTY THE QUEEN on many occasions,
HIS ROYAL HIGHNESS THE PRINCE OF WALES,
THE KING OF THE BELGIANS,
The Late EMPEROR OF THE FRENCH, The EMPEROR OF RUSSIA,
And most of the Nobility, Clergy, and Gentry of the United Kingdom.

Royal Horticultural Society's Show, South Kensington, London, June 3 to 7, 1881. The "Journal of Horticulture," of June 9, says:—"MOWING MACHINES.—After a critical examination the Silver Medal was granted to the old firm of world-wide fame, Messrs. T. GREEN & SON, of Leeds and London. As the Machines are known in all lands where good lawns are cherished, it is quite unnecessary to give any description of them."

Upwards of 140,000 of these Machines have been Sold since they were first introduced in the year 1856,

And thousands of unsolicited Testimonials have been received, testifying to their superiority over all others.

They have been submitted to numerous practical tests in Public Competition, and in all cases have carried off the Highest Prize that has been given.

The following are their Advantages over all others:—

- 1st. Simplicity of Construction—every part being easily accessible.
- 2nd. They are worked with much greater ease than any other.
- 3rd. They are the least liable to get out of order.
- 4th. They make little or no noise in working.
- 5th. They will cut either short or long Grass, wet or dry.

SILENS MESSOR MOWERS, with Improved Steel Chains and Handles.

S. SHEPPERSON,

FLORIST and SEEDSMAN,
PROSPECT HOUSE, BELPER,
DERBYSHIRE,

Pleas to inform the readers of this Paper that he is prepared to execute orders for the following plants, all of which are of the very finest possible strains that money can buy. They have all been grown on the Derbyshire Hills, and are therefore very hardy, and warranted to succeed and bloom well. All carriage free for cash with order.

DESCRIPTIVE LIST of Florist Flowers, Ad. stamps, or free to customers.

- PANSIES.**—A great specialty Five Silver Cups and other Prizes awarded during 1887, probably the best collection in England; the cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named, Show or Fancy, twelve for 3s., twenty-five for 5s. 6d., Carriage free for Postal Order.
- FANCY PANSIES.**—Un-named, six for 1s., twelve for 1s. 6d., twenty-five for 2s. 6d., Postal Order. All different and first-class sorts, free.
- CHRYSANTHEMUMS.**—Great special culture, the best and most distinct varieties only, of large-flowered, incurved, reflexed, early and late bloomers, pompons, Japanese, &c., including many grand new varieties by the best English, Continental, and American raisers. Twelve distinct varieties, named, well rooted plants, for 2s.; twenty-four for 3s. 6d., free.
- GRAND NEW CHRYSANTHEMUMS.**—The cream only of the new varieties of 1886 and 1887. Six for 2s., twelve for 3s. 6d., named distinct varieties.
- HOLLYHOCKS (Double).**—Charters' very finest and most select strain. Twelve varieties for 2s. 6d., six for 1s. 6d.; six extra strong for 2s., Postal Order, free.
- CANTERBURY BELLS.**—Grand new colours and new forms, double and single Telescope, Camellabrum, and other varieties. Twelve good plants, to bloom well, for 1s.; twelve extra strong for 1s. 6d., Postal Order, free.
- PURE SNOW-WHITE AURICULA.**—One of the most beautiful hardy spring flowering plants in cultivation. Two for 1s., free.
- AURICULAS.**—A really grand strain of this deliciously scented old-fashioned favourite flower, including Turner's Alpines, Dean's new laced varieties, Dew-berry's Giant, and other really fine sorts. Good plants, that will bloom well this spring, three for 1s., six for 1s. 9d., twelve for 3s., all free.
- POLYANTHUS.**—Finest strain grown, fine large trusses and blooms, and splendid colours. Cannot be surpassed. Twelve for 1s., twenty-six for 2s., 100 for 7s., free. All good blooming plants.
- POLYANTHUS and PRIMROSE.**—Jack-in-the-Green, Hose-in-hose, and other rare and curious forms unnamed. Six distinct sorts for 1s. 6d., twelve for 2s. 6d., free.
- THE NEW DOUBLE SCARLET GEUM.**—Quite hardy. Free bloomer. Grand for cutting or decoration. Twelve for 1s., twenty-five for 2s., Postal Order, free.
- CARNATIONS, PICOTEES, and CLOVES.**—Strong plants, from finest show flowers only, including many new sorts. Will give a mass of bloom. Twelve beautiful varieties for 2s. 6d., six for 1s. 6d., free.
- SCABIOSA (Double).**—A really fine hardy plant for garden decoration or cut flowers. Many fine colours. 1s. per dozen, free.
- PRIMULA CASHMIRIANA.**—Splendid hardy mauve-coloured spring flowering plant. Three for 1s., free.
- COLLECTION of twelve HARDY BORDER PLANTS,** distinct and useful for decoration and cutting purposes, for 2s., free.
- WALLFLOWERS.**—Double German, Cranford Beauty, Ware's dark red, and Kershaw's bright red. 1s. per dozen, free.
- FOXGLOVES.**—Gloxioia-flowered, Dean's grand new large spotted varieties, very fine, twelve for 1s. 6d., six for 1s., free.
- ALSO the FOLLOWING FREE-BLOOMING HARDY PLANTS:** should be in every garden; all at 1s. per dozen, free:—Pure white Thrift, fine edging and spring flower; Malva moschata alba and rosea, beautiful pure white and rose, blooms all summer; Sweet Williams, the finest dark and giant Auricula-eyed; Arabis alba, white spring-flowering plant, beautiful variegated foliage.

CATALOGUE Free on application.
RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

SEEDLING GLADIOLI.—Distribution of a celebrated collection, grown within 40 miles of Paris, by an amateur of 30 years standing. We have no hesitation in saying that this is an exceptional opportunity for securing an unusually fine and splendid race of varieties. Sold in mixture, 70s. per 1000, or 8s. 6d. per 100.

HOOPER AND CO. (Limited), Covent Garden, London, W.C.

PAUL AND SON, The "Old" Nurseries, Cheshunt, have still a fine stock of well-ripened Canees of extra quality. LIST on application.

A Good Potato, of Sterling Worth.
MAIN CROP KIDNEY,
W. W. JOHNSON AND SON.
First-class Certificate awarded by the Committee of the Royal Horticultural Society, September 21, 1887.

It was tested by cooking, and described by the Committee as a "White Kidney, with clean, rough skin, white flesh, a good cropper."

This Potato is pronounced by competent judges as likely to become one of the best Main Crop Potatoes of the future. It has entirely resisted disease; tubers have a handsome appearance, with very shallow eyes; are white, mealy, and of the finest flavour when cooked. In excellent condition for the table from the time of taking up until late in the spring.

Price per peck of 14 lb., 5s.; per bushel, 18s.

Wholesale of Messrs. HURST AND SON, 152, Houndsditch, London, E.; and from W. W. JOHNSON AND SON, Seed Potato Growers and Seed Merchants, Boston, Lincolnshire.

TREES and SHRUBS suitable for Towns and Smoky Districts. CATALOGUE Free on application.
RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

To the Trade
SEED POTATOS.
H. AND F. SHARPE will be pleased to make special offers of their carefully selected stocks of SEED POTATOS, raised on their own farms expressly for seed purposes. Seed Growing Establishment, Wisbech.

HARTLAND'S IRISH-CROWN DAFFODILS.

"The perfumed amber cup which, when March comes, gems the dry woods and windy wolds, and speaks the resurrection."

TRUE to the poetic idea of an ITALIAN CLIMATE. In Ireland, at Temple Hill, Cork, thousands are now "tossing their heads in sprightly dance." The following to bloom in March:—

50,000 PRINCES	30,000 VARIOFORMIS
30,000 NOBILIS	10,000 CORBULARIA CITRINUS
20,000 ARD-RIGH	10,000 PALLIDUS PRÆCOX
5,000 MASCATUS	100,000 TELAMONIS PLENUS
5,000 CAPAX	10,000 PSEUDO-SCOTICUS.

A semicircular border, containing over 5000 bulbs of the beautiful WHITE DAFFODIL "LEDA," is a sight not to be seen in the United Kingdom. William Baylor Hartland's unique Collection of Rare White Daffodils will all bloom this month.

** Boxes of Cut Specimens, true to name, from 5s., 7s. 6d., to 10s. With each order for a "Box of Blooms" will be presented a copy of his "Little Book" of Daffodils, unique as a work of art, and faithfully illustrated by Gertrude Hartland, the Book by itself being 1s. 6d. each copy.

Address for Blooms to
TEMPLE HILL, CORK.

FRUIT TREES, SEVENTY-FOUR ACRES.

APPLES, PEARS, PLUMS, CHERRIES, PEACHES, NECTARINES, APRICOTS, and other FRUIT TREES, as Standards, Dwarfs, Pyramids, Buses, Cordons, and Trained Trees, in great variety.

VINES, excellent Canes, 3s. 6d. to 7s. 6d. Orchard House Trees in pots, PEACHES, APRICOTS, NECTARINES, &c., from 5s. FIGS from 3s. 6d.

DESCRIPTIVE LIST, containing a sketch of the various forms of Trees, with Directions for Cultivation, Soil, Drainage, Manure, Pruning, Lifting, Cropping, Treatment under Glass; also their Synonyms, Quality, Size, Form, Skin, Colour, Flesh, Flavour, Use, Growth, Duration, Season, Price, &c., free by post.

CUT SPECIMEN FLOWERS OF BARR'S HARDY DAFFODILS

CAN BE HAD DURING APRIL.

We are prepared to send, on application, during April, Cut Specimens, correctly named, and carefully packed, at the following charges:—

12 distinct sorts, 1 flower each	3s. 6d.	25 distinct sorts, 1 flower each	6s. 0d.
12 " " " " 3 flowers each	9s. 6d.	25 " " " " 3 flowers each	15s. 0d.
50 distinct sorts, 1 flower each	11s.		
50 " " " " 3 flowers each	30s.		

Our aim in thus offering to the Public, Cut Specimens of our Beautiful Hardy Daffodils, is to afford an opportunity to those who cannot visit our Daffodil Grounds, of acquainting themselves with the many lovely varieties we have been bringing before the Public the last few years, at the various London Spring Shows. The flowers cannot be sent in bud, as this would prevent us proving our "Stocks," which is done annually; but they will be sent fresh, and packed so as to ensure their arriving in good condition.

TROPICAL AQUATICS.

BRITISH GUIANA.

EICHORNIAS AT HOME. — Adverting to the excellent illustrations of these beautiful and interesting plants published in the *Gardeners' Chronicle*, vol. xxv., pp. 17, 113, 1886, I may add that three or four species are very common here in Guiana, one of which, *E. speciosa*, occupies thousands of acres, many of which I see almost daily. Georgetown streets are intersected with wide canals, the surfaces of which are at times covered with such gregarious weeds as *Victoria*, *Nymphaea*, *Cabomba*, *Eichornia*, *Pistia*, *Utricularia*, *Ceratopteris*, *Marsilia*, *Azolla*, *Salvinia*, &c. I have said at times, because every now and then, with the general clearing up of the town, the canals are cleared of the surface weeds. If this should seem strange to any Northern reader, who has, perhaps, a high regard for these plants, some of which are very beautiful, let me explain that here springtime and summer are eternal—that weeds spring up in the wide-stretched smokeless towns, as well as in the country, and even their greater *confrires*, trees and Palms, are only kept down by the relentless rigour of municipal order and neatness.

Then the canals which surround the sugar estates, usually miles long, and which intersect the fields at right angles, are also covered in the same way during most of the year with these aquatics; lastly, *Eichornia speciosa* lines several of the smaller rivers in broad bands, which often stretch for leagues unbroken in length. The water in the canals and trenches of the town and the estates varies from 2—5 feet in depth, and in the parts of the rivers that are occupied it is several feet deeper. But in disused trenches on the sugar estates, that are more or less silted up, plants are found in patches, or mixed with sedges and grass here and there, and in these trenches the roots penetrate the mud on which the plants rest. But by far the greater part of the vast abundance of *Eichornia speciosa* found in the

colony—and also that which is most luxuriant—is in deep water, where the roots cannot reach the ground. In such situations it is gregarious, and, like several of the other plants I have mentioned, is rarely, or very little, mixed with the other weeds, and forms glorious unbroken sheets, in its earlier stages of growth displaying a wealth of pale green foliage, and subsequently of delicate azure-blue bloom. On the Canje River large masses frequently break away from the main colonies that line the river, and, meeting together, block the entire width of the river, and greatly impede navigation. Large snakes often lurk in these freed masses, and are with them floated to new situations, and occasionally find their way into boats or vessels lying at anchor, against which the weeds have drifted during the night. At length, after floating in the estuary with the tide for a few days, these plants are carried out to sea, and there perish, with the live creatures they may contain, if they are not caught by the coast currents, and carried to other rivers or situations where they can maintain life—for the water along our coast, owing to the great rivers which pour their volume into it, is only partially salt.

The inflation of the petiole is so contrived as to give the utmost support the tissue is capable of to the leaf, as a sail for the wind to act on; but I do not think this is a chief object, and for this reason, that it is most available where least required for such a purpose. When the plants are young the leaves spread nearly horizontally, and at this period of their growth the petioles are most inflated, and resemble small Onions or large Gooseberries, of which they are about the size. As the plants develop the leaves become more and more erect, till in time they are quite perpendicular—that is, in beds of large healthy and vigorous plants; and as the leaves thus change the angle of direction the petioles gradually diminish in diameter, till in the ultimate leaves the inflation has almost or entirely disappeared. Here, in Guiana waters, at any rate, the leaves act very little as sails in the dispersal of the plants, which latter, when they break adrift, are carried almost entirely by currents to whatever destination the nature of the place in which they are located may permit of their reaching. All the species I know grow in the full open sunshine.

Like nearly all aquatic plants, the Eichornias spread exclusively by the medium of water. The seed floats, and wherever there is water communication it spreads; but the narrowest strip of land that excludes communication will permanently prevent its passage from one water to another. For instance, in the extensive lakes dug several years ago in these gardens not a plant of *Eichornia speciosa* has yet appeared, though it is growing in profusion in the trenches of all the surrounding properties; and in the Lamaha canal, that supplies Georgetown with water from the interior, I have never seen any such plants—an immunity due simply, I believe, to its high level and still higher banks, which prevent the water of the outside trenches, though only a few yards off, from ever running in. I have no doubt, however, that animals of aquatic habit, such as alligators, as they pass from one water to another, may possibly sometimes carry seed adhering to their bodies, and so aid in the dispersion; but this form of communication, though alligators are common, has not yet occurred in the waters I have just mentioned. Once established, which would soon be done by the introduction of seed or a few plants, it is difficult to eradicate, though this might be done, of course, by removing the plants before they arrive at the flowering stage. It is estimated that about 25,000 dollars are spent in this colony every year in keeping down this and other aquatic weeds in the canals and trenches; for so slight is the fall or gradient available, that a covering of weeds in the draining trenches almost entirely stops the flow,

and in the navigation trenches, by which the cane are transported from the fields to the manufactory, passage would be impossible if the Eichornias were not cleared away.

The conditions under which the young plants come into life and spread over the water are very curious. One sees an extensive sheet of water suddenly covered with tiny plantlets, there being no spaces between them, and one would think that the seeds had been placed by hand just so far apart as to give the infant plant the exact room and no more than it required. But at this time the plants are less than one inch high, and when they are full grown one finds they still have just the space required and no more, there being at any time of the growth hardly an inch wasted anywhere. The explanation is that living in such a plant medium as water they make for themselves the elbow-room required by pushing each other outward and onward till the whole water, or the area they require of it, is covered with the sheen of their pure and delicately coloured leaves. At this time each individual plant is free from communication with its neighbours, but subsequently they throw out stolons, just as Strawberries do, and thus they interlace and become in time so matted that the entire lot forms a homogenous mass. Extensive sheets abound of Azolla and *Salvinia*; these plants are always free from one another—there is no crowding, no overriding each other, but each plant has exactly the space required for it with hardly room for the end of a quill to be inserted anywhere between them, all other plants are excluded from the community. I may mention that cattle are very fond of both *Nymphaeas* and *Eichornias*, and may often be seen in the trenches of estates up to their backs in water licking the herbage off the surface. Coolies also, who feed cows, invariably cut to the level of the water any *Eichornias* they have access to. *E. speciosa* is the most aggressive, and taking the great extent of it, the most obtrusive species here; but one tires of anything, however beautiful, that is so common; and I think *E. natans*, which has floating leaves not much larger than a shilling, with darker blue flower, and which grows in patches along the rivers, is the prettiest of all the kinds we have. *E. tricolor*, mentioned by Mr. Ridley as common at Pernambuco, I have not come across in Guiana. *G. S. Jenman, Government Botanist, British Guiana, Feb. 1.*

NEW OR NOTEWORTHY PLANTS.

AGAVE (EUAGAVE) BAXTERI, *Baker, n. sp.**

This is a new species of Agave, which is now in full flower in the Cactus-house at Kew. It resembles *A. americana* and *mexicana* on a dwarf scale. It was received in 1882 from the botanical garden of Oxford, and no doubt is a native of Mexico.

Leaves about thirty, in a dense sessile rosette, oblanceolate, about a foot long, 3 inches broad above the middle, narrowed gradually to 1½—2 inches above the dilated base, very glaucous when young, the pungent brown tip shortly decurrent, the spreading hooked deltoid-cuspidate brown, marginal spines ½—¾ inch long at the middle of the leaf. Peduncle 4—5 feet long before the flowers begin. Panicle thyrsoid, lax, 4—5 feet long; branches stiffly erecto-

* *Agave (Euagave) Baxteri*, Baker, n. sp.—Acaulis; foliis circiter 30 dense rosulatis oblanceolatis pedalis glaucis, apicâ terminali pungente breviter decurrente, aculeis marginalibus magnitudine mediocribus brunneis uncinatis; panicula thyrsoides 4—5 pedali; floribus ad ramorum apices dense glomeratis; ovario cylindrico-trigono unciali; perianthii tubo semipollicari medio dilatato, segmentis lanceolatis tubo æquilongis; staminibus breviter exsertis.

patent, the central ones not more than 3—4 inches long, bearing the flowers in a single dense cluster at the tip. Ovary cylindrical-trigonus, an inch long. Perianth tube yellow, ½ inch long, suddenly dilated at the middle; segments lanceolate, as long as the tube. Filaments inserted at the throat of the tube, ¾—1 inch long; anthers linear, ½ inch long. Style just overtopping the stamens. *J. G. Baker*. [This handsome species was exhibited at the meeting of the Royal Horticultural Society on Tuesday last. Ed.]

COELOGYNE HUMILIS, (*Lindl.*) *ALDATA, n. var.*

This is now blooming in the establishment of Mr. F. Sander, who kindly sends it to me. The sepals and petals are snow-white, the lip also, but with light mauve-purple radiating lines over it, which are seen to consist, when carefully inspected, of numerous small confluent spots. A conspicuous orange spot occurs on each side on the anterior part of the lip. It is a gem quite distinct from *Cœlogyne humilis*, Lindl. (= *tricolor* mihi) that flowered first in March, 1880, with Mr. W. Bull, then with Mr. B. S. Williams, who gave a nice representation of it in the *Orchid Album*, iii., 102. It is a very curious fact that the top of the column in *Cœlogyne* is subject to numerous variations. The queerest came from Mr. C. G. Hill. Two flowers from Khasi, given me by my late friend, Mr. J. G. Veitch, have the one an entire, the other a trifid androclinium. Excepting this they are quite equal. *H. G. Rehb. f.*

DENDROBIUM PITCHERIANUM, *n. hybrid. nat.*

Mr. F. Sander kindly sends me a two-flowered raceme of what he supposes to be a natural hybrid between *Dendrobium primulinum* and *D. nobile*, asserting that the stem is quite like that of *Dendrobium nobile*, and wishing me to name it in honour of Mr. J. R. Pitcher, Shorthills, New Jersey, U.S.N.A., a most enthusiastic orchidist. The flowers are equal to those of a good *Dendrobium primulinum*. Both sepals and petals are much like those of that species, as they are rather narrow and straight. The ligulate blunt sepals are whitish, rosy, with fine purple tips. The petals are broader, with a deep purple tip, and a broad distinct rosy mid-line from the tip to the base. It is an exceedingly curious and rare fact, that the colours of the flowers are far deeper outside. The lip is very interesting. From a short stalk, green at the base, it is enlarged into a heart-shaped semi-oblong subacute body. This, however, is the outline after artificial expansion, and it answers well the outline of the lip, not of *Dendrobium primulinum*, but of *Dendrobium nobile*. Naturally the lip is involute at the base and subacute before the apex, thus making a sort of a *goltre* with a flat surrounding margin. Its colour is light sulphur. The callous abrupt line in the middle of the disc before the base is whitish. The apex of the lip is purple, and there are dark purple, nearly parallel stripes on both sides of this callous part. Both sides of the surface of the lip are most densely covered with very short hairs. The column is small, green, with semisigmoid side wings at the sides of the anther, and with a linear purple tooth in the middle of the back. There is no little hollow to be seen at the base of column. It may, however, appear in the established plant. The anther looks quite abortive. It is very thin, its upper part looking like a purple Phrygian cap that has been made of an insufficient quantity of cloth. The bulbs and leaves are said to be like those of *Dendrobium nobile*. I think Mr. Sander's suggestion about the origin is quite right. *H. G. Rehb. f.*

ONCIDIUM (CYRTOCHILUM) DETORTUM, *n. sp.**

This is a fine *Cyrtorchilum*, comparable to *Oncidium serratum* and to *O. lamelligerum*. I had splendid materials from Mr. F. Sander, but do not

* *Oncidium (Cyrtorchilum) detortum*, n. sp.—Pedunculo volubili forti multirameo; ramis paucifloris (ad 4); bracteis spatulaceis acutis ovaria pedicellata dimidio-subquantibus; sepalis unguiculatis oblongis acutis undulatis, unguibus basi auriculatis; tepalis brevibus unguiculatis oblongis acutis undulatis; labello trifido, laciniis lateralibus triangulis divaricatis, lacinia mediana ligulata acuta, carinis infima basi septenis

know the old bulb, which may be like those of the just-named species. The leaves are broad, oblong, acute, and of light green in their youth. The inflorescence must make a considerable mass, the fragments kindly sent me exceeding 5 feet in length. The flowering branches of the very strong twisted peduncle are short, and I have none with more than four flowers. They are of the shape of those of *Oncidium serratum*, but a little smaller. The sepals are very shortly unguiculate and auriculate, cuneate, oblong, acute, wavy, light brown, the odd sepal with a little yellow at the upper part. Petals with shorter stalks, very wavy, yellow, with brown spots. Lip with two rectangular, spreading, triangular side-lacinia, and a ligulate, acute, protruded mid-lacinia. The system of calli is very complicated and peculiar. At the base there stand seven parallel linear keels, three of which are longer than the others, which are easily overlooked. In front there is one keel, and on each side of it a series of four subulate acute bodies. Then there is a keel on each side forcing it from the outside and bent at a right angle parallel with the four small subulate teeth. The column is acute at the top and has two small cuneate bidentate wings. *H. G. Rehb. f.*

DENDROBIUM MACROPHYLLUM (A. Rich.) STENOPTERUM, n. var.

The greater number of specimens of *Dendrobium macrophyllum* (A. Rich.) (Veitchianum, Lindl.) have irregularly square side lacinia to the lip, and a very conspicuous chin. Mr. W. Bull has just sent me a small flowered raceme. The side lacinia of the lip are triangular and narrow, and the mentum is very inconspicuous. The sepals and petals are ochre-yellow, spotted with dark reddish-brown dots outside (not inside!) The lip is yellow, with numerous dark brown dots on the outside, and rather pallid spots and markings on the inside of the mid-lacinia, while there are a few brown lines on the side lacinia. The column has mauve-purple lines and spots under the yovea. I had the same plant before once, but with yellow flowers. *H. G. Rehb. f.*

CALADIUM BICOLOR GEHEIMRAT SINGELMANN.

Disc of leaf and nerves yellow, with fringes of red colour along the side of the nerves.

SCOTLAND.

TUBEROUS BEGONIAS AS BEDDING PLANTS IN SCOTLAND.

Your note on p. 307 respecting the growing interest in the above in Scotland and America as bedding plants recalls several notes of my own experience on the subject, dating back more than ten years. On reading your note I was reminded of the brilliant effect produced by several masses of tuberous Begonias planted in the kitchen garden at Drumlanrig about eleven years ago. They were ordinary seedlings—very ordinary, as compared with the beautiful varieties that may be reared from seed at the present time; yet they were even then more effective than the average bedding Pelargonium. They stood the climate well—that is, the climate of Drumlanrig—therefore were a good test for Scotland generally, for that famous place for flower gardening has been made so more by the munificence of its late proprietor and the skill of the present gardener than by any local advantages of soil or climate, for these are wholly bad. But to come to the point: it would be interesting to know whether Mr. Thomson still thinks as well of tuberous Begonias as he appeared to do with good reason about the time alluded to. His intention then was to extend his experiments with them. If he did so, his experience would be interesting if recorded.

parallelis, geminoris externis utrinque minutis, carina anteposta longa serie quatuor papularum subulatarum utrinque, carina ex margine exteriori insuliente, dein antorsum decurrente parvula cum apiculis quaternis jun descriptis; columna vertice acuta albis minutis cuneatis apice bidentatis. Mis. ex. Sander. *H. G. Rehb. f.*

From my own experience, though limited to the North in this particular, I can say I am entirely in favour of the adaptability of tuberous Begonias to the purpose of bedding-out in Scotland. In proof let me state, that about nine years ago I had charge of a place not far from Edinburgh, where my predecessor had bedded out a considerable number of the subjects in question the previous summer, but had omitted to lift the tubers in autumn. On commencing in spring to turn over the borders in which they had been planted, a very considerable number of fine healthy roots of the Begonias were dug up. They were perfectly sound, and on being put into heat started with a vigour that soon outstripped the dry stored winter tubers. A selection was kept for the greenhouse and the rest planted out, with the result that they proved they gayest things and most admired flower garden plants that season.

What became of those beautiful varieties of *Boliviensis*, *Sedeni*, *Vesuvius*, I know not; but the next prominent example of success with tuberous Begonias as bedding plants that came under my notice in Scotland, occurred last year in Mr. John Downie's nursery, Beech Hill, Edinburgh. In this case the varieties were much superior to those I had to do with nine years previously. The varieties, although represented to me as being merely seedlings, were so fine in the size and colour of the flowers, and in the habit of the plants, as to suggest the idea that they were a batch of selected sorts that had by accident lost their labels, and been planted out, as is often done in such cases, to give an opportunity for identification. My experience of bedding-out in Scotland has been very limited during the past nine years, I am, therefore, unable to say what progress has been made in the use of tuberous Begonias; but Mr. Downie assured me that he was so much impressed with the interest taken by visitors in his display of them last summer, that he intended to have a large stock of tubers to offer to his customers for the next season. *Boliviensis*.

ORCHIDS AT THE KILNS, FALKIRE.

Few places of more interest to the Orchid fancier exist in Scotland than this. It is situated on a steep sunny slope about three-quarters of a mile to the west of Falkirk, well sheltered from the north and east. Mr. Gair's horticultural tastes are thoroughly catholic, consequently he has combined a rich variety of feature with excellent taste. The collection of Orchids is more remarkable for the number of choice and valuable things it contains than for its extent. A flowery collection it could not be called at the time of my visit, but the good health of every plant was a gratifying sight, and reflected credit on the cultural skill of Mr. George Fairbairn, who for the last nine years has had charge of it.

The following amongst other evidences of superior culture were noticeable:—*Dendrobium Jamesianum*, having eleven strong one-year-old growths and many of greater age, is probably one of the finest specimens of this species in the country; *Odontoglossum* have exhibited enormous pseudobulbs, 5 to 6 inches in length, and 2½ inches in diameter, from which were arising spikes of corresponding luxuriance; *O. Pescatorei*, a robust plant and a grand variety, bore three spikes of an average length of 4 feet each, of which one bore ninety-five blooms, and the others eighty each; *O. crispum*, a variety with pure white flowers of great substance and 5 inches across, the spikes rising from pseudobulbs 6½ inches long, is a much prized plant of Mr. Gair's. *Dendrobium Walkerianum* and *D. chrysotoxum* were to be seen in magnificent examples about 3 feet through and correspondingly high, thickly studded with flowering growths. The collection of *Odontoglossum crispum* consists of the best selections from Messrs. Veitch's celebrated importation of 1865. Other forms of the genus are numerous and choice. A fine plant of *O. Rossi majus* was remarkable for the depth and purity of its colour and the size and substance of its flowers which measured over 3½ inches across. *O. cordatum Patersoni* and *O. maculatum superbum*

were blooming freely. Two fine plants of *O. pulchellum majus*, about 2½ feet across, and differing somewhat in the purity and size of the flowers, were unusually free in the display of bloom. *O. biconense album* was here represented by a very fine plant, blooming freely. A remarkable variety of *O. triumphans*, with a spike of eleven blooms of great substance and depth of colour; and *O. Cervantesi decorum*, which in regard to the chaste and delicate colouring it presents is one of the most charming of Orchids, must close my notes on *Odontoglossum*.

Amongst *Cattleyas*, one form of *C. Trianae* was very noticeable, on account of a deep yellow bar extending along the middle of the two lower sepals from their base to their tips. The ground colour was deep rosy-purple, and the flowers were otherwise remarkable for their great size and good substance. *C. Trianae alba* was represented in a very fine plant passing out of bloom, and an equally good plant of *C. Warscewiczii delicata*, which was at its best, and in its chaste colours, completes the list of this genus in flower. We noticed, however, splendid plants of *C. crispata*, *C. purpurata*, *C. labiata*, *C. Warneri maxima*, *C. aurea*, *C. exoniensis* × *C. Bluntii*, *C. Harrisoni*, *C. violacea*—the latter said to be the finest in the country, and *C. crocata*, fine well developed plants, in luxuriant health. Regarding *C. dolosa*, which attracted attention by its fine growth, I noted that Mr. Fairbairn, contrary to usual practice, grows it in his warmest houses. He finds it grows more freely and flowers better when so treated.

Cypripediums are well represented by healthy well grown plants.

Of *Cologoyes* there are a number of very fine plants of *C. cristata*. A recently imported piece of the species, occupying a pan about 2½ feet through, in flower, showed three distinct forms one the ordinary form and colour, another with a deep orange bar, and the third with a clear pale lemon bar on the lip, each of the two latter having also well marked but indescribable differences in the size of the parts of the flowers. There were also specimens of the old-fashioned but interesting *C. media* and *C. faccida*.

Calanthe Regnelli was flowering well, and exemplifying its usefulness as a late flowering species. At The Kilns it appears to form branching spikes. Is this the general experience with it elsewhere, or is it merely the result of extra luxuriance? As the branches appear to succeed the principal spikes, the peculiarity is a desirable one, as prolonging the period of bloom.

Aerides, *Saccolabium*, *Angraecum sesquipedale*, *A. Mastersii*, *A. hyaloides*, and *A. citratum*—the two latter showing their interesting flowers in baskets suspended from the roof—were growing in the same atmosphere as specimens of *Phalenopsis Sanderiana*, and others, all, particularly the latter, being in splendid health. Near by these also were capital plants of *Dendrobium Brymerianum*, *Cymbidium Lowii* coming into flower, *C. eburneum* in full flower, and fine plants of *C. e. Dayanum*.

Masdevallias are well represented by grand plants, but they had mostly ceased flowering when I saw them. S.

MUSHROOM GROWING WITH LEAVES AND LITTER.

Is the present orthodox system of making elaborate selection and preparation of materials with which to grow Mushrooms essential to success? I consider it unnecessary to follow the instructions generally given, to exclude all the straw from the droppings, to have them removed under cover, and thrown into a heap, then thrown out into ridges, and turned about for the best part of three weeks. Neither is horse manure an essential material wherewith to produce Mushrooms of good quality. This season it so happened we did not require the usual places in the Mushroom-house set apart for the growing of Rhubarb, Seakale, &c., and it occurred to me that this space might be utilised for Mushrooms. I happened to have a large

heap of material of which I was constructing hot-beds and covering Vine borders which contained Vines we had lifted: this heap consisted of old stable-litter, which had laid in a heap for six months, and was quite white with mould, and dry for want of rain sufficient during the late summer to produce fermentation. This dry stuff, be it remembered, had the larger proportion of the droppings shaken out for the forming of Mushroom beds in the usual way as it was brought from the stables. This, with some fresher litter brought from the stables, together with fallen leaves of various kinds—a mixture of Spanish and Horse Chestnut, Lime, Elm, Ash, and Beech—the latter predominating—was all thrown into a heap in the dung-yard in the proportion of three cartloads of leaves to one of litter. The heap was turned three times, at intervals of about four days each, and was then made up into beds in the Mushroom-house, trampling it down hard. The depth of the bed when completed was about 18 inches. When the internal temperature of the bed had fallen to 85°, spawning and soiling over were done in the usual way. To-day the beds are carrying a good crop of Mushrooms, in size equal to those grown on beds formed entirely with droppings. I send you a box with a clump lifted from the bed, also a portion of the material. [A very nice sample. Ed.]

The cause of failure to grow Mushrooms is often to be traced to the bad quality of the spawn, but I have not had a failure for many years. There are many persons who would like to turn their attention to growing Mushrooms, but are deterred therefrom on account of the difficulty of procuring the horse-dung. Now, if any one would-be cultivator will procure three cartloads of dry leaves and one load of long stable litter, and ferment them, he will not fail to get a good crop of Mushrooms.

In these times of agricultural distress I consider it a censure upon our intelligence and enterprise when we import from the Continent every year such a very large quantity of this favourite esculent, which could be reared at home and sent to our markets in good condition, and even exported to the Continent. There are many sheds standing about farmsteads unoccupied during a great portion of the year which might be utilised for the growing of Mushrooms. It is not as if the growth of these deprived the land of its dressing of manure, for the manure is still useful as such after it has yielded its crop. To grow Mushrooms in farmyard manure alone would necessitate its being turned over frequently, in order to get rid of the strong heat. *W. M. Baillic, Luton Ho.*

ROOT-CROPS.

An important and valuable contribution to agricultural literature has just been published, *On the Growth of Root Crops*, comprising the results of forty-five years' experiments at Rothamsted,* much of which may with advantage be applied to horticultural practice.

The introduction of Turnips, says Professor Gilbert, into agricultural rotations may be said to have been one of the most important improvements of recent times. From certain characters of the Turnip plant, especially its abundant leaf-surface, and from certain conditions of its growth, it has frequently been assumed that it is largely dependent on the atmosphere for its nitrogen, and that it is, in fact, a collector of nitrogen for the crops grown in alternation with it.

But the experimental evidence brought forward from the Rothamsted experiments does not support this conclusion, showing that Turnips depend for their successful development on large quantities of manure; for when grown without manure, even from the same seed as the manured crops, either for a few years in succession on the same land, or even in rotation, they soon revert to the uncultivated condition.

* Lecture by J. H. Gilbert, M.A., LL.D., F.R.S., Sibthorpean Professor of Rural Economy in the University of Oxford, at the Royal Agricultural College, Cirencester.

The object to be attained in the cultivation of root crops, says the author, is to encourage by artificial means an abnormal development of a particular part of the plant. If the Turnip were grown for its natural seed product, oil, a heavier soil would be more suitable than when the object is to develop the swollen root; in our climate a biennial habit would be induced, and it would be so grown as to be exposed to the summer temperature at a later stage of the development, or life history, of the plant, that is, at the seed-forming and ripening period. Under these circumstances there would be much less of fibrous root distributed through the surface-soil; the main root would be much less bulbous and more fusiform, tapering rather than spreading laterally: the leaves and stem would be much larger both actually and proportionally to the root, and the enlarged root itself would serve as a store of material for the second or final growth.

If nitrogenous manures are used in excess for the Turnip crop, that is, in such amount as so to force luxuriance that the roots do not properly mature within the season, there is found to be not only a restricted production of root, but an undue amount and proportion of leaf. In fact, it is found that the higher the nitrogenous manuring and the heavier the soil the greater is the tendency to produce leaf rather than root.

In the case of both common and Swedish Turnips, the leaf contains a much higher percentage of dry substance than the root; and the dry substance of the leaf contains a much higher percentage of both nitrogen and mineral matter than does that of the root.

COMMON TURNIPS.

Common Turnips yield a much larger proportion of leaf to root than Swedish Turnips or Mangels, and if the leaf be unduly developed, there may even be more nitrogenous and mineral matter remaining in the leaf to serve as manure again, than is accumulated in the root to be used as food.

The selection of the proper description of roots to be grown cannot be settled merely by a consideration of the amount of produce obtained from a given quantity of manure, or of the proportion of the crop which is available as food for stock, or which only remains for manure again, or of the high or low percentage of solid matter in the food portion of the crop. The general economy of the farm, the character of the soil, but more especially that of the climate of the locality, must also be taken into account. The great influence of climate is strikingly illustrated by the different proportions in which the different descriptions of roots are grown in different divisions of the United Kingdom, as shown by the following table:—

Area under Turnips and Mangels in England and Wales, and Scotland.

		Mean of Five Years, 1882—1886.			
		Actual area.		Percent. of total area.	
		England and Wales.	Scotland.	England and Wales.	Scotland.
		Acres.	Acres.	Per cent.	Per cent.
Turnips *	...	1,531,921	487,810	81.9	99.7
Mangels...	...	337,521	1,432	18.1	0.3
Total	1,869,442	489,242	100.1	100.0

* Including Swedes.

It is seen that the average area under the various descriptions of Turnips is, in England and Wales, rather over 1,500,000 acres, whilst in Scotland it is less than half a million acres. Again, the average area under Mangel Wurzel is 337,521 acres in England and Wales, and only 1,432 acres in Scotland. Further, whilst about 18 per cent. of the total area under roots in England and Wales is devoted to Mangels, less than a third of 1 per cent. of the total area in Scotland is devoted to that crop.

SWEDISH TURNIPS.

The root of the Swedish Turnip contains a smaller

percentage of water, that is, a higher percentage of solid matter or food-material, than that of the common Turnip. The dry or solid matter of Swedish Turnip root also contains a lower percentage of mineral matter, and, consequently, a larger proportion of organic food substance. Superphosphate is more beneficial to Swedes and Turnips than to Mangels, but in each description of plant the amount of dry substance grown has a very direct relation to the amount of nitrogen available within the soil. But more vegetable substance was produced, and more stock food yielded, from a given quantity of nitrogenous manure applied to Mangels than to either description of Turnips.

By the application of nitrogen to the soil for Mangels there was, in many cases, an increased assimilation of about a ton of carbon per acre from the atmosphere.

The experiments showed a higher percentage of dry matter in Swedish than in common Turnips, and a higher percentage in Mangels than in Swedes. But with each description of roots the range in the percentage was considerable, according to season and to manuring. The percentage of dry matter was the lower, the greater the excess of nitrogenous manure, the greater the luxuriance, the larger the crops, and the less matured the roots; and it was, conversely, the higher the more matured the roots. The percentage of mineral matter in the roots was the higher the greater the luxuriance, and the more crude and unripe the roots. The percentage of nitrogen in the roots was small, and very variable. It was the higher the more nitrogen was applied by manure, the greater the luxuriance, and the less matured the roots; and it was the lower the riper the roots.

MANGEL WURZELS.

The proportion of Mangel leaf to root is, as a rule, very much less than in the case of common Turnips, but more than in that of Swedish Turnips.

With the more extended root range of the Mangel, it is less dependent on continuity of rain when growth is once well established; and it requires for its full development a higher temperature than the Turnip.

The Mangel root contains a higher percentage of solid matter than either common or Swedish Turnips. But whilst the Turnip leaf contains a much higher amount of dry matter than the Turnip root, the Mangel leaf contains a much lower percentage of dry matter than the Mangel root, and also a very much lower proportion than the Turnip leaf.

As in the case of Turnips, the dry substance of the Mangel leaf contains a much higher percentage of both nitrogen and mineral matter than does the dry substance of the root. Indeed, the dry substance of the Mangel leaf contains not far from twice as high a percentage of mineral matter as that of the Turnip leaf; but it contains upon the whole a rather lower percentage of nitrogen than that of the Turnip leaf. It would seem that the Mangel leaf is more fully exhausted of migratory organic matters in the greater development of the root than is the Swede leaf; and more still than the common Turnip leaf.

Taking the average of six years the amount of nitrogen recovered in the increased crop of Mangel roots was about 60 per cent. of that supplied when nitrate of soda was used; about 42 per cent. when ammonium salts; about 50 per cent. when rape-cake, and about 46 per cent. when an excessive amount in a mixture of rape-cake and ammonium-salts was employed. There was, also, an additional amount accumulated in the leaves, but these were annually returned to the land as manure.

When farmyard manure is applied for Mangels, larger amounts of nitrogen as supplied per acre than were used in any of the Rothamsted experiments with artificial manures, a less proportion of the nitrogen supplied is recovered in the increase of crop, and more remains for the future crops. It is the nitrogen in the urine of the animals that is first rendered available within the soil, then that of the finely comminuted matter mixed with some

secretions in the solid excrement, and finally that of the litter.

Nearly two-thirds of the dry substance of Mangels was found to be sugar. The percentage of sugar was the greater as the roots were the more mature, and it was consequently the greater in the roots of the smaller crops. But the amount of sugar per acre was much the greatest with the largest crops; that is, when the most nitrogen was applied in the manure. The roots grown by farmyard manure alone contained more than 1 ton of sugar per acre, and by the addition of artificial nitrogenous manure to the farmyard manure there was an increase of more than half a ton of sugar per acre. In several cases the addition of artificial nitrogenous to a complete mineral manure increased the production of sugar by more than a ton per acre.

By the addition of nitrogenous to a complete mineral manure, 1 lb. of nitrogen applied as nitrate of soda yielded an increase of 22.1 lb. of sugar; 1 lb. nitrogen as ammonium salts, 19 lb. of sugar; 1 lb. as rape-cake, 20.8 lb. of sugar; and 1 lb. of nitrogen applied in excessive amount in a mixture of rape-cake and ammonium salts gave an increase of only 13.7 lb. of sugar.

Feeding roots are essentially sugar crops. Although the percentage of dry matter varies considerably with each description of root, according to the conditions of growth, the average amount of dry matter may be taken as, approximately, 8 per cent. in white Turnips, 9 per cent. in yellow Turnips, 11 per cent. in Swedes, and 12.5 per cent. in Mangels. Of the dry matter of white and yellow Turnips nearly or more than half may be sugar; of that of Swedes more than half, and of that of Mangels nearly, or as much as two-thirds may be sugar.

In cereal grains the proportion of albuminoid matter to non-nitrogenous food materials about as 1 to 6. In roots the albuminoid ratio varies very greatly; and it is probably seldom more than 1 to 12, and frequently as low as 1 to 20, or more. The ratio will probably, as a rule, be lower in Swedes than in common Turnips, and lower still in Mangels.

ORCHID NOTES AND GLEANINGS.

PONTHIEVA GRANDIFLORA, *H. N. Ridl.*, in *Gard. Chron.*, March 3, 1888, p. 264.

It is very satisfactory to learn what are the colours of the Ponthieva (*Disepale*) *andicola*, *Rchb. f.*, described as long ago as 1876 in Professor Garcke's *Linnaea*, xli., p. 52, No. 161. I am sure to be right when combining the two names, as the greater part of the description and the original fully agree, and as two of Dr. Spruce's specimens are before me, I feel greatly surprised at the words "lamina longiformis." "Forma" means the circumference of a body, and "longus" one of the dimensions. Those words cannot be combined, and the expression reminds me of a Sesia, a butterfly, which was called "rubriformis." (Another lepidopterologist wished to improve the name, and named the wasp-like creature in compliment to its discover, "Schmidtiformis," although Mr. Schmidt was quite a normal gentleman.) I have described the lip at the place quoted, "labello longius unguiculato extenso, triangulo sagittato."

There is a group of four species, which are like old Ponthieva maculata of Dr. Lindley, but which have the lateral sepals more or less connate: *sylicola*, *andicola*, *cornuta*, *inudita*, all described by me in the journal cited as early as 1876. My Ponthieva *andicola* was most probably discovered by our excellent friend the late Professor Jameson, who sent it (long before he was my correspondent) to Sir William Hooker. It was also collected by the late Dr. Seemann in Ecuador, being his No. 897. Then Dr. Spruce gathered it at Ljalla, in the Quitinian Andes. I have not the least hesitation in publishing the locality, as the plant will never be searched for by the amateur *à la mode*, though it might be very welcome to collectors

who have a heart for lovely small things, and to botanic gardens. I do not believe, however, that it could be brought over to Europe when packed, or, if you like better, not packed, in the usual manner. I remember a collector who danced a polka mazurka over his Cattleyas to press them down so as to have more space, &c. A good traveller, having a heart for plants, might bring it himself.

I have two specimens of Dr. Spruce's, one of which is two-leaved, one one-leaved. Some very curious specimens from Mr. (now Consul) F. C. Lehmann are smaller, and may come from a very high altitude. They have rather small leaves, and one is four-leaved, and has two peduncles, which would be quite extraordinary. It appears that, alas! the under parts of the specimens are affected by mould, and scarcely permit of softening. Yet I looked very carefully to the status, and believe I am right. *H. G. Rchb. f.*

LELIA ALBIDA VAR. SULPHUREA

Is a lovely chaste variety; like the species, it is a compact evergreen plant; the pseudobulbs are oval, ancate, about 3 inches high, each bearing a pair of lanceolate-acute leaves; the spike is produced from the top of the bulb after growth is completed; the sepals and petals are sulphur-yellow, whilst the top is crested with orange, the anterior lobes being tipped with a dull rosy-purple colour. Independent of their beautiful colour, these flowers are deliciously fragrant, which considerably enhances their value, as everyone admires sweet-scented flowers. It blooms in our stoves during the months of November and December, and remains in beauty for several weeks.

The species here portrayed was grown by Mr. Maulden, the gardener in charge of Mr. Walley's collection. It was placed in a basket and suspended near the roof-glass, that it might receive the full benefit of the sun and light, whilst the potting material was simply rough fibrous peat. All Mexican Orchids require a great amount of sun under cultivation; a slight shade is, however, beneficial during the hottest part of the day, as it prevents the leaves from becoming scorched by the glass. In their native country these plants grow at from 1000 to 6000 feet elevation, exposed to the full sun and rain, where it is very hot during the day, and the nights very cool. While they are growing a liberal supply of water is absolutely necessary for their roots, and a slight syringing daily. "*Orchid Album*," February.

CATTELEYA BICOLOR

Is a very distinct and desirable species; it also has the additional recommendation of blooming in the autumn months, when flowers are usually scarce, and single flowers, when mounted, are very much in request for buttonhole decoration and similar purposes. . . . The material which Mr. Simkins, who has charge of Mr. Measures' collection, uses for this species is rough fibrous peat. The pots, however, are thoroughly drained by being filled three parts full of potsherds, over which is placed a thick layer of sphagnum moss. The plant should be elevated upon a cone-like mound well above the rim of the pot, to afford a greater surface for the roots, and in order that the water may pass away rapidly from the young shoots. The intermediate or Cattleya-house suits this plant well; it should have good exposure to light, but must be slightly shaded from the hottest sun. It does not appear to like being disturbed when thoroughly established, neither does it like being cut for propagating purposes. "*Orchid Album*," February.

MESOSPINDIUM VULCANICUM.

The locality in which this plant grows wild naturally points to its requiring cool treatment under cultivation, which renders it more valuable to those having but limited means, and at the same time being of dwarf habit it occupies but little space. We find it one of the earliest plants to grow, and that it thrives well associated with *Odontoglossums*, either in pots or hanging baskets; these must be thoroughly drained. The soil we use is a mixture of rough fibrous peat and live sphagnum moss, but the plant

should not be overburdened with soil, although it requires to be made firm. When growing this plant enjoys a liberal supply of water, and after growth is completed it must by no means be allowed to suffer from drought, but should be kept sufficiently moist to maintain the bulbs in a plump and healthy condition. The growing season commences just after the flowers have faded, and this is the best time to repot if necessary; but should the soil about its roots still remain in good condition, it will not be wise to disturb it. This species enjoys light, and delights in a free circulation of air if well charged with moisture; yet, like the *Odontoglossums*, it requires to be shaded during the hottest part of the day. Plants subjected to the above treatment will be found to grow vigorously—the exposure to the light will ripen the bulbs, and thus cause them to produce flower-spikes more freely; and these when expanded are so exceedingly beautiful, that they will be found to repay one for every care and attention which may have been bestowed upon them.

When desirable to increase the number of plants of this species, propagation may be effected by division just at the time the new growth appears—not less than two old bulbs being left at the back of the leading shoot. These divided species should be placed in small pots, using the same compost as that previously recommended; then put them in a shady part of the house until they begin to grow and new roots are formed, after which they may be treated as established plants. *Mesospindiums* are not very subject to the attacks of insects, but should they become infested these pests will soon injure the young growths if not speedily destroyed. "*Orchid Album*," February.

ANONECTM SANDERIANUM.

Amongst recently introduced Orchids this species certainly occupies a foremost place. It has been introduced from the Comoro Islands through the agency of Mr. F. Sander, at whose establishment at St. Albans it has lately been flowering in large quantities. In shape the leaves resemble those of *Phalenopsis violacea*, having also a similar light green colour. Reichenbach, in his description of the species in the *Gardeners' Chronicle* (p. 168), speaks of the largest leaf under his notice as being 4 inches long by 1½ to 1¾ inch wide; a plant in flower now at Kew has, however, leaves about twice as large.

The new plant carries three spikes, each bearing from twelve to fifteen flowers, which have the distinctive arrangement characteristic of *Angræcums* and measure 2 inches across the sepals; the spur is 3 inches long, and, like the rest of the flower, is pure white. Treatment in all respects similar to that usually given to *Phalenopsis* suits this Orchid perfectly, and it is one which all growers who are in a position to meet its requirements certainly ought to possess. *W. B.*

UNUSUAL GROWTH OF CALANTHE VEITCHII.

In the autumn mention was made in a contemporary of a curious growth of *Calanthe Veitchii*, which had occurred in the collection at Gunnersbury Park, and in others, including ours, the unusual occurrence consisting in the formation of the flower-spikes. In our plants the bulbs formed were larger than we usually have them, the largest being 15 inches in length—a result due to the tropical nature of the late summer, or to a more than ordinary liberal treatment afforded the plants, but probably each cause assisted in the increase of size. The flower-spikes came up of great strength, and in their early stage of growth led us to suspect they would turn out to be either sterile monostrophies or pseudobulbs; their bracts were unusually numerous and large, some of them equalling in size an ordinary leaf, while several inches at the base of the spikes were enlarged and fleshy—so much so, that it was anticipated some of them would break into growth. I have waited for this result—its further development—with much interest, and in two instances this has actually taken place. After the flowers faded the

spikes were cut back so far as the top of the swollen or fleshy portion; this in one case is 5 inches in length and about 1½ inch in diameter, being in shape and appearance like a true pseudobulb. The pseudobulbs from which these unnatural growths issued are each forming two growths independent of those upon the flower-spikes. *T. C.*

CALANTHES.

Being desirous of increasing the number of our plants of *C. Veitchii*, we break the bulbs asunder at the point where they are sometimes contracted—a practice some may be inclined to condemn, yet it is a means to an end, and does not appear in any way to impair the vitality of the remaining portion of the bulbs, as they make growths equal in strength, and flower as freely as do other bulbs which are not so treated. Pieces of the pseudobulb if detached soon after the flowering season, and laid upon a shelf in a stove will in time produce buds and roots, and should these be potted in the usual manner, and properly attended to afterwards, will blossom the first season. *Thomas Coomber.*

A PROLIFIC ODONTOGLOSSUM.

At Messrs. Thomson & Son's nurseries, Clouvenfords, N.B., there is to be seen a plant of *Odontoglossum Pescatorei* with nine growths issuing from a pseudobulb—not small crippled growths, but healthy and well developed. It is fortunate for the owner that this plant is one of the finest varieties known, Mr. Thomson having in view the subdivision of the plant, and with that object he has carefully removed the flower-spikes, so that a more rapid development of growth may be induced; and there is no doubt that the extraordinary number of "breaks" are in a measure due to the cutting off of the blossoms as soon as they had pushed clear of the leaf-sheaths. It would be interesting to know if anyone else has ever seen so many growths from a single pseudobulb. *J. G.*

CHRISTMAS ROSE CULTURE.

THERE is probably no hardy perennial in cultivation which so well repays liberal culture, and, at the same time, no plants so soon resent all attempts to grow them in shallow or poor soils; upon this point there hardly seem two opinions. Those who carefully prepare a spot for their reception certainly deserve success; and as regards the plants afterwards, I would say leave them undisturbed for years—so long as they continue in full vigour, and neither flower nor foliage appear in any way to have exhausted the material about their roots. Such things as these—the best floral ornaments any garden can contain in mid-winter—no amateur, or professional grower, will care to disturb.

I most fully agree with Mr. Brockbank (p. 199), as to the depth of soil and well prepared bed, and can imagine what a sight the plants would be, from some couple of dozen or more clumps I had under my care some years ago, and which were treated somewhat similarly. The grandeur of these plants—all the major form of niger, each about 2½ feet across, with numbers of white blossoms—still remains as fresh as ever in my memory. Two of these monsters spread their leaves out upon the turf in such a dense mass as quite to kill the grass; and from this a false step was decided on.

My employer and myself were agreed that no harm could befall these plants if they were carefully lifted with a huge ball of earth, and planted immediately; but we were wrong. Having decided that these clumps should occupy a bed about 12 feet from their original position, a huge hole was got out in readiness, fully 3 feet deep and about 2½ feet across. The old soil was replaced by roughly chopped peat, excellent yellow loam from Bantstead Downs, decayed manure, leaf-soil, and an abundance of sharp grit; and, having put some into the hole, we started to lift the first plant, which was no small matter. By digging deeply round it on three sides, and clearing out the soil, we were

enabled to get behind it and lever it on its side, and thus remove it. To all appearance the operation could not have been done better, and this fine clump was safely deposited in its new home, and the second clump likewise. The operation was performed in early autumn. In the result, notwithstanding that every attention was given it, with occasional sprinklings overhead, and a thorough watering at planting time, this specimen, for which such careful preparation was made, soon lost every leaf, and not a flower attempted to issue from the numerous crowns—it bore evidences of a rapid decline, one plant in particular being affected; the other did not lose so much foliage, but was considerably weakened; so much so, that after a season both were taken up and divided, only to find a great portion of the roots had made little or no attempt to start afresh.

What might have been done to have prevented this loss we discovered when the mischief was done, as by increasing the size of the bed, the plants would have been saved; I am also of opinion that had we carefully divided the large plants our loss would have ended in the flowers of that season alone, and we should have been the gainers in plants eventually.

Mr. Brockbank appears to have had a similar experience with his Devonshire clump, which, however, suffered in a less degree. Both cases, however, point to the one conclusion, that it is a mistake to transplant these large clumps intact. The matter is clearer when we consider that from the crown, or starting point, of the new leaf made in early spring, fresh roots are emitted in the early autumn; these are the large fleshy roots, which I regard as of the greatest importance, and which should always be preserved. The "rootlets" to which Mr. Brockbank refers as being formed after flowering in February, I take to be the fibres from the main roots, the fibres continuing to be formed for some time; and from the fact of these large fleshy roots being made in the autumn, I have urged that plantings should be made before these are emitted. In this way both these and the fibres formed in spring would be preserved intact, much to the benefit of the plant. Does Mr. Brockbank's experience in any way agree with mine as to the time these roots are formed?

There is a wide difference between transplanting and dividing home-grown plants in one's own garden and obtain them from a nurseryman, or relying upon the imported roots. In the first place all may be done in a few hours, and very little injury sustained. The best way to send them from a nursery is to shake off the soil, tie the roots in a piece of old sacking, then dip the roots, sacking and all, into the water-tank, and allow them to drain before packing; in this way the roots arrive plump and fresh.

Another question worthy of consideration in planting *Hellebores* is in regard to season. With such a home as they would find at Brockhurst in store for them, I should imagine they would do well planted at almost any time. But with the dry spring and summer of the past three years, February or March planted specimens have not time to take hold of the soil; and in cases like my own, with a deep gravelly subsoil, and the soil dust-dry for months, they stand but a poor chance indeed; yet this appears to affect the Christmas Roses in a much greater degree than the Lenten Roses, many varieties of which I planted early last spring, which soon recovered, and have made fine plants. There are several points connected with imported *Hellebores* which tell heavily against their recovery. They are these:—Consignments come to hand with roots only 2 inches long, or less; the leaves, stalk and all, cut off shortly likewise; frequently the roots are very much blackened in transit, in which case they invariably perish; these roots are also cut off, judging by the time we receive them, at the moment the new main roots are issuing from the crown. I have noticed this particularly and frequently. Thus the plant, shorn of leafage and roots, can hardly be expected to exist; an improved system of packing appears necessary, and I consider the foliage should always remain intact.

Sometimes they are packed in sawdust—a system strongly to be condemned, for sawdust appears to hasten decay as soon as it comes in contact with the soil. Could I have my choice as to the date of receiving imported *Hellebores*, I should unhesitatingly say the first week in September, packed in their own foliage and a little green moss, and shipped by the quickest possible route. I received a batch about this time—*i.e.*, September—last year, which were in good condition, though small; the losses I do not estimate at more than 1 per cent., for all have flowered and pushed forth those main roots the appearance of which I always hail with delight, particularly in the case of foreign plants.

It is not for the nurseryman to be able to form beds 3 feet deep of soil with sandstone blocks, but all amateurs who covet success with these plants cannot do better than closely follow the system adopted by Mr. Brockbank, and which he has so clearly set forth, remembering not the trifling cost at the start, but rather looking forward to the results of well considered work.

I should have said that in dividing old plants, no matter how large they are, I never use a knife, nor do I wash them out, but I shake the soil well away from them, and divide with two small hand-forks placed back to back, piercing the woody rootstock with one tine of each fork, and then pressing in an outward direction round the plant asunder in a remarkably easy manner, which may be repeated till the plants are of the required size. I have adopted this plan for some years for these and other things—*Funkias*, for example—with the same results. *E. Jenkins.*

PLANT DISEASES.

SMUT ON CORN.

At a recent meeting of the Klub der Landwirthe at Berlin, Professor Brefeld, of Münster, spoke on the fungi which cause the blackening of our corn and other graminaceous plants. The plants attacked by this disease are easy to recognise by the black powder (smut), which is to be found in some organs of the affected plant; such as the leaves, stamens, and the pistil. This powder consists of propagating cells, spores, which endure the rough vicissitudes of the winter season, and consequently are named resting spores. The disease is transferred by them the next spring to other plants. That this is the case was shown a long time since by various authorities, who had observed the method of germination of the spores, and the entrance of the germinating tubes (the mycelium) into the plants. It is the especial merit of Professor Brefeld to have proved by long years of observation and by tedious studies, that there exist interruptions in the life-history of these fungi, formerly quite unknown. He was enabled to obtain this knowledge by cultivating the fungi in nutritive solutions. The germination of the spores in water has already been observed, when they formed after a short time "sporidia," which grow out again as short tubes. Brefeld showed that the growth of the fungi is quite different if, instead of water, they are grown in an artificial nutritive solution. In this case the tubes form sporidia in unlimited number, forming the so-called barn (yeast, Hefe.) After carrying out these experiments Brefeld cultivated the spores on natural nutritive substrata, as dry manure, and observed precisely the same growth as in the artificial nutritive solutions. The result of these experiments is, that the blight-forming fungi may grow elsewhere than on the host plants. Now it is interesting to see that these fungi cannot attain that state of growth which ends with the formation of resting spores beyond the plant. So it was essential to inquire if from the sporidia in the barn state formed outside the plant, the blight may be formed within the plant.

For this purpose Brefeld infected plants of Oats (*Avena*), Maize (*Zea*), and Millet (*Panicum*) in the

different states of growth by means of a spray apparatus with the sporidia (barm state). The result was, that of the plants of the Oats in the first germinating state 16 per cent. were affected, whilst in the next growing state only 1—2 per cent., and later on no plants at all became infected. The highest percentage of plants infected with the sporidia (barm state), when the seeds germinated in a mixture of soil and manure, was 44 per cent. This result shows that the disease is carried by the manure applied to the fields. On the other hand, these experiments show that the plants can be infected by fungi only when the latter are in the earliest stages of growth, especially in the first germinating state; that they are harmless in the later states of growth. Even if the sporidia are placed on the young apex of the older plant no infection will follow. They grow out and enter the plant, but they cannot grow further, as they cannot reach the growing point where the panicle is formed, and it is only in the panicle of these plants that the fungus forms its resting spores. But when the sporidia come in the young plants somewhat over the hypocotyledonous node in the interior of the plants, they grow together with the axis. The plant grows as a perfectly sound one; there is nothing to indicate that it is attacked by the fungus until after four months the blight appears in the panicle. Similar results were found by Brefeld in Millet. But in the case of the Maize he found that all young parts of these plants during the whole period of growth can be infested by the disease, and that a short time after infection these parts appear blighted; but the fungus does not grow into the interior tissues of the plant, so that these remain quite healthy.

The blight of Barley (*Hordeum*) was formerly supposed to be identical with that of Oats, but Brefeld found that the Barley cannot be infested by the sporidia from the Oat, and that the blight of the former has species quite distinct from those of the Oat. The investigations on this matter are not yet concluded.

To these interesting communications Professor Frank (Berlin) remarked that if the young plants of Oat and Millet are infested by the resting spores of the manure, it would be quite useless to soak the corn in blue vitriol or sulphuric acid (H_2SO_4), by which the resting spores of the disease are killed. But he thinks that the results of his investigations prove that the risk is not so large as might be inferred from those made by Brefeld, as he found, that by different causes, such, for instance, as Bacteria, want of sugar and other carbo-hydrates—the growth of the fungus on natural substrata is rendered difficult. Professor Brefeld controverted these objections, but declared that the soaking of the corn in blue vitriol was an excellent preventive against infection, the more so as some of the blue vitriol of the soaked grains is dispersed by the act of germinating to those places where the fungus makes an entrance into the young plant; and also that blue vitriol is one of the most destructive poisons to spores of fungi. In conclusion Professor Brefeld remarked, that the spores of blight fungi remain alive for ten years, whilst in the barm-state of the fungus, the spordia, disappear after four weeks. *Dammer.*

FOREIGN PRODUCTS.

MEXICAN FIBRE.

In the December number of the *Kew Bulletin* it is shown that the botanical source of the Mexican fibre or Istle, now so much used for brush-making, is *Agave heteracantha*. Now that its botanical origin is cleared up some few notes on the history of its introduction into this country and the development of its uses may be interesting. As with the introduction of Piassaba and Kiltoo, so with that of Mexican fibre, we are indebted to Mr. Arthur Robottom, whose attention seems to have been first drawn to it so long back as the period of the Russian War, when the Istle or Mexican fibre was proposed as a substitute for Russian Hemp. A small trial shipment was sent to England from Tampico. It was soon found to be too stiff as a substitute either for Hemp, Jute, or Macilla, but it was thought it might prove useful for brush-making

in place of bristles. About the same time it appeared as a new introduction in New York. A demand, however, having sprung up for it amongst the brushmakers here, orders were at once despatched to New York to buy up all that was on sale in that market. Soon after this, however, it was announced that 20 tons had been shipped from New York to the Continent, and this was traced by Mr. Robottom to Hamburg, where it had been offered to the ropemakers, but not being found suitable, the whole was purchased and sent on to London. Mr. Robottom says:—"The first arrival sold at £28 per ton, it then rose to £85 per ton, and then from this price it came down to £18 per ton, and afterwards, at the time of the insurrection in Mexico, it again rose to £140 per ton. The trade increased very rapidly, and as few people knew anything of its origin, I made up my mind to go out to Mexico and see for myself how it was collected and brought down to the seaboard. I arrived off the small port of Tampico in one of the West Indian steamers, and engaged a boat to take me up the river to the town, which is about 8 miles from the anchorage grounds. On my arrival in the town I found no one who could or would give me any information of the kind of plant that produced the fibre, or how the fibre was obtained from the plant, but noticing that large numbers of mules were coming into the town with Istle, I at once determined to take a journey inland, to find out the source of supply." Arriving at the *Plane de Armarve*, which is a small Mexican town in the centre of the Istle-producing country, Mr. Robottom thus describes his experiences:—"We put up at the house of the head-man of the country, who kept an *almacen* to supply the people with various articles, and he also employed above 370 peons gathering the Istle. Next day we arranged for a ride to see the men collect the Istle, and I must admit that I was never more astonished than at the great simplicity of the method for preparing the fibre. The plant is a species of the *Aloe* tribe, but quite different from the *Agave americana* or *Pulque* plant, but somewhat resembles the *Yucca*. It is about 2 or 3 feet high, and out of the centre of the plant grows a flower from 6 to 7 feet in height. The natives cut the flower-spike out, peel it, and use the stalk for a vegetable. The following is the simple mode of collecting the fibre:—The natives provide a stick about the size of a broom-handle, and place a leather thong at the end, something like the thong of a hunting-whip. The men place the thong or loop down the leaf of the plant, twist it round, and pull it out of the plant. The leaves have a row of thorns down each side, which are very sharp; the leaf is then passed over to another man, who is seated near a small tree; he places the leaf on a long board, and then pulls it with his left hand underneath a loose rough knife, the end of which is fixed in the root of the small tree before mentioned. After pulling the leaf through in this way several times the pulpy or flossy part is separated from the fibres, and a small handful of the fibre is then obtained. This is put in the sun to dry, which takes only about fifteen minutes; every two men collect from 20 to 40 lb. of fibre per day. It is then carried to the master who has engaged these persons, packed in bundles of about 140 lb.; two bundles are put across each mule and despatched to Tampico—about fourteen days' journey. . . . After the arrival of the Istle in Tampico it is sold and packed in pressed bales of about 400 lb., shipped to England and New York, and again sold to the brushmakers and fibre-dressers. It is used either mixed or alone in nearly every kind of brush, but its principal use is for making scrubbing and nail-brushes, whitewash-brushes, deck-scrubs, &c. The soap-brush used in Turkish baths in this country is made of this fibre, known by the name of "Liffe." Mexican fibre is quite unsuited for sweeping-brooms, and should never be used for such a purpose. At one time Mexican fibre was largely used by crinoline makers as imitation horse-hair, and when first introduced into this country it was used for mixing with horse-hair for stuffing mattresses, chairs, &c. A large trade exists in the manufacture of brushes

from this fibre in Germany, France, Holland, Denmark, and North America; while the principal labour employed in England in connection with the industry is in drawing and combing the fibre and arranging it in suitable lengths for the brushmakers. The bulk of this work is carried on in London, Birmingham, Manchester, and Sheffield, where it is prepared for the English market, as well as for exportation to the Continent, Australia, and other parts of the world. *John R. Jackson, Museums, Kew.*

COLONIAL NOTES.

CEYLON.

Dr. TRIMEN has rendered good service by the publication of a classified list of the plants, both native and exotic, growing in the Royal Botanic Gardens, *Péradeniya*, Ceylon, the two categories of plants being carefully distinguished. The catalogue is arranged after the sequence adopted by Bentham and Hooker. Very few synonyms are added, but the Sinhalese and other vernacular names are appended. An alphabetical index of genera is also supplied. No numerical lists are given, but the catalogue comprises no fewer than 120 pages, with, at a rough computation, twenty species in each at least, so that not far short of 3000 species must be comprised in the garden record.

BOTANIC GARDENS, KING WILLIAM'S TOWN.

The financial position of these gardens has greatly improved, owing to the increased amount received from the sale of trees, plants, seeds, &c., a source of revenue which, however desirable as a temporary expedient, is not one likely to contribute to the permanent utility of the gardens and the development of the botanical resources of the country. The services of Mr. Leighton, the Curator, are handsomely acknowledged. The first spring show of the colony was held in the gardens in October.

CULTURAL MEMORANDA.

CLIANTHUS DAMPIERI.

THIS Australian Pea is a capital plant wherewith to cover a trellis or wall in a greenhouse, the scarlet and black flowers being very effectively contrasted with its Fern-like foliage of a pale green colour. The seeds will germinate quicker if they are soaked for a few hours in warm water before being sown. Many fail to grow this plant through sowing several seeds in one pot, and afterwards potting the seedlings singly, and subjecting them to frequent shifts from the small 60's into the flowering pot when grown as a pot plant coiled round a trellis, as by so doing the roots get broken, consequently the plants seldom come away kindly afterwards. Therefore, the seeds should be sown singly in small pots in light sandy soil, and as soon as the little plants have made 2 or 3 inches of growth they should be shifted into $7\frac{1}{2}$ inch pots, while thoroughly moist at the roots, taking care not to injure the latter in any way in the process of potting. Use a compost of four parts fibry loam and one of leaf-mould and pulverised horse-droppings, with a good dash of drift sand added. Then put the plants in a close pit near the glass for a few weeks until the roots have taken to the fresh soil, and be very careful in giving water at the roots until the latter have pushed well into the soil, then using ordinary care in its application. From this size pots the plants should be either planted out on a raised border, having good drainage, in the greenhouse or conservatory, or transferred to their flowering pots. In either case the plants must be kept well syringed overhead during the summer months, otherwise they will become infested with red-spider.

POINSETTIA FULCHERRIMA.

Plants of this decorative subject, which have been at rest the past two months, should now be cut back

a little, the surface of the soil in which they are growing loosened prior to giving sufficient tepid-water at the roots to moisten the ball of earth, and then be placed in heat, syringing them overhead morning and afternoon to induce the plants to push into growth, which, thus treated, they will do in due time. The young growths, when between 2 and 3 inches long, should be taken off with a heel of the old wood and inserted singly in properly crocked small pots filled with fine sandy loam three parts, and one of leaf-mould, having a surfacing of silver-sand, which in the process of putting in the cuttings will fall to the base of the latter. The pots should then be plunged to the rim in a brisk bottom-heat, the cuttings damped overhead through a fine rose to settle the soil about the cuttings, and be shaded from sunshine until rooted, which, if kept close, they will be within three weeks afterwards. Before the roots become matted in the pots shifting into 4½-inch pots should take place, putting them in heat near to the glass, and keeping the plants close for a few days until the root-growth recommences, when more liberal ventilation should be adopted. In due time all the strong plants should be shifted into 6-inch pots, their final shift for the season, but keeping the weakest plants in the 4½'s; and these, as well as the larger plants, will prove of much value for furnishing purposes next winter. During the season of growth, and after the roots have filled the pots, a pinch of Beeson's, Clay's, or Standen's manure strewn over the soil two or three times a week before giving water at the roots will give added vigour to growth. During the summer months the plants may be grown in a cold pit having a southern aspect, damping them overhead at shutting-up time early in the afternoon until they have grown to the desired size, when they should be plentifully ventilated by degrees, so that the wood may become thoroughly ripened before placing the plants in a warm house at the end of September. If a few of the best of the old plants are shaken out after the cuttings have been taken off and repotted, and grown on in heat for a few weeks, and subsequently in cold pits, they will form good subjects from which to cut. *H. W. Ward.*

FORESTRY.

TREES FOR CHALKY SOILS.

Handwoods.—Amongst these the Beech occupies the front rank as a tree that is peculiarly well suited for planting in chalky districts, for it will grow and produce a large quantity of timber where but a few inches of loam overlie the chalk, a fact that is strikingly exemplified in the park at Holwood, where numerous trees, containing fully 200 feet of wood, and with stems girthing from 8 feet to over 20 feet, may be seen. It is a strange fact, but nevertheless a true one, that in order to find out where the chalk beds run, one has only to be guided by the line traced out by the largest and most luxuriant-growing Beeches. As to the advisability of planting the Beech on pure chalk rock, or where no surface soil is present, we could not think of such, at least, if the greatest production of timber was a matter of first importance. The Beech will no doubt grow well enough on almost pure chalk; but where we have noticed it doing best—attaining to the largest size, and producing the cleanest wood—is where a quantity of loam, say from 1 foot to 3 feet in depth, overlies the chalk, or is incorporated with it.

In several instances that have come under our own notice lately, but particularly in the stubbing out of old field boundaries, this was the only hard-wood tree that could be said to have attained to anything like a respectable size of the many kinds either natural or that had been planted; but then it is likewise well to add that in some parts the chalk cropped through the surface, while no part had a greater depth of loam or clay overlying the chalk than 3 or 4 inches. Whether or not the timber of the Beech grown on chalk is of better quality than that produced on other soils we are not at present in a position to state, but we would fancy that it is, and information on this point would be of some

value from those who have had the chance of observing.

The *Norway Maple* (*Acer platanoides*) actually revels in a chalky soil, as do also *A. colchicum rubrum*, both of which are handsome, hardy, large growing trees, and particularly well suited for extensive planting as forest trees under certain conditions of soil in this country. The Maples, it must be borne in mind, are not placed second on our list of chalk-loving trees as being preferable to any others for planting on such soil, for there are no doubt equally valuable subjects treated of further on. Every one who has seen a well developed specimen of the *Norway Maple* must admit that, in beauty of foliage at least, it has few rivals amongst our commonly cultivated forest trees; and the same may be said of the red-twigged form, *A. colchicum rubrum*.

The *White Poplar* (*Populus alba*) is an excellent tree for planting in chalky districts, indeed it is somewhat surprising to see to what an immense size it attains in some of the Kentish estates and on almost pure chalk. But it is by no means a fastidious tree, for it will grow well almost anywhere, be the soil rich or poor, damp or dry. To-day we measured one of several specimens that caught our eye in a woodland here, and where the soil is a poor chalky loam resting on rough gravel. It was fully 76 feet in height, girthed at 3 feet and 5 feet, 8 feet 10 inches, and 8 feet 9 inches, and contained 97 cubic feet of wood. Where but little soil covers the chalk the *White Poplar* does not, however, attain to so large dimensions as where there is a depth of 2 feet or so; but for all this it will grow to a fair size even on the parched chalk rocks, and where hardly a particle of soil is to be seen. Other *Poplars* that do almost equally well on the chalk formation are *P. monilifera* and *P. canadensis*, both excellent hardy and free-growing trees.

Elms, particularly the *Huntingdon* and the *American*, have few equals amongst chalk-loving trees, for both grow rapidly and attain to a large size where but a small quantity of loam is present in the chalk. The *Scotch Elm* needs no coddling to make it start away in chalky districts, and we were not a little surprised some days ago to notice it growing freely on the side of a chalk pit, and where only about 7 inches of gravelly loam occupied the surface. One of its companions here was as healthy and bright looking a specimen of the *Yew* as we have ever beheld, and sorry were we to have omitted making mention of this tree when treating of "Conifers for Chalky Soils."

The *Lime* should find a prominent place amongst the trees used for planting where chalk abounds in the soil, for in such it grows very freely, and attains to a large size. In planting the *Lime* in such it is well to mix up with the chalk a small quantity of loam, this inducing a free start to growth, after which it matters little whether the roots come in contact with pure chalk or not.

False Acacia (*Robinia Pseudacacia*).—In this will be found an excellent tree for planting in chalk soils, and the size to which it attains in such is greater than on almost any other, even the finest and richest of loam—that is, in this country. On the *Holwood* estate are numerous specimens of large size, one in particular being 14 feet 10 inches in girth of stem at a yard from the ground, and containing 110 feet of wood. As an ornamental tree the *False Acacia* is certainly well worthy of attention; indeed few prettier sights in the floral line have we seen than a 60-foot high tree covered with its bright rosy flowers; but we are now referring to the form *Decaisneana*, and which is perhaps the best of the "101" forms into which the *Acacia* has been divided.

The *Alder* and *Birch* thrive with remarkable vigour on chalky soils, indeed it is not too much to say that amongst hard woods they have few equals for planting in such soils. It may seem strange, but it is nevertheless true, that most trees which in a state of Nature grow in damp, nay, even marshy soils, are well suited for planting where chalk and little else is the main component part of the soil, and this is explained as follows:—Chalk, although sufficiently porous to allow water to percolate through it, has, like all other calcareous matter, a strong attraction for water, and thus acts like a sponge in holding it in considerable quantity and for a very long time; and thus it is a rare occurrence for the herbage of the chalk downs to be burned up even during excessively hot and dry summers. The *Alder* is very largely grown in the southern English counties for *Hop-poles*, but particularly in *Keat*, and we have more than once been surprised at its luxuriant growth on the warm chalk drifts. *A. D. Webster.*

PLANTS AND THEIR CULTURE.

SOLANUM CAPSICASTRUM.—These may be cut down as they become shabby, putting in the best of the tops as cuttings, which soon form roots and which will, with ordinary care, make handsome little plants by the autumn. The old plants, if cut back very hard, and stood in a moist pit, will break freely from the old wood, when they should be taken out of their pots, and repotted in those of a smaller size, to be potted later in the season, or if in warm parts of the country, planted out on a warm border in good loam, a soil which suits them best.

Roses.—The rest of the *Roses* in pots should now be started into growth. If hybrid perpetuals were potted up in the autumn, it is a good time to start them, when a nice crop of flowers may reasonably be looked for. Should the stock of plants have run short, plants of the following sorts, if procured at once, would come in at a good time of the season:—*Adam*, *Isabella Sprunt*, *Madame Falcot*, *Safrano*, *Souvenir de la Malmaison*, *Niphetos*, and *Mrs. Bosanquet*, the buds of which are much appreciated. The two great pests in *Rose* growing are greenfly and mildew, neither of which will occasion much trouble if measures be taken in time. The first is easily disposed of by the application of some liquid insecticide, which is much more effectual if the plants have been slightly fumigated the night previous to the application. If the operation has been thoroughly done, the plants will be completely cleansed for some time longer. As to mildew "prevention is better than cure," therefore make sure that there are no spores of the fungus about the plants when they are brought into the house, and as a precaution remove the surface soil from the pots, and wash the plants well, re-surfacing with fresh soil. A stagnant atmosphere is a prolific source of mildew, especially if the temperature be kept at about 55°, those being conditions favourable to the development of the fungus. Maintain therefore a buoyant air in the house, and should mildew appear apply flowers of sulphur, or any of the solutions of sulphur now manufactured for the purpose. All plants showing flower should be assisted by liquid manure—nitrate of potash (saltpetre) is a fine stimulant for *Roses*—about half an ounce to 1½ gal. of water will be strong enough, and should the weather be fine periodical syringings are beneficial, but be sure that the foliage gets dry before nightfall.

Cool Pits.—Plants of *Sweet Scabious* (*Scabiosa atropurpurea*) and *Schizanthus pinnatus*, which have been wintering in these pits, should now be seen to, going through them, cleaning the surface of the soil in the pots, and removing any withered or decayed leaves. Should it be desirable to bring on some of them on a little faster, these may be put into a warm greenhouse; but anything approaching to forcing must be avoided, or it will spoil them. If the supply is likely to run short of the demand, a pinch of seeds of *Schizanthus*, sown at the present time, would come in usefully towards the end of April or beginning of May. The elegantly cut foliage, and curiously marked and finely cut flowers of these plants, render them always objects of admiration. They are of easy culture, and any fairly rich, light soil will suit them. In all stages of their growth they must be placed well up to the light, and plenty of ventilation supplied to prevent weak growth. The varieties best to grow besides *pinnatus* and its varieties are *S. Grahami* and *S. G. retusus*: these are dwarfier and darker in color.

Hard-wooded Plants.—*Correas* and *Croweas* now starting into growth and requiring to be repotted should receive attention. The soil best suited for them is fibrous peat—not the spongy brown sort—with a good sprinkling of coarse silver-sand added to it, to keep the mass porous. If peat of the kind indicated be not at hand, the compost would be improved by the addition of some light friable loam. The pots ought to be provided with ample drainage, and the new soil around the old ball made quite as firm as the latter, which should be fairly moist at the time of potting, or it will be almost impossible to thoroughly moisten it afterwards. Let good space be left for watering, but be careful not to bury up the collar of the plant; and if it is loose, insert a short stout stick to keep it firmly in position. This, with occasional pinchings, should be the only support required to keep the plants in good shape. After potting stand the plants on a moist surface in an airy greenhouse, but avoiding draughty corners.

Aphelexis, *Dracophyllums*, and *Phœnocomas* require a similar soil and treatment, but the two first-

mentioned, being trailing shrubs, require more attention as to staking to bring them into a good form, but avoid using any more sticks than are needed to give outline to them, and let the outside row lean well outwards, disposing of the others thickly throughout the head of the plant. Any further support that may be needed will consist of looping up the braoches to each other, which, in most instances, looks much better than numerous sticks. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

ROSES.—The leading buds of these are now pushing into growth so rapidly that any pruning which requires to be done should not be further delayed, *i.e.*, with established plants. No hard-and-fast rule can be laid down as being applicable to all sections, but each plant or variety must be treated on its own merits, and in accordance with its vigour and habit. Speaking generally, however, those of weak or moderate growth should be cut back more closely than those of more robust growth. Standards and dwarfs of H.P.'s may be taken in hand first, cutting out all dead wood, and suckers where they exist, as well as all spindly shoots; those which are left to be thinned out where overcrowded, and the remainder shortened back to three or four eyes each—growths of medium strength and more vigour may be left a little longer. Excessively strong pithy shoots should be cut back to their base, as they invariably do more harm than good when allowed to remain on the plants. Beds of Noisettes, and Tea-scented Roses should have any light protection they may have had removed forthwith, and be pruned towards the end of the month. In doing so, leave two or three eyes more on each shoot than was done with H.P.'s. In cold districts it is still advisable to afford protection for two or three weeks longer, sheltering them from cold winds by means of hurdles made of Spruce or Laurel branches; and in some localities it may be necessary, on account of the weather, to continue the winter protection to a later period. Roses against walls, and notably such strong growers as *Maréchal Niel*, *Devoniensis*, and *Charles Lawson*, ought not to be spurred back too closely, and if quantity rather than quality of bloom be wanted, the most vigorous shoots of last year, if well ripened, should be simply shortened back a little, leaving them quite two-thirds their length. Any planting that has to be done should be completed with speed, deferring the pruning of the plants till later.

GLADIOLUS.—The ground for these plants, when grown in beds, should have been prepared in November by manuring and trenching; and when it is in a sufficiently dry state the general stock may be planted out at a distance of 1 foot apart and 4 inches deep, surrounding each corm with a little sharp sand. In mixed herbaceous borders it is always best before planting the *Gladiolus* to take out two or three spadefuls of earth and replace it with sound loam and rotten cow-dung or leaf-mould, the position of the roots to be indicated with a label or a stick. Those that were set in pots a few weeks since should be planted out before getting potbound.

Miscellaneous.—In some districts unpropitious weather will doubtless have delayed one or two operations touched upon in previous Calendars; in such cases bring up arrears of work as soon as practicable. Under favourable conditions the transplanting of autumn-sown *Antirrhinum* and *Sweet Williams* from seed-beds to where they are intended to flower should now be done. *J. Horsfield, Heytesbury.*

FRUITS UNDER GLASS.

PINES.—Fruits developed during the winter will now be colouring. It will be advisable where there are a few only to remove any of them which are in this stage to a drier atmosphere. The *Queens*, which were recommended for special treatment at the beginning of the year, should now be making rapid progress, and it will be necessary to remove all galls *i.e.*, (suckers) from around the crown and base of the fruit as soon as possible; reduce also the number of suckers on each plant to one or two of

the best. The best method of dealing with needless suckers is to twist them out, for, if they are cut off, they are apt to grow again. See that the plants do not want for water at the root, and at the same time guard against a too wet state of the soil. Instead of periodical indiscriminate waterings, let each plant be examined, and sufficient weak manure-water afforded to moisten the whole ball. The late cold, boisterous weather will have rendered the maintenance of the necessary temperature impossible without excessive firing, but for the month of April let 75° for mild, and 70° for cold, nights, be the maximum; guard against having too strong a heat in the pipes when there is a prospect of a sunny day, otherwise the pinery will be robbed of its moisture; and, on the other hand, the weather during April is generally so uncertain, that it is not safe to let the heat wholly down during the early part of the day; it is therefore necessary to exercise much discrimination in the matter.

The fires may be started in good time during the afternoon to prevent a too rapid subsidence of the temperature due to sun-heat below 95° at shutting-up time. During bright weather the plants may be slightly dewed over at shutting-up time every other day. This should not be done so heavily as to cause water to lodge amongst the leaves in greater quantity than the sun and heat of the house will evaporate during the day. A watchful eye must be kept on the state of the bottom-heat, to prevent the temperature exceeding 95°, especially where it has been necessary to renew the materials of the beds to any extent, and when greater heat threatens let the pots be raised a little to allow of a clear space of an inch all round for the escape of heat.

Succession Pines.—Succession Pines will now be making free growth, and may be shut up with a temperature of 85° to 90°, well damping floors, walls, &c., but it is better not to syringe the plants freely as yet, but if the weather be very bright a slight dewing over with a fine rose pot, or syringe twice a week will be nuple. Let the temperature gradually decline to 65° for cold and 70° for mild nights at 10 p.m. During fine weather ventilate freely, and, where the glass is of inferior quality, or the squares are of large dimensions, it will be necessary to employ some light movable shading during the brightest part of the day, to prevent the foliage browning, and the leaves having holes burnt in them by the lenses found in the glass. The shading must not be of such close texture as to exclude the sun's rays, or the plants will become drawn; netting with 3-16 inch mesh will be found suitable for the purpose. Let careful attention be given to the watering of successions, the plants not being pot-bound, affording too much water will result in yellow, unhealthy foliage of poor substance. Continue to put in suckers, and pot on any such which are well rooted before they become cramped in the pot.

Vines.—The fruit on plants in pots will now be colouring rapidly, and more air should be admitted, and a cooler, drier temperature maintained, but all draughts must be avoided, or this would result in injury to the foliage. The use of manure-water must be discontinued, and only sufficient rain-water given to maintain the Vines in health. Permanent Vines are liable to attacks of red-spider at the periods of colouring and stoning; in the former case the pipes may be painted with flowers of sulphur, and be made sufficiently warm to disperse the fumes; in the latter case the situation is more critical, as it is not safe to apply sulphur fumes without risk of injuring the tender skin of the fruit. Spider generally appears at the warmest end or the front of the house, but if it be taken in time there is no difficulty in preventing its affecting much of the foliage; hand-sponging with soft-water and a little soft-soap is the safest and most effectual mode of getting rid of the pest. Muscats coming into bloom should receive a temperature of 75° at night and 85° by day, the atmosphere to be kept dryish, admitting abundance of air on all favourable occasions, but guarding against cold draughts of air. If the stems of the Vines are tapped daily it will disperse the pollen, or a Pampas-grass plume may be drawn over such free setters as Hamburgs when in bloom and then shaken about in the house. After the bunches are set give the Vines a syringing once, and gradually allow the temperature to subside to 65° for cold and 70° for mild nights. As soon as the fruits are set give every attention to watering the borders, not only inside but outside as well, as the covering which was placed over the outside borders about the end of the year, will have prevented any large quantity of moisture from entering the soil, and during the summer of last year there was not too much water at

hand to bestow on outside borders. Attend to the thinning of succession Vines in their earliest stages. This requires great care and discernment. The berries should have sufficient room to swell without pressing against each other, and on the other hand they must not be so over-thinned that the bunch when laid on a dish will lose its compact shape. A calculation should be made during the thinning as to the probable diameter of the berries when fully matured; I find that with such large-berried varieties as *Gros Colmar* the berries are quite close enough at 1 to 1½ inch, Hamburgs at ¾ inch, while small sized Grapes like *Sweetwaters* may stand at ½ inch apart. See to the timely disbudbing of late Vines, and when the shoots have attained 1 inch in length keep the night temperature at 55° with fire-heat. Rub off all the superfluous buds from young Vines as fast as they break, but on the stem below the wires retain some shoots at distances of a foot apart up the stem, to be pinched back to two leaves, and by this means to secure the due enlargement of the stem, about this part. *W. M. Bailie, Luton Ho.*

THE KITCHEN GARDEN.

In warm positions Potato planting may now be commenced in suitable weather, if the soil be sufficiently workable. Early varieties, including the *Ashleaf* section, are much benefited if the ground can be afforded a good dressing of decayed leaf-mould, and generally are benefited by a lighter and richer soil than is needed for the later varieties. In gardens that are naturally cold and much exposed it is best to plant the late varieties first, these being much longer in starting into growth than earlier, and not to plant the bulk of the latter before the middle of the month of April, and which are then ready for use almost as soon as if they were planted a fortnight earlier, as well as being much safer. The late varieties are usually grown outside the kitchen garden, and are, generally speaking, the best when planted on land that has not been manured recently; the finest crops are grown on broken up grass-land or woodland, provided the soil be not of a very heavy nature. In order to have them of good table quality the land should be well drained; a sloping piece of ground inclining to be sandy in its nature will generally grow the best Potatoes, and is much to be preferred to flat land or heavy soils. If manure be considered necessary preference should be given to manures rich in potash instead of to farm-yard dung, which induces too strong growth and large tubers. The quality of the different varieties varies very much according to soil and situation. Here on a shallow limestone soil which is poor and rather heavy we find *Magnum Bonum* uniformly of good quality, and it crops well; whilst 6 miles off, on soil overlying the red sandstone formation it proves almost a failure. *Snowdrop* is another variety which does well here for mid-season use, but it is not so good on the red sandstone; and similar instances of partial failure often occur—but generally speaking the mid-season varieties can be rather more depended upon in unfavourable localities than the kinds which are latest. If any Potatoes are grown specially for exhibition purposes the best piece of ground should be reserved for them, working it well with the fork in dry weather until thoroughly pulverised, and if inclined to be adhesive a large quantity of charred refuse should be forked in. Draw the drills with the hoe, and do not cut down with a spade, cover the sets with 2 inches of compost, consisting of two parts sand, one part charred refuse, half part old lime-rubbish broken very small, the whole to be well mixed and sifted before using. *W. H. Divers, Kettleton Hall, Stamford.*

The Royal Horticultural Society.

THE twenty-seventh of March in this present year of grace will form a memorable date in the history of the Royal Horticultural Society. Freed from the trammels of South Kensington, it has made a new start, under promising auspices. By dint of much quiet labour, the chattels of the Society, including the books of the Lindley Library, were transferred to their new abode at Victoria House, 111, Victoria Street, Westminster, where, in a few days, it may be hoped, everything will be in position, and that the Society will be in possession of a library and reading-room such as it has not had since the old Regent Street days. Our present concern, however, is with the first of the fortnightly meetings held in the fine Drill Hall of the London Scottish Volunteers—a spacious building in James Street, close to the new offices, and which proved better adapted for the purpose than we had dared to hope. The exhibition was extensive and very interesting, largely attended by the fraternity, and at least better attended by the public than the Kensington meetings have been of late.

All three committees set to work as usual as if nothing had happened, and all three had plenty of occupation. An account of their labours is given in another column. At the conclusion of their work Sir TREVOR LAWRENCE, the President, addressed the members of the committees and the exhibitors in terms of welcome, hopefulness, and congratulation. He thanked, and most justly so, the exhibitors, the Press, and those who are toiling so hard to reinstate the Society.

He briefly alluded to the reasons for leaving South Kensington, calling attention to the fact that the conservatory there, in which so many meetings have been held, is soon to be pulled down. He alluded to the economic interests of horticulture, and to the desirability that horticulture and forestry should not, as heretofore, find no recognition in the councils of the Government, but find a place in the new Agricul-

their labours on the part of the Council of the Society.

It is worth notice, perhaps, that the first Certificate awarded under the new régime was one to Spathoglottis Kimballiana, and one richly merited, for it is a distinct and striking Orchid. As linking present and past, it is also noteworthy that recollections of the famous but ill-fated DOUGLAS, who did so much as a collector to

tural Department. This little address of the President is a good omen, and was appreciated by the listeners, who have not been accustomed hitherto to much recognition of

confer honour on the Society and on himself, were evoked by the exhibit of the little plant that bears his name.

As to the exhibition itself, we have said that it

A GROUP OF NAMED DAFODILS. (SEE KEY IN TEXT.)

was large, varied, and interesting. We shall not venture to impute blame for the crowded and ineffective arrangement of the exhibits, because, under the circumstances, it is much to the credit of the officials that so much was done with so little friction in a limited time. But now that a new start has been made, we may at least express a hope that those who have the arrangement of these exhibits will in future get out of the old grooves, and make some attempt to arrange the plants more effectively and artistically, so far as time will permit, to take care that undue crowding shall not be permitted, and specially that in accepting and arranging the plants some reference shall be made to the intrinsic importance and interest of the exhibits. A more generally interesting group of plants than that sent from the Royal Gardens, Kew, we have never seen than was exhibited on this occasion, but they were cruelly jammed up at one end of a long table, the other portion of which was occupied by rows and rows of formal Hyacinths, excellent of their kind, but which were decidedly out of place, and occupied room which should much more appropriately have been given to the miscellaneous plants from Kew and elsewhere.

One main object of the Society is to instruct the public, and therefore every effort should be made to display suitably plants of interest for their beauty, their utility, or botanical interest. The public is not specially instructed by lines and lines of Hyacinths and Cyclamens, which can be seen by the dozen or by the hundred in any florist's establishment. We are saying nothing in derogation of such plants—we are merely pleading that for this class of plants the Society has long done its work, and that in future the exhibits shall be treated according to their respective merits. It would be easy to see fifty or a hundred collections of well-grown Hyacinths and Cyclamens about London, but where, except at the Drill Hall on that particular day, would it be possible to see such collections of interesting plants as were contributed by several exhibitors and amateurs? A list of the plants exhibited from Kew is given in another column, but we may here specify some of the more remarkable, such as the new *Agave Baxteri*, originally from the Oxford Botanic Garden, and described in our present issue by Mr. BAKER. The collection of Aroids was most interesting, including, as it did, numerous *Arisemas*, with their elegant foliage and quaint spathes; and the fragrant *Philodendron Simsii*. The very extraordinary and by no means unprepossessing *Strelitzia Nicolai* has been already mentioned in our columns; in it the usual orange colour of the flower segments is replaced by dull white. The magnificent head of *Brownea* proved a fit rival of the Sikkim *Rhododendrons*, of which so many trusses were also exhibited: a branch of Coffee, thickly laden with berries, should have had attractions for the public. *Acacias* are always beautiful, and one in particular, *A. cultriformis*, with its blue scimitar-shaped false leaves, was very remarkable. The rarely seen *Greyia Sutherlandi* is a plant for a botanist rather than a florist, and the same may be said of the very curious mealy-looking *Aristolochia Wendlandi* from Hong-Kong. *Araucaria Cunninghamii* was shown with two or three cones, which we overheard one lady describe to her neighbour as a kind of Thistle—a proof that the educational work of the Society is needed. *Hamantus bicolor*—shown by Mr. BULL—was remarkable for the fact that its flower segments were nearly white, forming a contrast to the bright red stamens. Messrs. PAUL & SON'S *Rose Gloire des Polyantha* was received by acclama-

tion by the committee, as well it might be, for to the full truss of a *Polyantha Rose* it added the coloration of the old China Rose. For an account of the exhibits made by Messrs. W. PAUL & SONS, JOHN LAING & SONS, WARE, and others, we must refer to another column, merely stating here that their exhibits were worthy of their fame, and that their staunch loyalty, as that of all the exhibitors, to the Society, is an omen of great promise, and should be gratefully recognised by the authorities.

During the course of the day about twenty-five new Fellows were elected, and more than ninety others were nominated as guinea Fellows, whose election must be postponed till the passing of the new byelaws. Altogether, it must be admitted that the prospects are now hopeful. A continuance of the zealous labour and carefully planned reform of every department now in progress, and the judicious extension of the Society's work in hitherto neglected fields, must surely raise the old Society again to its former position.

GROUP OF NARCISSUS (see Supplementary Sheet).—Now that the season of Daffodils is at its height, we have deemed it appropriate to publish a group of these charming plants, as acceptable to the millionaire as to the million. The group was arranged and sketched by Miss BARR, and many of the varieties were exhibited in Messrs. BARR'S collection on Tuesday last at the Royal Horticultural Society. The numbered key plan (see p. 400) will enable the reader to ascertain the names of the varieties, while for their characteristics we cannot do better than refer to the descriptive catalogues published by Messrs. BARR. The displays of these flowers made by this firm, as also by Messrs. WARE, WALKER, HARTLAND, COLLINS BROTHERS, and GABRIEL, have done much to enhance the interest in these beautiful flowers.

ROYAL HORTICULTURAL SOCIETY.—At a general meeting of the Society held on Tuesday March 27, Dr. MASTERS, F.R.S., in the chair, the following candidates were duly elected Fellows:—W. H. Benton, Mrs. A. Bevington, F. C. Capel, J. B. Concanon, Richard Cooke, E. H. Devitt, Chas. Dimham, J. Stewart Dismorr, W. R. Foster, W. B. Hartland, Matthew Hodgson, Wm. Houghton, Thos. Jones, Wm. Langley, Gustave Le Doux, Capt. Maxwell, W. H. Munro, Miss Pearce, J. Cater Price, Reginald Ryley, P. C. M. Veitch, Chas. T. Wintle, Hy. Yool. About ninety names of proposed guinea Fellows were also read, subject to future confirmation, according to the revised bye-laws.

THE ENTERTAINMENT TO THE EMPLOYEES OF THE ROYAL HORTICULTURAL SOCIETY.—The committee who have this matter in hand have arranged that the *employés* shall be entertained at supper at the Bolton Hotel, Bolton Gardens, High Road, Chiswick, on Friday evening, April 6, at 7 P.M. Mr. HARRY J. VERRER has kindly consented to take the chair. Visitors will be gladly welcomed. Supper tickets, 5s. each. The hotel is 5 minutes' walk from Turnham Green Station. Those intending to be present should give their names to Mr. R. DEAN, Ranelagh Road, Ealing, the day previous.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—In a communication received from Mr. E. R. CUTLER we learn that the late Lord Northwick has by his will left a legacy of £100, free of duty, to this Institution; also that the Right Hon. JOSEPH CHAMBERLAIN, M.P., has appointed Wednesday, July 4, next, for the Anniversary Dinner of the Institution, upon which occasion he will take the chair.

INTERNATIONAL HORTICULTURAL MEETING OF 1888.—The *Chambre Syndicale des Horticulteurs Belges* has organised in Ghent an International

meeting of horticulturists from April 14 to 22, the date of which coincides with the Quinquennial Exhibition instituted by the Royal Agricultural and Botanical Society. The object of this meeting, as well as that of 1883, is to offer to the horticulturists of all nations a valuable opportunity of mutually discussing a few of the intricate questions connected with the development of their industry, and the extension of their commercial relations. These questions are to be of a purely commercial and industrial character, which is the only restriction placed upon the speakers, who in the statement of their theories and the expression of their wishes will enjoy the greatest freedom. One main point is described as the business of the day, that bearing upon the state the horticultural trade is placed in by the *Phylloxera Convention*; two others are submitted for discussion—the necessity of free exchange in horticultural transactions, and the formation of an International Federation of Horticulturists. Count de KENCHOVE, of Denterghem, Member of the Chamber of Representatives, President of the *Fédération des Sociétés Horticoles de Belgique*, and of the *Société Royale d'Agriculture et de Botanique de Ghent*, will be the Chairman of the meeting. It is desirable that each horticultural Society should be represented at the Congress by one or two of their members. M. AUG. VAN GEERT is the Chairman of the *Chambre Syndicale*, and MM. OCT. BRUNEL and JULES BURVENICH, Secretaries.

THE GARDENERS' ORPHAN FUND.—A meeting of the Executive Committee took place at the Calendonian Hotel, Adelphi Terrace, W.C., on the 23rd inst., Mr. GEORGE DEAL in the chair. The minutes of the last meeting having been read, it was unanimously resolved that the moneys invested on behalf of the Fund in Government Stock be converted according to the requirements of the recent Act of Parliament. The Hon. Secretary announced that the sum of £545 2s. 5d. was standing to the credit of the Fund at the bankers, and it was resolved that the proposal to invest a further sum of £500 be deferred until the next meeting of the committee. Mr. BARRON also reported that since the last meeting of that body the names of seventy-four new donors and subscribers had been received, the donations amounting to £29 1s. 6d., and the subscriptions to £19 5s. That the total amount promised as donations is £1150, of which £968 6s. has been received; and subscriptions £353 3s., of which £224 4s. had been paid. It was resolved:—That the annual general meeting of the subscribers to the Fund take place at 2 P.M. on the day of election—July 13; also that any voting paper duly filled up but unsigned by the voter, may be signed by a Life Subscriber or member of the committee. Some samples of money-boxes for subscriptions to the Fund were submitted, and a gross in two patterns ordered. Applications for money-boxes and subscription cards were received from Messrs. SUTTON & SONS and others. The sub-committee appointed to consider the proposal to hold a popular dinner reported that the same could take place at the Cannon Street Hotel, on the day of election, the tickets to be 5s. each, the dinner to be at 5 P.M. The report was adopted. Some correspondence with Sir JULIAN GOLDSMID, Bart, M.P., the President of the Fund, was read, and it is hoped that he will take the chair at the dinner. Sub-committees were appointed to carry out the arrangements of the election and dinner.

THE GHENT EXHIBITION.—Mr. H. PEARSON, Beeston, Nottinghamshire, who has been in communication with the manager of the London, Chatham and Dover Railway Company respecting the above, and has proposed to him the issuing of cheap circular tickets to enable horticulturists who wish to visit the bulb grounds of Holland after the exhibition—states that this railway company hopes to be able to issue through tickets at a good reduction, and of which fuller particulars will be given at a later date.

ROYAL INSTITUTION.—The following are the lecture arrangements after Easter:—Dr. Charles Waldstein, three lectures on "John Ruskin;" Mr. Walter Gardiner, three lectures on "The Plant in the War of Nature;" Mr. Sidney Colvin, three lectures on "Conventions and Conventionality in Art;" Professor Dewar, six lectures on "The Chemical Arts;" Professor T. G. Bonney, three lectures on "The Growth and Sculpture of the Alps;" Mr. Carl Armbruster, seven lectures on "The Later Works of Richard Wagner (with Vocal and Instrumental Illustrations);" Professor C. E. Turner, three lectures on "Count Tolstoi as Novelist and Thinker." The following are the probable arrangements for the Friday evening meetings after Easter:—Professor Flower, "The Pygmy Races of Men;" the Right Hon. Sir William R. Grove, "Antagonism;" Mr. James Wimshurst, "Electrical Influence Machines;" Professor J. K. Laughton, "The Invincible Armada: a Tercentenary Retrospect;" Mr. W. H. Barlow, "Building the New Tay Bridge;" Mr. Francis Galton, "Personal Identification and Description;" Professor J. A. Ewing, "Earthquakes and How to Measure them;" and a Discourse by Professor Dewar.

IRISH EXHIBITION.—With a view of bringing before the notice of the public the arts, manufactures, and industries of Ireland, with a hope of developing the same, it has been arranged to hold an exhibition at Olympia, Kensington, during this summer, from June to October. Agriculture receives due attention in the schedule, which is very comprehensive. Lord ARTHUR HILL, M.P., is the Hon. Secretary, and the offices are at Connaught Mansions, Victoria Street, S.W.

POSTAL ANNOYANCES.—Some of our trade correspondents are justly complaining that while circulars, sent as open letters, from abroad arrive here at the lowest rate of postage, our own firms are not allowed similar allowances, but that their circulars, though sent in opened envelopes, are charged at the letter rate of postage. The ways of the Post Office, as we know to our cost, are often as vexatious as they are erratic.

SHOW OF SPRING FLOWERS.—Among the exhibitions of the present season that of Mr. B. S. WILLIAMS, of the Paradise Nurseries, Holloway, may be mentioned. Some 600 Hyacinths, including many of the newest and best kinds, are now in bloom, as well as Cliveas, Anaryllis, and other spring flowers.

BEGONIA LUBBERSI.—We have received from Mr. PYNANT a plant of this species, the distinctness of which from *B. argyrostigma* has already been pointed out. It has in any case a very beautiful foliage; the petlate leaves are lanceolate, sharply pointed at both ends, the upper surface with a disc of dark green velvet, over which are scattered silvery spots, while the lower surface is of pale olive-green colour, with the nerves marked out in crimson. Comparison with *B. argyrostigma* leaves no doubt whatever as to the distinctness of the two plants and the superiority of the new comer.

"DER OBSTBAU."—The first number for this year of this useful little periodical of the Wurtemberg Fruit Association, devoted to pomology and fruit culture, is before us. The contents consist, amongst other matter, of methods of preparing the ground for and the planting of fruit trees. In the remarks on the income from orchards where each tree stands on 12 square metres of ground, the trees begin to bear after ten years, and each tree producing 3s. worth of fruit, the total value of which from a hectare of land carrying 830 trees would be 2790 mk. = £139 1s.—a sum which cannot be obtained with any other crop. Some interesting experiments in fruit culture at considerable elevations (710 metres) are detailed, from which we glean that the Norman cider Apple (Bitter Sweet), Gold Reinette of Blenheim, Parker's Green Pippin, White Astrakan,

and Emperor Alexander grew to a large size, some of the varieties having fine colour.

KILIMA NJARO PLANTS.—Among the plants collected by Mr. JOHNSTON on this tropical African mountain, and described by Professor OLIVIER in a recently issued part of the *Transactions of the Linnean Society*, is a gigantic *Senecio*. This tree-like *Grounel* is described as a tree 20–30 feet high, with elliptic leaves 12–15 inches long, and with heads of yellow flowers in panicles 1½ foot long. The trunks are erect, unbranched, and leafless to nearly the top, where the inflorescence springs from a terminal tuft of leaves, so that the plant, judging from the figure, has a weird uncanny look.

THE CHRYSANTHEMUM ANNUAL (71, Fleet Street, E.C.)—Growers of Chrysanthemums, and especially those whose tastes lead them to compete at exhibitions, will find in this compilation by Mr. LEWIS CASTLE (a competent observer), much useful information on this and cognate matters. The book is furnished with a portrait of Mr. EDWARD SANDERSON and Mr. WILLIAM HOLMES, respectively President and Honorary Secretary of the National Chrysanthemum Society.

MR. JAS. MILLS.—From the notice in our Gardening Appointments in last week's issue it will be observed by our readers that a change is about to be made in gardeners at Rendlesham Hall, Woodbridge, Suffolk, Mr. MILLS retiring, Mr. H. ROGERS, of Bygrove House, Clapham Park, filling the vacant situation. *Appropos* of the late gardener, a correspondent, evidently well acquainted with him, writes:—"Mr. MILLS, has been Head Gardener to Lord RENDLESHAM for a period of about seventeen years, and during that time several Orchids flowered under his care for the first time in this country. He has received several certificates and medals for various subjects; and as a cultivator and an exhibitor of fruit and other horticultural productions he has proved himself to be thoroughly master of his profession. He will leave Rendlesham on April 6, with the intention of commencing business on his own account. Mr. ROGERS was formerly for upwards of five years foreman in the gardens he will now take under his own charge."

MONTPELLIER BOTANIC GARDEN.—We have received the catalogue of seeds collected in this garden in 1887. It is an extensive list, arranged according to the natural orders, but the most noteworthy feature about it is the appeal to the directors of botanic gardens to be more careful as to the nomenclature of the plants they cultivate and distribute. Professor PLANCHON has sounded this note before, and we hope he will continue to do so till the evil is remedied. The Professor suggests the following means:—1. To exclude from the catalogues all the commoner plants which are not likely to be in demand. 2. To endeavour to include in the catalogue plants special to the particular region, and which, therefore, are likely to be well known to those who collect the seed. 3. To exclude from the catalogue, so far as possible, all plants the nomenclature of which has not been verified. 4. To exclude from the beds in the garden all species which have not been identified by previous cultivation in a special trial ground. 5. To endeavour in each garden to collect species of one genus, genera of one family, and so on, so as to afford opportunities of studying them monographically, and to notify in the catalogue that these groups have been specially studied. The catalogue of the Montpellier garden, drawn up on these principles, contains specially Mediterranean and Cerean plants, the determination of which the Professor is responsible for, as well as for the Ampelidæ and the Nymphæaceæ.

THE BEAN AND PEA BEETLE.—The Royal Agricultural Society has deemed it necessary to issue a special notice to agriculturists and gardeners warning them that seed Beans and Peas are this season infested in a most unusual degree by beetles (*Bruchi*), and pointing out the probable consequences of sow-

ing such infested seeds. It is said to be difficult to find (at least, in the south-eastern counties) samples of Beans—Ticks, Mazagans, and Broad Beans—they are free from black specks and holes, showing that they have been attacked by these beetles. Some samples have from 40 to 50 per cent. affected; others from 15 to 20 per cent. In one case of small Mazagans from East Kent there was a very small proportion free from spots and holes. It is thought that in all probability the warmth and dryness of the late summer were favourable to the development of these insects. Peas are not found to be so badly infested as Beans; they are, however, worse than usual, particularly some kinds extensively grown for podding. As the larvæ, or maggots, of the beetle live on the food stored up in the cotyledons of the Beans and Peas for the support of the future plant, it is clear that after germination, if it is able to germinate, the plant will languish and fail for want of a full supply of nourishment, and will be weakly and comparatively unproductive. Germination cannot take place when a Bean or a Pea has been infested by several beetles, which have made burrows all round the embryo. But it is a curious fact that the larvæ as a rule do not touch the embryo or vital part of the seed, and rarely directly injure it. This is possibly because it is uncongenial to their tastes. Besides the possible failure of germination, and the certain weakness of plants from infested seeds, the insects will be conveyed to the fields and gardens in the seed in largely increased numbers, to injure the next crop. *Prevention.*—Beans and Peas badly infested by these beetles should not be used for seed. As has been shown germination may be altogether arrested, or the plants will be weakly and unfruitful. The insects will be placed in conditions most favourable to their reproduction if they are put in the ground with the seed. It is recommended by the Royal Agricultural Society that the seed be kiln-dried at a temperature of about 120° Fahr., and if the operation be judiciously performed, this is said to destroy the insects without affecting the germination of the Beans and Peas. A better plan, however, and one less likely to injure the seeds, is to make use of paraffin. We lately saw a sample of Aquadolce Broad Beans which contained 45 per cent. of beetle-infested seeds, and a sample of Seville Longpods which contained 20.5 per cent. of injured seeds. These were put into common paraffin oil and allowed to remain for a few hours; when taken out every beetle was dead. Paraffin and heozoline oils are also said to make seed Peas less toothsome to birds.

KÖNIGSBERG.—Dr. LUERSSEN has been appointed Professor of Botany in place of the late Professor CASPARY.

PANCRATIUM FRAGRANS.

In these days, when there is such a demand for fragrant white flowers, it is a matter of surprise that *Pancretium fragrans* is not more commonly grown. Its cut flowers are remarkable, and as decorative plants when in flower they have few equals, surpassing *Eucharis amzonica* and *E. candida* in beautiful effects. There is no difficulty in regard to their culture to hinder their more general cultivation they being amongst the easiest of plants to grow when given a suitable temperature and abundant syringing, and under this treatment they yield several crops of their charming blossoms during the months of winter. Grown as an ordinary stove plant its usual time of blossoming is in the months of May or June; but it is as a winter blooming subject I wish to recommend the plant. With a stock of fifty plants or so there is no difficulty in having *Pancretiums* in flower from August to March, the same bulbs flowering three or four times during that period of time.

March is the best month to pot or repot the bulbs, and a compost consisting of one part good turf loam and one of peat, with a few dry horse-droppings and silver-sand, will meet their requirements. One large bulb will be quite enough for a 7-inch pot, and three ordinary bulbs may be placed in a 9 or 10-inch. The pots must be carefully and fully drained, the drainage being covered with a little sphagnum or other moss, to prevent the smaller portions of the compost getting into the drainage. It is as well to state that large specimens are very effective as

decorative objects, but are not so suitable for winter-blooming as small ones. In repotting, remove all the crocks and as much of the old soil from the roots as possible without injuring them, and if the soil be in a sour state it should be washed off entirely by working the ball about in a tub of tepid water. When this is necessary the roots should be dusted over with dry sand previous to being re-potted. Remove all the offsets from the bulbs as the work proceeds, and pot them up for stock, putting four or five in a 6-inch pot. As the plants are potted remove them to a house having a temperature of 65° to 75° at night, with a day temperature of 10° to 15° higher. Give no water until the young leaves have made some amount of growth, but syringe twice a day, morning and afternoon, with water warmed to 85°; and on sunny days the house should be kept moist by damping down, some light shading being used to break the power of the sun's rays through the summer season. When the pots are filled with roots a thorough soaking of weak manure-water should be applied once a week. As a general rule it may be said that the plants are better when kept on the side of dryness, and it is rarely, with the syringings they receive, that water is needed more than once in a week, and they should always be allowed to become perfectly dry at the roots before any water is given. Under this treatment our plants flower satisfactorily all through the winter months. There are other species of *Pantracium* that are well worth growing, but I have found fragrans to be the best for all purposes. When the flowers are to be packed for travelling the anthers should be removed, else the pollen will seriously disfigure them. *Pantracium* are subject to attacks from thrips, but a little double-refined petroleum will speedily rid the plant of this pest. *W. M. Baillie, Luton Hoo.*

HOME CORRESPONDENCE.

STRELITZIA NICOLAI.—*Apròpos* of the note on this in last week's *Gardeners' Chronicle*, I may say that in the large glasshouse of the Botanic Garden here a *Strelitzia* flowers every year which just now has a stipe 9 inches long. The spathe is blackish-green, with a red border. The exterior segments of the perianth are white, lightly suffused with red at the base. The interior petals are halbert-like in shape, and are blue, with long and pointed lobes. Is it a variety of *S. Nicolai*? It may be a form which unites *S. augusta* and *S. Nicolai*. *J. A. Henriques, Coimbra, Portugal.*

DAMAGED TREES FROM NURSERIES.—I should like to know if other gardeners experience the same disappointment as myself with young fruit trees obtained from nurseries. I have received from a well-known firm a Nectarine tree with nine leading branches well distributed and apparently healthy; but on closer examination I found all, with one exception, have a large brown spot at that point where, no doubt, they were fastened to the wire in training; and unless this case should prove exceptional, each branch so affected will die back to that point, and consequently the tree will lose nearly one season's growth. Should not the attention of nurserymen be drawn to this matter, in order that they may endeavour to find a preventative, or adopt a substitute for wire? *Tom Stone, The Downs, St. Neots.*

CYMBIDIUM ELEGANS.—Perhaps the note on this plant at p. 331 may have been rather empirical, and from what Mr. J. O'Brien says at p. 372 there is no doubt that the plant in question is, as at first stated, "but a variety of the well known *C. eburneum*," and not the *C. elegans* as described by him. With much of what this orchidic authority says I usually agree, but the statement that none of the *Cymbidiums* are safe in the *Odontoglossum*-house is, I venture to think, rather too positive. Mr. O'Brien says it depends on how warm this house is kept. I admit, a good deal depends on that, but as much will depend on the amount of light, water, and air afforded the plants. In a house here containing a mixed collection of plants, and in which the temperature during winter is allowed to range from 40° to 55°, the variations being dependent on that outside, are *Cymbi-*

dium giganteum, Mastersii, sinense, eburneum, and Hookerianum; the last has grown within the last three years from a tiny little plant to a good sized specimen, while all the others have considerably improved in the same time. I do not deny that it is probable the well-known stimulus of additional heat might have induced a more rapid growth; yet Mr. O'Brien may be assured that the plants are quite safe in the temperatures named. In the same house are grown *Odontoglossum crispum, O. grande, O. maculatum, O. bictonense, and O. vexillarium*, without the spot on the foliage some growers are troubled with. Besides these there are *Trichopilia, Oncidium, Bletia, Masdevallia, Maxillaria, and Arpophyllum*, which flower annually; also *Catlia, Angraecum, Dendrobium, and many others*, all of which get along quite sociably together. In summer fire-heat is discontinued, abundance of air, copious syringings, and as much light as possible are given, merely breaking the sun's rays by thin shading. Under this régime the plants build up a structure and acquire a constitution capable of withstanding great variations in temperature; moreover, insect pests are almost unknown. *F. Ross, Pendell Court.*

THE RECONSTRUCTION OF THE ROYAL HORTICULTURAL SOCIETY.—The Society seems now on the highway to popularity and usefulness, provided it goes far enough. The guinea Fellowships, conferring all the status and power of four and two-guinea ones, a bold step in the right direction, and I trust Mr. Wilson will get his 500 new Fellows at a guinea. But why not go further and fare better? There is no difference in principle between the admission of half-guinea Fellows and guinea ones. Only yesterday two-guinea subscribers were the lowest standard of safety or gauge of wisdom for the management of the affairs of the Society; now the franchise is lowered to a guinea, and from henceforth the guinea Fellow is to be reckoned as discreet and wise as the two or the four-guinea ones. In these days of popular education and household suffrage, when the bounds of freedom are daily growing wider, where can be the difficulty and danger of lowering the terms of full fellowship for *bona fide* gardeners to half a guinea? While not a few of us, for our love of horticulture, might be willing to subscribe a guinea, for the purpose of founding and supporting a truly national horticultural society, yet I contend that half a guinea is a liberal price for all that practical gardeners really want—admission to all the premises and shows of the Society, a copy of its publications, and a full unfettered voice and vote in the management of its affairs. More than that, the half-guinea fellow really pays more in proportion to what he would receive than the four-guinea subscriber with all his personal and relative advantages. Were there any necessary connection between wealth and wisdom it is obvious the Society would never have been in its present condition. The present Council and committee have acknowledged this to the extent that guinea Fellows may be sufficiently discreet and wise to save the Society, provided they are sufficiently numerous—say 500 or 1000 of them. This, which is a step in the right direction in one sense, only makes bad worse in another. For the mere fact of suggesting gardener Associates without votes is virtually an official proclamation by the Society that practical gardeners are unworthy of its confidence. And yet the first Royal Charter so entirely trusted practical gardeners, without any money qualification or subscription whatever, as to place them on its first Council; and not a few will be greatly surprised to learn that there is not a word or clause in the Charter to prevent gardeners being made Fellows at half-guinea subscriptions, or without money or price. That the Council have such power under the existing Charter is proved by their lowering the franchise of Fellows from two guineas to one; and they have equal power, neither more nor less, to lower it to 10s. 6d. if they choose. Such being the case, I trust that not a single gardener will enrol himself as an emasculated gagged Fellow or Associate, but will demand the vital rights of horticultural citizenship for his money—free admission, free speech, and a free and full vote. It rather surprised me that such a good friend of the craft as Mr. Wilson makes no appeal to gardeners to assist him in forming part of his 500 new Fellows at a guinea each. He appeals to the owners of gardens, possibly surmising that the guinea is too high for gardeners, or—which is less likely—that the latter will be content to become emasculated Associates—dear and nasty—at half-a-guinea each; for this

precious half-guinea toy also admits to all the exhibitions and meetings of the Society, where the Associates may sit with gagged mouth and voteless hand, to hear, see, and endure the wisdom or folly of his betters—that is, his "richers." And then these Associates are such vile and dangerous fellows of the baser sort, that of course they must be verified as *bona fide*, &c., and must be recommended for election by two Fellows. How much longer will the Royal Horticultural Society go on and on heaping insult to injury upon practical gardeners? It is little wonder that Mr. Wilson, who has known its old ways to ruin so well, did not appeal so as to swell his list of 500 guinea Fellows. *D. T. Fish, March 20.*

EUCHARIS AMAZONICA.—According to my experience here, strong loamy soil is best adapted to grow these plants. Our potting soil is strongly intermixed with clay, and we mix very little leaf-mould amongst it and no peat, but some decayed manure, some half-crushed bones, and sharp silver-sand, and the plants invariably do well. We are never visited by either mites or disease. We give them when flowering plenty of manure-water. I find that some of my neighbours are losing their plants fast, which I attribute to their starving methods and drying them off; both practices I strongly condemn. I am of opinion that as long as they are kept in robust health mites will not attack them, although the lot Mr. Keetley alludes to have mites, and are growing vigorously all the same, which I can hardly understand. *A. Macdonald, Royal Asylum, Cheadle.*

RHODODENDRONS AND PEAT.—There is a prevalent idea, even among some gardeners, that a peaty soil is indispensable for *Rhododendrons*, and often great expense is incurred in bringing peat from a distance in order to make a *Rhododendron* bed. The digging out of the solid natural soil and replacing it with peat not infrequently leads to a greater evil—one that is seldom foreseen. The new peat acts as a drain for the surface-water percolating the solid ground surrounding it, and the spongy peat holds the water precisely as a sponge does, consequently the bed becomes waterlogged, and the failure of the *Rhododendrons* is the natural sequence. If peat beds are made in heavy soil drains either of stone or pipes must be laid at the bottom, so as to conduct away quickly all superfluous moisture. A case came under my notice recently, where *Rhododendrons*, which, when planted were the best obtainable—the peat also as good as it could be got—after two years turned as yellow in the leaf and as sickly-looking as if they had been planted in pure chalk. The peat in this bed I found quite in the condition I have described, sour and waterlogged. It is pretty generally known that *Rhododendrons* and most other shrubs of the Heath tribe abhor chalk, or any kind of calcareous soil. If planted in it they soon languish and in time die outright. On the other hand, it is a moot point whether or not the *Rhododendron* actually likes peat above all other soils. I have given some attention to the point during the past two or three years, and the result of my observations is that the very finest specimens—finest in growth, foliage, and flower—have been those growing in a fibry loam, with an admixture of a little peat and sand sufficient to make the whole porous, yet not too light. We know how grand the *Rhododendrons* and other so-called American plants thrive at Knapp Hill, Bagshot, and throughout the Bagshot sand district, and we also know that in nurseries situate in districts where there is no peat for miles around there are as fine *Rhododendrons* as any grown on peat. The Handsworth and Berkhamstead nurseries may be cited as instances of this. But the question of peat *versus* loam for these glorious shrubs is of not so much importance to nurserymen as to owners of private gardens, who, as a rule, if not pitched upon a peaty soil, bewail the absence of *Rhododendrons* in their gardens. There must be hundreds, and probably thousands of gardens the soil of which is not peaty or sandy, but with an absence of chalk, where *Rhododendrons* would grow to perfection, but from which they are now absent because their owners think it useless to plant them. On the other hand, their culture has been abandoned after the expense of making peat-beds, the failure of which arises from defective draining. One of the chief American nurserymen—I think it is Mr. S. Parsons, of Long Island—asserts that peat is positively injurious to *Rhododendrons* in his nursery, and has not used any for these shrubs for many

years. So long as there is no chalk in the soil, and it is not pure sand or the stiffest of clay, no one need despair of growing the finest varieties more or less successfully. Bad soils, whether excessively light or heavy, can always be ameliorated to some extent in country gardens where fibrous turf—even that from the roadsides—can be got readily for mixing with the soils. Some sorts of *Rhododendrons* thrive better than others in a loamy soil, and this is very noticeable in a nursery when the sorts are grown side by side. Perhaps some competent grower could give a list of the best of those that thrive best in a moderately stiff loam. *W. G.*

MASDEVALLIA CULEX (p. 361).—My first acquaintance with this name was made on seeing among some plants from the Rev. Mr. Norman's collection to be sold at Stevens' several lots of "*Masdevallia culex*—provisionally named." I purchased one, which, on flowering, appeared to be *Pleurothallis macrolepharis*. More recently, I noticed in the report of one of the few meetings of the Royal Horticultural Society of late years, which I have missed, that Sir Trevor Lawrence had sent a plant of it; and when next I saw his Orchid grower, Mr. Bickerstaffe, I remarked to him that it was most probably *P. macrolepharis* but he informed me that Professor Reichenbach had seen the plant in the Buford collection, and had pronounced it to be *P. Barberiana*. Afterwards, when speaking with the late Mr. John Day on the subject, he said that the plant known in gardens as *Masdevallia culex* was *Pleurothallis Barberiana*. At the meeting of the Scientific Committee referred to, I stated the facts as I now put them, but only *P. Barberiana* being mentioned in the report, seemed to show that those views were taken to be substantiated. I had noticed the difference of leaf mentioned by Mr. R. A. Rolfe among the plants on the occasion of the sale, and I therefore think that his suggestion of both species of *Pleurothallis* being in collections under the name of *Masdevallia culex* the correct one. Those who have the plants in question in flower should send specimens to Mr. Rolfe if they find any difficulty in determining the species by the aid of his note at p. 361. A strong lens is a great assistance in examining the flowers, for really many of the minute flowered Orchids, which are generally said to resemble each other very closely, are found not to be in the least alike when enlarged even a few diameters. *James O'Brien*.

A CURE FOR MILDEW.—Mildew on plants is one of those visitations that often perplex a gardener, and give him a good deal of trouble. From time to time certain preparations have been announced as cures for mildew; but in the case of most, if not all of them, objections have been taken to their use on the ground that they leave a sediment behind them which disfigures leaves and fruit both. The following gives an old but excellent remedy, which, while efficacious, does not leave behind, after being applied, any objectionable deposit. It is prepared in this way:—To every gallon of water add 3 lb. of unslaked lime and 4 lb. of sulphur, boil the whole for 40 minutes, keeping it well stirred. When ready allow it to settle, and draw off the clear liquor and bottle it for use. When employed a quantity equal to a large wineglassful or half pint should be placed in a 3-gal. can of water, and the parts affected washed or syringed with it. The preparation will keep for any length of time: one gardener who uses it states that as long as five years ago he boiled 8 gals. in a copper and bottled it off, and he has some of it yet, and finds it to be as efficacious as when first made. He also finds it to be of advantage to paint the hot-water pipes with the solution. *R. D.* [Do not use it on Vines with Grapes on them or other fruit trees in bearing unless it be washed off perfectly 10 minutes afterwards. The globule of the mixture which would hang from the bottom of the berry or fruit would destroy the skin at that point and prevent further development. *En.*]

ANEMONE ST. BRIGID.—I should like to draw the attention of those who have not grown this beautiful flowering plant, to the readiness with which it may be raised. I was much interested in reading in a daily paper how the Princess of Wales a few years ago, when visiting Ireland, was presented with a bouquet entirely made up of these Irish Anemones. I procured a packet of seed from Mr. Ware, of Tottenham, and sowed the seed in a pan, about the middle of February, placing it in brisk heat, where the seeds soon germinated. When large enough to handle the young plants were pricked out into boxes

and again placed in heat. The growth made was very slow, and very little foliage appeared, but after transplanting them to the open in May I was surprised at the size of the main roots. In their new quarters they soon got established, and came into bloom in the month of August, their flowering lasting until cut down by frost late in the autumn. As a cut flower for boxes we find them very useful, lasting a long time. *Johnston, Hints Hall, Tunworth.*

DRYING OFF ALLAMANDAS.—With reference to your editorial query (p. 310) respecting my treatment of Allamandas, I should like to say that we give our plant very little water after the month of October; but then I should state that we have not the entire control of the roots of the plant in question, for they have pierced through a 9-inch brick wall, and are under the flat stone floor of the stove. By withholding water as stated, there is no difficulty in getting the plant to rest, and by pruning time the wood is as hard as that of a well-ripened Black Hamburg Grape Vine. *T. Newton, Campsall.*

I quite endorse what "Mayflower" says—that Allamandas should not be dried off; in fact, I consider such a practice to be injurious to any stove plants although it is often done. I have two very large plants of *A. Hendersoni* here which flower nearly all the year round. Towards November I give over watering quite so freely, and only do it sparingly until the end of December, when I cut them down and start them afresh, giving plenty of liquid manure until they begin to bloom. *A. Macdonald.*

As regards this subject I may say that I very much prefer the drying-off method, as it allows more light to shine into our stoves during the winter time, when such plants are fastened under the roof. Cut back plants may be shaken out and the ball made smaller, thereby affording more space for fresh compost, which adds considerably to their future vigour. I have a very old plant here which, with others, is treated in this way, and which, for profusion of bloom, colour in the flowers, and the large space it occupies, can scarcely be surpassed. How often do we see plants at exhibitions 4 to 5 feet high with not more than a dozen blooms in all. Were they dried off during winter, shaken out when rotted, and the shoots carefully thinned out, a marvellous difference to their appearance would be presented. *Johnston Hints Hall, Tunworth.*

I am surprised that your correspondent, Mr. Thomas Newton, has not seen Allamandas flower freely when treated as evergreens. Now, I have a plant so treated, and I doubt whether anyone has seen one with more flowers than it has carried. Mr. Newton says he has gathered one hundred at a time off the plant at his place, but I have known 400 to be gathered at one time, and a single panicle to produce twenty-eight blooms in succession; by the year's end thousands have been gathered altogether. To dry off Allamandas seems to me to be a hard trial for the plant, because water must be totally withheld. I do not dispute the fact that your correspondent's plant does well, but I can assure him it would do better if just enough water were to be given it so as to cause its leaves to remain, thoroughly thinning out the shoots in January or February, while in the summer months the shoots should not be allowed to get too much crowded. *Mayflower.*

BRUGMANSIA (DATURA) LUTEA.—What is this plant, and why is it so rare, compared with *B. suaveolens* and *sanguinea*? I never remember to have seen it in bloom but twice, and at places so widely apart as Hatfield House and Chatsworth. I obtained cuttings of it from Mr. Bennett, rooted and planted it out in a cool-house with the two species already mentioned, and it perished apparently from the cold. From this failure I have considered it more tender than the other greenhouse *Brugmansias*. The flowers are, as far as I recollect, funnel-shaped, after the style of those of *B. suaveolens*, and fragrant, though not to the same extent. I have also a dim recollection of having seen a semi-double or hose-in-hose *Brugmansia* like *B. Knightii*. Is there a shrubby species of that character, and is it also fragrant? The *Brugmansia lutea* does not find a place in the *Dictionary of Gardening* now issuing from the press, nor do I remember seeing it at Kew. If equally hardy it certainly seems to deserve a place beside the two species named in my first sentence. The *B. suaveolens* would look yet more pure if flanked on either side with *B. lutea* and *sanguinea*, and perhaps no finer plants could be named for the furnishing a lofty house with abundance of flowers. Unfortunately, the blooms have no com-

mercial value—for, if I mistake not, the blooms of *lutea* are almost as perishable as those of *suaveolens*, while those of *B. sanguinea* are more of tubes than trumpets, and are destitute of fragrance. *D. T. F.*

SOCIETIES.

ROYAL HORTICULTURAL.

TUESDAY, MARCH 27.—The new location of the Society in London for the exhibitions and fortnightly meetings—the Scottish Drill Hall, James Street, Westminster—was very well filled by the exhibits of nurserymen, amateurs, and gardeners; indeed, the amount of tabling supplied was inadequate, and much of what was exhibited was crowded together in a manner that did not permit of its being properly inspected. As there is ample space within the building, this is doubtless a matter which will receive attention on the occasion of the next meeting, a fortnight hence.

Exhibitors of Orchids and other tender subjects must have felt some concern about their plants, the temperature of the hall being at a low point the whole of the day.

The Royal Gardens, Kew, made the premier exhibit as regards the rarity and variety of the plants shown, and afforded a useful object-lesson to all the craft, more especially to those who are inclined from one reason or another to keep in certain well-known ruts. Amongst the nurserymen, Messrs. Veitch & Sons, B. S. Williams, Laing & Sons, Lane & Son, Barr & Son, C. Turner, Collins Brothers & Gabriel, Paul & Son, and Cheal & Son made the largest displays.

Scientific Committee.

The meeting was held on this occasion in the Committee-room of the Drill Hall—a room not very convenient of access and suffering from the very great objection that the Library is in another building. When the large room at 111, Victoria Street is completed doubtless the meetings will be held therein. The difficulty then will consist in the necessity of removing the plants from the Drill Hall for the purpose of examination, and, moreover, at a time when it is particularly desirable to link together, rather than to dissociate the several committees. It is unfortunate that they should have to meet in separate buildings, but when there is a choice of evils the least must be the one selected. On the present occasion the committee was represented by Sir Joseph D. Hooker, K.C.S.I., Chairman; Messrs. R. McLachlan, F.R.S., James O'Brien, Professor Church, Mr. F. Pascoe, Dr. Lowe, Mr. Albert Michael, G. F. Wilson, F.R.S., H. N. Ridley, British Museum; Professor Scott, School of Science; Professor Boulger, Dr. Masters, F.R.S., and Rev. George Henslow, Secretary.

THE BLUE DAISY.—Dr. Masters reported that the plant exhibited from Tangier at a previous meeting by Dr. Lowe was *Bellis annua*. Sir Joseph Hooker mentioned that it was common in the neighbourhood of Tangier, and that it was different from the plant found on the Atlas Mountain (*Bellis cerulescens*).

DISPERSAL OF THE SEED IN PINUS INSIGNIS.—Dr. Masters, alluding to the great differences that exist in the species of *Pinus*, as to the time at which the constituent scales of the cone separate in order to liberate the seed, showed a series of cones of *Pinus insignis*, the oldest of which bore the date 1864. In this all the scales were widely separate. The most recent cones dated from 1877, and in them the scales were not at all separated. Between these two extremes, cones were shown exhibiting almost every intermediate stage of separation. It is to be remarked that the separation begins generally just above the centre of the pendulous cone on the side furthest away from the branch, at the place where the obliquity of the cone, due to the free exposure to light and air, and the absence of obstacles afforded by the branch was greatest, and that it follows a spiral course towards the base of the cone. The scales separate in successive spiral coils, till, at length, all except a few at the base and apex respectively, and which are probably sterile, are separated one from the other.

SEMI-DOUBLE AND OTHER ONCHIDS.—Dr. Masters referred to various specimens submitted to him for examination. Among them were the following:—*Semi-double Flowers of Calogyne flaccida*.—These were obtained from M. Sallier, through the courtesy of M. Schneider. The conditions varied slightly in

different flowers, but the most noteworthy case was one in which there were three sepals, three equal petals resembling the sepals in form, a column, and two lips; these latter organs, therefore, representing two stamens of the outer whorl. According to the generally accepted Darwinian notation the arrangement of parts might be thus expressed:—

A2 and A3 being represented by the supernumerary lips.

Cattleya Triane.—Three flowers were brought to the committee at a former meeting by Mr. O'Brien.

In (1) the two lateral sepals were present, and also two petals, one median, occupying the place of the absent sepal, and one opposite to it, forming the lip. The arrangement may be illustrated thus—

This flower, then, afforded an illustration of a tendency towards a dimerous and decussate arrangement of the parts of the flower, such as is frequently seen in malformed Orchids.

In (2) the dorsal or median sepal was also wanting, its place being occupied, as in No. 1, by a petal, so that of the two lateral petals one was dislocated from a lateral to a median position, while the other was adherent to the column. The other parts were normal. It would appear that in this case as if, for some reason or other, the median sepal was not developed; 2, that the axis of the flower underwent a twist of 45°, so as to displace the petal and transpose it into the position of the sepal; 3, at the same time that this unusual growth was taking place on one side of the flower development was partially arrested on the other (the concavity of the helix), so that the petal remained in unison with the column.

The third flower was normal in all respects, except that the median sepal had the appearance of a lateral petal. The case was one, therefore, of petalody of the sepal.

(4) A fourth flower of the same species, forwarded by Mr. Marcus H. Voss, was remarkable for the absence of one of the side sepals without other change. Here, again, was another illustration of the tendency to a dimerous condition, there being two sepals (in this case placed obliquely), but one of them forming a pair with the lip, and two lateral petals.

Phaius grandifolius, Petoria.—Sir Trevor Lawrence obligingly sent a flower of this species with two sepals placed right and left, and two median petals, each lip-like in character, and provided with a spur. The column was straight, the anther imperfect and incumbent.

This flower then again illustrated the dimerous condition as to number of parts and the peloric condition as to the form of the petals.

Odontoglossum crispum, Synanthy, &c.—Mr. B. S. Williams forwarded a raceme of this plant which showed a tendency to branch or become paniculate. The branch, however, instead of becoming detached remained in union with the main axis producing somewhat of a fasciated condition. As a result of this union it happened that sometimes the flowers were scattered, while in other cases a node of the main axis was placed side by side with the branch, so that two flowers belonging to different axes were brought into contact, and not only this, but in some cases there was actual synanthy or union of two flowers. In one of these flowers there were four sepals in decussate pairs, four petals also in decussate pairs, and two lips placed opposite to two columns.

There were thus twelve parts present instead of fourteen, two sepals being missing, presumably one of the lateral sepals of each of the two flowers being suppressed at the point of contact. In many cases of synanthy the suppression of parts takes place to a much greater extent, but then it is relatively uncommon to see synanthy between two flowers belonging to different branch systems.

MALFORMED FUCHSIA.—Baron von Mueller kindly sent a flower, in which the ovarian cavity is absent, the flower-stalk ending in a club-shaped expansion, from which are given off two stalked leaves, while the scars between their bases indicate the existence of others which have fallen off. The sepals are represented by two coloured segments, both stalked. One of the sepals is three-lobed, the central lobe oblong lanceolate and coloured like the sepals (pinkish-white), the lateral lobes shorter, broader, and coloured like the petals (purple). The second sepal is divided above the middle into two oblong petaloid lobes. Then follow three obovate stalked petals. The stamens are absent, but there is a shallow disc surrounding the base of the ovary. This latter organ is superior, one-celled, with three

showed a double series of vascular bundles, the outer belonging to the flower-stalk, the inner to the carpels embedded in its substance. It would seem, then, that the complicated arrangements of this flower may be referred to dialysis, metamorphy, and displacement of various organs associated with median floral proliferation, or the production of a secondary flower from the centre of the first in the position occupied by the style in a normal flower.

ANTHURIUM CHAMBERLAINI.—Dr. Masters exhibited a drawing of a magnificent new Anthurium, which had appeared accidentally with an importation of *Cattleya Gaskelliana*, in the garden of the Right Hon. J. Chamberlain. The heart-shaped leaves are of gigantic size, and the large boat-shaped spathe is of the richest crimson colour. Mr. Cooper (gr. to Mr. Chamberlain) speaks in high terms of this plant as a decorative plant. A full technical description, together with an illustration will shortly be published in these columns.

EUCALYPTUS UNIGERA.—Dr. Masters showed specimens of this Tasmanian species in flower and fruit. It had been received from Whittinghame Gardens, Prestonkirk, near Edinburgh, and not far from the sea. The tree was perfectly hardy. An illustration will shortly be given in these columns.

DAFODIL WITH CRESTED CORONA.—Rev. E. C. Gabbett sent through Dr. Masters two flowers of a curious *Daffodil* from plants growing on his lawn in Co. Limerick. The "frill," or outgrowth is produced from the outer surface of the corona, which has thus a very peculiar appearance, see fig. 59. Mr. Gabbett reports that six blooms were so affected, and that in former years, when the weather was more propitious, the frilling was more pronounced. Mr. Gabbett had observed this peculiarity for four or five years.

FRINGED CYCLAMEN.—Mr. O'Brien showed a flower of this variety in which the petals produced a crest-like outgrowth from the upper surface of the petals, as figured in our columns, vol. xxiii., p. 536. But in this instance there was the additional peculiarity that the petals were not reflexed as usual, but formed a bell-shaped corolla. Dr. Masters adverted to the anatomical peculiarities of these flowers, which were referred to Dr. Scott for further examination as to their structural details.

DOUGLASSIA LEVIGATA.—Mr. G. F. Wilson alluded to this plant as having been shown before the Floral Committee as a charming dwarf alpine plant exhibited from the Royal Gardens, Kew, and proposed that it should receive a Botanical Certificate, which was agreed to. It is a low growing plant with tufted leaves and lilac flowers, like those of an *Androsace*, but larger and with the tube of the corolla longer than the calyx, and with only two seeds to the capsule. The species are natives of North-Western America, the first known species having been collected by Douglas not far from the sources of the Columbia River, and named in his honour by Dr. Lindley.

HYBRID PHALANOPSIS.—Mr. Ridley reported on the *Phalanopsis* shown at the last meeting as a cross between *P. amabilis* and *P. rosea*, but stated that he was unable to detect any trace of *P. rosea* in it. Mr. O'Brien remarked that the influence of the cross was sometimes observable in the vegetation of the plant, even when it was not conspicuous in the flower.

ACACIA ARMATA.—Mr. Pascoe reported upon some leaves of *Acacia armata* sent by a correspondent of the *Gardeners' Chronicle*, and from the surface of which a brownish outgrowth proceeded. This was ascertained not to be of fungus origin, and it was considered probable that it might be the work of a Coccus. Mr. O'Brien alluded to the formation of similar excrescences as a consequence of insect or aphid punctures.

ECHINEXA HORSFIELDII.—Mr. T. Christy sent some seeds of this plant, not unlike roasted coffee. The natives of Java use them as a tonic and to arrest the spitting of blood. The shrub is the only known species, and grows in the mountain districts of Java and Formosa. Dr. Horsfield says the natives use the seeds as an antidote to any poison, and Leschenault says the powdered fruits mixed with food prevents diseases. Mixed with Lemon juice they are also applied externally to wounds.

COLA CHOCOLATE.—Mr. Christy sent samples of chocolate made from the seeds of *Cola acuminata* and which he had ascertained to be useful in certain forms of indigestion.

BAMBOO CASE.—Rev. G. Henslow exhibited a box which had contained seeds sent from Japan. Professor Church stated that the form of some of the Italian drug-pots of the fifteenth and sixteenth

FIG. 59.—FRILLED DAFODIL.

parietal placentas, and surmounted by three styles, coherent all the way up, with the exception of the distorted stigmas.

Proliferation, &c., in a Fuchsia.—To Mr. Douglas I am indebted for the extraordinary flower shown in Mr. W. G. Smith's drawing (exhibited). In this case the ovary was present, but there was no flower-tube above it. In place of that the ovary was surmounted by a tuft of sepals, petals, and stamens, forming an entangled mass, some of the parts being leafy, others petaloid, others stamenoid, with others presenting various intermediate characteristics. The flower had partly fallen to pieces before I examined it, but I could make out as I suppose the presence of four leafy sepals, as many leafy petals, and then a number of parts whose exact relative position I was unable to make out, and which presented the intermediate characters before mentioned. Within these sprang a second flower with a curved calyx-tube giving off four sepals and as many petals. The stamens were increased in number, some nearly perfect, others represented by long filaments terminating in spoon-shaped petaline laminae. The ovary of this flower was superior, but very imperfect, and surmounted by a style divided into two stigmatic lobes. A section across the ovary of the flower

centuries appeared to have been modelled from these Bamboo vases.

Araucaria imbricata timber.—Mr. Ford, gr., Leonardslee, exhibited slabs of wood cut from a tree of this species, and which at 6 feet from the ground girthed 26 inches, the tree being 35 feet in height. The wood was yellow, soft, evenly grained, and, judging by the distance between the rings, quickly grown.

Plants Exhibited.—From Mr. Ware came specimens of the elegant *Leucoum trichophyllum*. Sir Trevor Lawrence sent *Masdevallia Carderi*, a species remarkable for its deep and broad cup-like flower-tube. To this, as also to *Trichoglottis fasciata*, and the *Douglasia* before-mentioned, Botanical Certificates were awarded.

Floral Committee.

Present: G. F. Wilson, Esq., in the chair; and Dr. M. T. Masters, Messrs. J. O'Brien, E. Hill, A. F. Lendy, H. M. Pollett, J. Dominy, H. Ballantine, C. Pilcher, G. Paul, R. Dean, T. Baines, W. Holmes, W. Wildsmith, G. Sniffeld, W. H. Loder, W. Bates, H. Herbst, J. Fraser, J. Laing, W. Goldring, W. Wilks, Shirley Hibberd, B. Wynne, and J. Walker.

Orchids.—Sir Trevor Lawrence, Bart., M.P., Burford Lodge, Dorking (gr. Mr. Bickerstaffe), contributed an interesting and varied lot of Orchids, embracing both showy species and those whose chief merit lay in their singularity. *Dendrobium crassinode superbum* was a grand plant, the flowers being larger and more highly coloured than in the type. He also had *Spathoglottis Kimballiana*, rich yellow, like a fine yellow *Phalenopsis*: the lip was spotted with purple; *Odontoglossum Andersonianum* (a very fine variety), *Masdevallia Harryana acantho-fofia*, *Angraecum Leonis*, *Masdevallia Carderi*—one of those which appear to produce its flowers from the rootstock—the flower itself is pale yellowish-brown; also a large well-flowered piece of *Cymbidium eburneum*, creating a grand effect; *Cypripedium Measuresianum*, *Dendrobium Cambridgeanum*, *Odontoglossum Cervantesi roseum*, *Angraecum Ellisii*, pure white, with eighteen flowers on the spike; *Epidendrum glumaceum*, a strange looking species; *Masdevallia Lindenii superba*, large rich flowers; and *Trichoglottis fasciata*, &c., were shown. *Anthuriums*—*A. carneum* is a good brightly coloured species, with a large spathe; *A. roseum* is of too livid a hue; while *A. Rothschildianum* is attractive on account of its white mottling.

Mr. Ballantyne, gr. to Baron Schroder, The Dell, Egham, showed two choice Orchids, viz. *Dendrobium splendidissimum grandiflorum*, showing the deep colouring of the lip very well as the sides do not close over—sepals and petals white half way up, the rest rose; the other was *Phalenopsis John Seden*, the new hybrid recently fully described and illustrated in our columns.

A pale form of *Cattleya Loddigesi*, Doux's variety, and a cut spike of *Dendrobium speciosum*, came from the garden of Gustav Doux, Esq., East Moulsey. Several *Cypripediums* raised by N. E. Cookson, Esq., Oakwood, Wylam-on-Tyne, were exhibited by F. Sander & Co., nurseries, St. Albans. These consisted of the following:—*C. plenerum*, from *venustum* × *villosum*, and *C. lineolare* ×. Both have been described in former numbers, (see pp. 40, 447, vol. i., 1887.) Mr. Sander showed also *Masdevallia Sanderiana*, a flower externally and internally of a dull crimson. The tails are variously twisted, 3 inches in length, and of a yellow tint.

A pure white form of *Cœlogyne cristata* came from H. M. Pollett, Esq. Fernside, Bickley (gr., Mr. Parkes). The flowers are as large as the type, of the purest white, and number five on a flowerstalk. A Cultural Commendation was made.

A noble example of *Lycaste Skinneri* was sent by W. C. Pickersgill, Esq., Blendon Hall, Bexley (gr., Mr. Moore). It was a light form, every flower perfect, and of a large size, the whole plant measuring nearly 2 feet across.

A group of Orchids in variety were sent by A. H. Smee, Esq., The Grange, Hackwood. (gr., Mr. Cummins). These consisted of *Cattleya Trianae* var. *Emile*, with pale coloured sepals and petals, and dark purple lip; another *C. Trianae*, bearing one spike of bloom, had been grown out-of-doors last season to test the possibility of that method of culture. All that can be said about it is, that the plant lived and bore a flower, but that the method will not produce fine growth or flowers. Other Orchids were *Phaius Wallichiana*, with four flower-spikes; *Dendrobium macrophyllum giganteum*, a rosy-purple coloured bloom, having in the throat a dark purple

patch; *Oncidium sarcodes*, *Zygopetalum sarcodes*, *Masdevallia Shuttleworthii*, some *Odontoglossums*, &c. A Bronze Medal was awarded.

MISCELLANEOUS.

Messrs. J. Laing & Sons, Forest Hill, and Mr. B. S. Williams, of the Paradise Nurseries, Upper Holloway, each received a Silver Banksian Medal for a group of miscellaneous plants. Messrs. Laing's was a tasteful arrangement of *Crotons*, *Palms*, *Pandanus Veitchii*, and *Dracæna Lindenii*, with *Azaleas*, *Erica ventricosa*, sprays of *Acacia Drummondii*, and various Orchids, including a number of varieties of *Odontoglossum crispum*; there were also *Cattleya Lawrenceana* and *Dendrobium Brymerianum*. Mr. Williams' group contained *Amaryllis* of much beauty in *Empress of India*, *General Roberts*, *John Heale*, and others; *Cliveas*, for which the Holloway Nursery is famous, contributed a few fine-flowered examples; *Toxicophlea spectabilis* was shown as a plant of 2½ feet high, and full of its corymbs of white flowers. Of *Cypripediums* we remarked *Boxallii*, *veraxium*, and *villosum*; *Dendrobium Wardianum*, several *Odontoglossum crispum*, and *Dendrobium glumaceum*; these completed the principal flowering plants. Amongst the foliage plants used as a background was the graceful *Cycas undulata*.

A whole sheaf of white Lilac in excellent flower came from Mr. Drost, nurseryman, Richmond.

Mr. C. Turner, Royal Nurseries, Slough, showed a choice stand of new Tree Carnations, which, for size of bloom and pleasing tints, would be hard to beat. A large number of *Cyclamen giganteum* in four or five colours came from the same nursery, the white, and white and purple strains being in every way very good. A Silver Banksian Medal was awarded for the *Cyclamen* group.

Probably the most remarkable feature in the show was the splendid collection from the Royal Gardens, Kew; strange and out-of-the-way plants, but withal most interesting and instructive, such as are not often seen at flower shows, were here. The following is a complete list of the constituents of the group, some of which are elsewhere alluded to (p. 401):—

<i>Plants.</i>	<i>Sempervivum urbicum</i>
Agave Baxteri, Baker, sp. n.	Asarum Thunbergii
<i>Amorphophallus variabilis</i>	
<i>Ariseema curvatum</i>	<i>Flowers, &c.</i>
„ <i>helleborifolium</i>	<i>Saraca indica</i> (Jonesia asoc)
„ <i>galeatum</i>	<i>Brownea coccinea</i>
„ <i>præcox</i>	„ <i>grandiceps</i>
„ <i>speciosum</i>	<i>Coffea arabica</i> in berry
„ <i>Leschenaultii</i>	<i>Anthurium digitatum</i>
<i>Begonia</i> ×	<i>Musa coccinea</i>
„ <i>heracleifolia</i> var. <i>longi-</i>	<i>Philodendron Simsii</i>
„ <i>pila</i>	„ <i>sagittifolium</i>
„ <i>incarnata</i> <i>purpurea</i>	„ <i>erubescens</i>
<i>Tillandsia corallina</i>	<i>Spathiphyllum longirostre</i>
<i>Karatis Scheremetieffii</i>	<i>Acaena pubescens</i>
<i>Eugenia myriophylla</i>	„ <i>cutrifloris</i>
<i>Phyllanthus mimosoides</i>	„ <i>falcata</i>
<i>Atomium vittatum</i>	„ <i>præmissa</i>
<i>Calanthe striata</i>	„ <i>verticillata</i>
<i>Sarcocilius usneoides</i>	<i>Strelitzia Nicolai</i>
<i>Maxillaria porphyrostele</i>	<i>Drimys Winteri</i>
<i>Masdevallia Shuttleworthii</i>	<i>Rhododendron nilagiricum</i>
<i>Ardisia polycéphala</i>	„ <i>barbatum</i>
<i>Cœlogyne cristata</i> Lemou-	„ <i>Hookeri</i>
„ <i>iana</i>	„ <i>Thomsoni</i>
<i>Haworthias</i> , 19 sp.	„ <i>argenteum</i>
<i>Pentaterygium rugosum</i>	„ <i>arboresum</i>
<i>Cytisus filipes</i>	<i>Azalea linearifolia</i>
<i>Cereus tuberosus</i>	<i>Araucaria Cunninghamii</i>
<i>Echinæa glomerata</i>	(cone)
<i>Hemitelia Smithii</i>	<i>Gasteria</i>
<i>Synthyris reniformis</i>	<i>Dyckia trigida</i>
<i>Helleborus antiquorum</i>	<i>Grevia Sutherlandii</i>
„ <i>guttatus</i>	<i>Aristolochia Westlandii</i>
„ <i>colchicus</i>	<i>Rhapis humilis</i>
„ var.	<i>Melianthus major</i>
„ <i>orientalis</i>	<i>Calamus trinervis</i>
<i>Douglasia levigata</i>	„ <i>leptosadix</i>
<i>Begonia</i> Arthur Mallet	<i>Richea pandanifolia</i>

The exhibit of Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, S.W., attracted much attention from the visitors. Hyacinths constituted the chief item of the collection, nearly 200 spikes being shown in excellent condition, more sturdy and more dwarf than usual. Some of the most noteworthy of those staged were:—*La Joyeuse*, single, pink; *Ko hi noor*, single, deep blue; *King of the Blues*, ditto; *Charles Dickens*, single, purplish-blue, with white centre; *Garrick*, double, cobalt-blue; and *Criterion*, *Vuurbaak*, *Masterpiece*, *Etna*, *Donna Maria*, &c. (Silver-gilt Banksian Medal.) They also showed two large baskets of *Lachenalia tricolor*, *Rhododendron Early Gem*, of dwarf habit, and bearing many lilac-pink flowers. *Lilium Thompsonianum*, *Trillium discolor* var. *atrata*, *Boronia heterophylla*, a charming plant, as much for its scent as for its pleasing rose flowers; a variegated form of *Rosa microphylla*, with very pretty foliage, useful for decorative purposes.

Messrs. Wm. Paul & Son, Waltham Cross, N., sent twelve boxes of cut blooms of *Camellias*, representing the most popular varieties; *Alba plena* and *Princess Charlotte* were good whites; *Romaniensis*; *flesh*; *Bonomiana*, white flaked red; *Mathotiana*, large and rich red; *Imbricata*, good shaped petals, red. (Silver Banksian Medal.) For a similar but smaller exhibit of unnamed sorts, Mr. S. Ford, Leonardslee, Horsham, received a Bronze Medal.

An excellent variety of white-flowered Lilac Marie Lemoine was shown by Messrs. Paul & Son, Old Nurseries, Cheshunt. Two new varieties were shown, but this was the more compact spike, although *alba grandiflora*, the other one, was equally pure in its white. A number of seedlings, named and unnamed, and of gigantic proportions, came from these nurseries, but few were of pleasing tints. Mrs. Gaskell and Charles Kingley, both crimsions, were the best.

Mr. W. Bull, New Plant Nursery, King's Road, Chelsea, exhibited the very handsome *Hamanthus bicolor*, which should have had a Certificate, but some doubts were expressed as to its persistence. The flower-head is 6 inches in diameter, and is composed of light rose-coloured flowers, with anthers tipped with gold. It is a worthy companion to the vivid *H. coccineus* and *H. Kalbreyeri*.

Daffodils, &c.—*Daffodils*, &c., in pots and cut, were shown largely. Mr. T. S. Ware, Hale Farm Nurseries, Tottenham, received the award of a Silver Banksian Medal for a good collection tastefully arranged with *Palms*, &c. *Narcissus bicolor* *Horsfieldii*, *N. poeticus ornatus*, *N. Golden Spur*, and *N. odorus rugilobus* were prominent. He also showed several species of *Primula*, such as *P. spectabilis*, rosy-lilac with white eye; *P. marginata*, *P. floribunda* with *Anemones*, and a few hardy Orchids.

Messrs. Collins Bros. & Gabriel, Waterloo Road, S., contributed bunches of *Daffodil* blooms, the varieties being *Pallidus præcox* and *Tenby*, good blooms which would have looked better if a little foliage of some sort had been arranged with them. It was stated that the blooms were from the open ground—this probably means in the open ground with the protection of lights or handglasses. A Bronze Medal was awarded here, and also to Messrs. Barr & Sons, Covent Garden, who had a nice lot of *Daffodil* blooms, *Mary Anderson*, *Incomparabilis* *Cynosure*, *maximus*, *odorus*, *Campanelli*, and *grandis*, and the *Polyanthus* sorts, *Grand Monarque* and *Grand Soleil d'Or*, were all good.

Messrs. R. J. Pearson & Sons, Chilwell, Notts, sent a few *Amaryllis* and *Dendrobium crassinode* var. *alba*, pure white, except the throat, which was yellow as usual.

Roses.—*Roses* were very good from Messrs. Paul & Son, Cheshunt, who showed extensively, and received a Silver Banksian Medal. The group included *Beauty of Waltham*, *Lady Mary Fitzwilliam Luciole*, a new sort, yellow, suffused with flesh; *Mignonette*, *Honore Defresne*, *Celestine Pourreaux*, *Duke of Teck*, *Alba rosea*, *Madame Victor Verdier*, Mrs. J. Laing, *Madame Lambert*, *Ulrich Brunner*, Dr. Andry, *Comtesse Camando*, a deep crimson coloured flower, incurved, and of medium size; *Gloire de Polyantha* is a *Polyantha* *Rose*, but with a brighter tint of rose, and a flower perhaps also a trifle larger than the type.

Mr. H. Bennett, Shepperton, Middlesex, contributed some good examples of his *Roses*—*W. F. Bennett*, *Princess Beatrice*, *Lady Mary Fitzwilliam*, and *Polyantha Golden Fairy*—all good formed full flowers.

A Silver Banksian Medal was awarded to Messrs. H. Lane & Son, Great Berkhamstead, for a group of *Roses* and *Deutzia gracilis* in pots, all being heavily flowered plants; the *Roses* included *Glory of Waltham*, *Princess Mary of Cambridge*, *Duke of Albany*, *General Jacqueminot*, which were very good examples of their kind, especially when the size of the pots (9-inch) was considered.

FIRST-CLASS CERTIFICATES.

To Sir T. Lawrence, Bart., M.P., for *Dendrobium crassinode superbum*.

To Messrs. Paul & Son, for Lilac Marie Lemoine.

To Baron Schroder, for *Phalenopsis John Seden*.

To Messrs. Paul & Son, for *Rose Gloire de Polyantha*.

To Sir T. Lawrence, Bart., M.P., for *Spathoglottis Kimballiana*. (The first Certificate granted after leaving South Kensington.)

Fruit Committee.

Present: H. Veitch, Esq., in the chair; Dr. Hogg, J. Lee, P. Crowley, G. T. Miles, W. Marshall, J. Saltmarsh, J. Woodbridge, H. Weir, C. Howe, C.

Ross, W. Warren, T. B. Haywood, G. W. Cummins, J. Cheal, R. D. Blackmore, W. Denning, J. Burnett, J. Smith, J. Wright, J. Roberts, J. Willard, G. Norman, and Sydney Ford.

Messrs. J. Veitch & Sons showed a collection of about forty dishes of Apples which had been well kept. Dumelow's Seedling, Alfriston, Rymer, Northern Greening, Sandringham, Baumann's Red Requette, Prince Albert, Wagoer, and Hanwell Souring were of excellent specimens. A somewhat similar exhibit of about seventy dishes was made by Messrs. Cheal & Son, Crawley. Hambleton Deux Ans, Tower of Glamis, King of the Pippins, Wellington, Blenheim Orange, Annie Elizabeth, and Golden Noble were creditable examples in this collection. In both cases the fruits were clean, plump, and in very good condition.

Mr. M. Dunn, Dalkeith Gardens, also sent a few Apples from the north country.

Mr. W. Roupell, Harvey Lodge, Roupell Park, S.E., showed excellent fruits of the following Apples:—Wellington, London, and Lane's Prince Albert.

A new Apple, named Newton Wonder, came from Messrs. J. R. Pearson. It is a pretty fruit, conical, yellow, with red cheek, and about 3 inches high.

John Apple was sent from the Society's Gardens, at Chiswick. This is a splendid little Apple, which, even at this date, is as good as when first gathered, having still its brisk flavour and solid flesh.

Two bunches of Lady Downe's Seedling Grape were exhibited by Mr. G. Norman, Hatfield House Gardens, Hatfield. They were first-class fruits, plump, good colour, and still bore the bloom unharmed.

Samples of Hungarian Grapes were shown from Herr Anton Horvath, Fünfkirchen, Hungary. They were Chasselas Violet, Royal Muscadine, and Muscat of Hungary, which, although of but poor appearance, had very fine flavour. Mr. Blair, gr., Trentham, sent a bunch of black Hamburg grapes, cut on January 18 last.

CRYSTAL PALACE.

MARCH 24.—The spring flower show held on this date was a fair display, but the competition in many classes was very slack. Bulbous plants were good, and of these Messrs. H. Williams & Sons, Fortis Green, Finchley, N., contributed the best collections of Hyacinths, Tulips, and Lily of the Valley, in the open classes, showing vigorous specimens, especially of Lily of the Valley. Mr. H. R. Wright, Lee, Kent, was also a successful exhibitor in the same classes, leading for twenty-four Narcissi in pots.

Mr. Penfold, gr. to Rev. Canon Bridges, Beddington, Surrey; and Mr. C. J. Salter, gr. to C. J. Southgate, Esq., Streatham, carried off the honours in the amateurs' division for all but Lily of the Valley, where Mr. W. Kemp, gr. to H. Barry, Esq., Winchmore Hill, N., was 1st. He also sent a capitally flowered collection of *Primula sinensis* vars.

Mr. D. Phillips, Langley Broom, Slough, showed creditable examples of Cinerarias, staging plaots of good form, and well flowered, the corresponding place in the open class being taken by fine plants from Mr. J. May, Gordon Nursery, Twickenham, followed closely by Mr. J. Odell, of Twickenham, who also contributed a collection of 100 pots, showing good culture, the flowers being very bright in colour, and of fine substance. Mr. Hibbert, Kingston-on-Thames, staged a similar group.

But few *Amaryllis* were shown, Messrs. Paul & Son, The Old Nurseries, Cheshant, however, having some capital plants with good broad segments, and of rich colour: Dr. Masters was specially attractive. Mr. Salter also took a prize for these plants, having fair samples.

Greenhouse Azaleas from Mr. R. Wells, Longton Nursery, Sydenham, S.E., were very good, although small; President Garfield, E. H. Brandt, Bijou de Paris, Souvenir de A. Veitch, and Madame Vander-cruyssen, were the best varieties.

For a collection of stove and greenhouse plants in 100 square feet, Messrs. J. Laing & Sons, Forest Hill, S.E., received the premier award for a very neat and light arrangement of plants, Mr. James, Castle Nursery, West Norwood, was a good 2d, showing *Orchids* well.

Among miscellaneous exhibits were collections of *Narcissi*, &c., from Mr. T. S. Ware, Tottenham; and from Messrs. Barr & Son, Covent Garden. *Narcissus Johnstoni* and *N. incomparabilis Cynosure* were specially noticeable in Messrs. Barr's collection, and *N. poeticus ornatus* in Mr. Ware's. A few alpine were sent by Mr. Waine, and an interesting collec-

tion from Messrs. Paul & Son, comprising *Saxifragas* and *Anemones*, &c. These last-named exhibitors also contributed a capital group of *Roses*, in which were *Souvenir d'un Ami*, *Victor Verdier*, *The Puritan*, and *Lady Alice*, and also *Polyanth* *Roses*. Messrs. W. Paul & Son, Waltham Cross, N., showed twelve boxes of *Camellia* blooms, a very fair selection being given. *Alba plena*, *Imbricata*, *Princess Charlotte*, and *C. M. Hovey* were fine varieties.

A large collection of bulbous plants was sent by Mr. B. S. Williams, Upper Holloway, N., comprising most of the popular varieties. *Azalea Deutsche Perle* from this exhibitor was a well flowered plant; there were also hybrids between the *A. amœna* and *A. indica* section—very pretty.

Begonias were sent from Messrs. H. Cannell & Sons, Swanley, Kent—*Carrière* is a good white; and Messrs. Cannell contributed also trusses of *Pelargoniums*, which were remarkably fine.

From Messrs. H. Williams & Sons there came a group of flowering plants, of which *Azaleas*, *Cinerarias*, *Primulas*, and bulbs were the chief; the whole effect was very vivid—almost too much so.

A *Cineraria* of a magenta hue, with the rays quilled for half their length, and expanded at the apex, was sent by Messrs. J. Carter & Co., High Holborn, W.C., as *Emperor Frederick*: appears to be the same as was certificated at the Royal Horticultural Society on April 12 last year as *Alexander Warwick*.

PRESTON AND FULWOOD.

MARCH 21 AND 22.—The spring show of this Society was held on the above dates, and in every respect was a success. Flowering plants were more numerous than usual, and were well banked up with plants having fine and ornamental foliage. The bulbs, as a whole, were good; many of the *Hyacinths* were of excellent quality, although a few, especially in the doubles, were a little lengthened in the spike. J. B. Dixon, Esq., Ashton (gr., Mr. Sharples), staged a large lot of bulbs, carrying off 1st in almost every class. Amongst his single *Hyacinths* we noticed good spikes of *Queen of the Blues*, *Lord Derby*, *Obelisk*, *Linnæus*, *Marchioness of Lorne*, *La Neige*, *Garibaldi*, *Sir H. Bartley*, *Sultan*, and *Black Prince*. Some fine spikes were also observable among the doubles, including *Van Hooboken*, *Noble par Merite*, *Regina Victoria*, *La Tour d'Auvergne*, *Prince of Waterloo*, *Comtesse de St. Prieste*, *Grand Conquerante*, and *Goethe*. *Tulips*, *Narcissus*, *Lily of the Valley*, were shown by the same exhibitor, and of excellent quality.

In the class for twelve single *Hyacinths* Mr. R. Smith, Longridge, beat Mr. Dixon—the only one in some sixteen classes where the latter failed to secure premier honours.

Mr. E. Payne and Mr. H. Winwood competed in the nurserymen's class, the former taking 1st prize in both classes of twenty-four singles and twenty-four doubles.

The nurserymen's groups of miscellaneous plants were a pleasant feature, Mr. E. Payne, Mr. W. Troughton, and Mr. H. Winwood, staging good groups; that of Mr. Payne was of a very distinct and pleasing character. The awards were made in the order in which they appear. J. B. Dixon, Esq., the *Misses Ffarrington* (gr., R. Frisby), Mrs. Birchall (gr., J. Clarke) showed good groups of flowering and foliage plants. In the latter collection was a fine form of *Clivea miniata*. Mr. Dixon staged three grand *Deutzia gracilis*, full of bloom, measuring 15 feet in circumference. Some well-bloomed standard *Azaleas* were shown, also standard and dwarf *Roses* in pots capitally flowered. The *Cyclamens* shown by Mr. H. Wilding and Mr. J. Atherton were full of large flowers. *Spiræas* and *Dielytras* were also in fine condition. There were numerous *Ferns* staged, among which were good pieces of *Microlepia hirta cristata*, *Adiantum cardiochloa* and *A. Williamsii*. *Primulas* and *Cinerarias* had travelled badly, and were scarcely up to the mark. Among the latter were some having very large blooms of good colour and substance. Table plants were a nice feature. The *Orchids* were small and few, among them being *Cypripedium villosum*, *Odontoglossum Pescatorei maculatum*, *D. noble*, *Wardianum*, *Cælogyne cristata*, and *Cattleya Trianae*. Mrs. Birchall, C. Parker, and T. R. Taylor were successful in these classes. Mr. C. Parker was 1st with bouquets, and vase and baskets of flowers. A fine group of flowering and foliage plants was staged by Mr. G. Rowbotham, Curator of the Preston Park; large *Prunus sinensis* fl.-pl., *Deutzias*, *Ficus elastica*, *Rhododendrons*, *Cinerarias*, and bulbs. Messrs. Dickson, Brown & Tait, Man-

chester, exhibited fifty pots of *Hyacinths* splendidly grown and flowered in 5-inch pots; the colour of the flowers and the dense manner in which the blooms appeared on the spikes were much commented on.

TREES AND SHRUBS.

ORNAMENTAL OAKS.

THE employment of late years of coniferous trees has caused planters to overlook the merits of many beautiful deciduous subjects. Some of the American Oaks are unusually large trees, and so distinct in leaf and general appearance that it may be of use for me to specify a few of the more suitable species for landscape embellishment.

Quercus coccinea.—Perhaps, with the exception of the Turkey and evergreen Oaks, this beautiful tree is more plentiful in Great Britain than any other. The leaves are large, often nearly a foot in length, deeply lobed, and during the autumn months they turn to a bright scarlet, and at which time the tree becomes highly ornamental, if found in conjunction with a clump of Austrian Pines. It delights in a cool, rich loam, and where sunshine is freely admitted. There is a form of the scarlet Oak named *macrophylla*, which is of very free growth, and quite distinct from the typical plant.

Q. Daimio, in point of beauty and singularity of form, is well worthy the attention of planters, but it is yet scarce, and rarely seen outside the bounds of botanic gardens or nurseries. The leaves of this Japanese Oak are of enormous size, those on the English-grown specimen being 15 inches in length by 9 inches in width. The colour of the leaf during autumn is very conspicuous and highly ornamental, it being of an amber colour suffused with red, while the foot-stalk and midrib are traversed by purplish veins. The young leaves are somewhat downy, but this gradually disappears with age, until they become quite smooth, although the foot-stalks and young twigs are always more or less pubescent. In this country—even in the cold parts of Scotland—it is perfectly hardy. It usually grows with great luxuriance when planted in rich well-drained soils.

Q. pannonica or *conferta*.—When well grown it is a tree of great beauty, of quick growth, and furnished with large and handsome foliage. In the stage of decay this is of a pleasant yellowish-brown colour, and as they remain hanging for a long time, the tree during the autumn months is one of great beauty. It may be relied upon as being perfectly hardy; indeed some of the largest and finest trees in the country are to be seen in the environs of Edinburgh. It would seem to thrive in a damp situation, at least the Irish specimen to which we have alluded is growing in rather dampish loam. It will grow in a soil almost hoggly.

Q. Mirbecki is another little known but pretty Oak, and one that is of value for its autumn effects. It is a native of Algeria, but has been found perfectly well suited for the climate of Southern England at least; but whether it will withstand the rigours of a Scottish winter we know not. Perhaps as it is a tree of unusual beauty, some correspondent of the *Gardeners' Chronicle* would tell us how it succeeds in the northern Scottish counties. The leaves are large and of great substance, fully 9 inches long, and deeply and sharply lobed.

The Marsh Oak (*Q. palustris*) is in this country represented by some very fine specimens, and is a tree of very rapid growth, and of the easiest culture. As its name denotes, it delights to grow where moisture is abundant, and for this reason the banks of streams or lakes constitute a suitable position for it. In America it is usually found in the wild state, in best form, in such situations as we describe, some of the largest trees being found on the banks of Lake Erie and the Detroit River. By the name of Pin Oak the tree in question is sometimes known, and appropriately, too, for when leafless, the numerous smooth, slender shoots, give it the appearance of being provided with pin-. The leaves, which in fully deve-

loped specimens are about 7 inches long, and deeply sinuated, turn in autumn of a bright and pleasant yellowish-red.

Quercus acuta, or *Q. marginata*, is an evergreen species, and when seen in good form it is certainly highly ornamental; indeed, quite as much so as any of its Japanese brethren. The leathery dark green leaves are of unusual substance, and remain in a good state of preservation for several weeks after being removed from the tree. Being perfectly hardy it may well find a place amongst the more ornamental of its race. There are several well marked forms of this Oak, one of the best, in our opinion, being that named *robusta*, the fully developed foliage of which is not unfrequently 8 inches in length by fully 3 inches in width, and puts one in mind of that of *Magnolia grandiflora*.

Q. serrata might readily—so far, at least, as shape of foliage is concerned—be mistaken for the Spanish Chestnut. The leaves are fully 6 inches long by an inch wide, and deeply dentated, and when young are often covered with a silky down. From its distinct appearance and ornamental qualities, this Japanese Oak is well worthy of extended culture; and as it attains to a large size, producing excellent timber, and is perfectly hardy, it may be relied upon as in every way suitable for planting in our parks and grounds.

The Evergreen Oak (*Q. ilex*) must on no account be omitted from our list of ornamental Oaks; indeed, it is not only one of the handsomest, but perhaps the hardiest and most accommodating that has yet been introduced to this country. There is a form—and a fairly constant one, too—of the Evergreen Oak that, in our opinion, is even better suited for ornamental purposes than the parent, and from which it differs chiefly in the more compact and graceful outline, smaller and much narrower leaves, and brighter colour. It is known under the name of *Q. ilex Fordi*. *A. D. Webster.*

GARRYA ELLIPTICA.

There seems to be a prevalent idea that this handsome evergreen shrub, which at this season is always a good deal talked about, is tender, and that it requires wall protection, and not infrequently writers who should know better describe it as a tender shrub. It is of course well known to many that it may be grown in the shrubbery like the common *Arbutus*; and what I wish to point out is its beauty of growth when planted in good loamy soil, and allowed plenty of room to develop itself. In a dry, light soil it has the best chance of withstanding a very severe winter. It is not suggested that it does not make a beautiful wall covering—there could be scarcely anything better: but I should like to see it planted more plentifully in the open. The female variety, whose catkins have no great beauty, appears to be becoming much commoner than formerly, though I would always prefer the male or pollen-bearer, as the catkins are longer and more elegant. I should like to ascertain how far north it is safe to plant the *Garrya* as a standard, especially in inland districts. *W. G.*

LAW NOTES.

ACTION FOR DAMAGES BY A FARMER.

BURRILL v. JENNISON.—This action was brought by a farmer residing at Whinhill, near Driffield, to recover £30 damages of defendant, a seed merchant, at Frodingham, caused by a quantity of Bangholme Purple-top Swede Turnip seed producing about three-fourths of a crop other than Turnips. The entire crop was useless, and entailed a loss of £8 to £10 per acre, besides causing a deterioration of the land during the next three or four years. Some of the growths from the seed were produced in court, and whilst they had the pungency of a Swede-Turnip they had no bulb, but an enormous number of threads or roots, one witness describing them as strongly resembling a Gooseberry bush, another as an Ash tree! Mr. Brigham's defence was that not only was

the land on which the seeds had been sown unsuitable, but they had been sown late, and that the exceptionally severe drought of last year had caused the seed to "sport," or in other words to go back to the original plant from which the Turnip is developed. In support of this theory he called a number of witnesses who had purchased seed of the same kind from defendant, and who had not a single complaint to lay against it. Mr. Syme, manager for Messrs. Peter Lawson & Son, of Edinburgh, growers of the seed, deposed that of this particular lot they sold last season 102½ bushels, and received no complaints. He considered the plants produced were either a "sport" or had been hybridised, but they were not Rape plants. There was a trace of the Swede in them. In England last season was one of the worst known for Turnips; in Scotland it was not so bad. Mr. Reed, who said he farmed 1000 acres, stated that land such as Mr. Burrill's was liable to grow the sort of plant produced, the land containing a good deal of antediluvian deposit. Other witnesses deposed to land in the parish of Frodingham—"carr" land—producing such plants as those exhibited in court.

His Honour gave judgment for defendant, and with costs, observing that the plaintiff had enormous difficulties against him, and he had entirely failed to prove that defendant had sold him something different to what he had bargained for. *East Riding Chronicle and Driffield Express, March 21.*

NOTICES TO CORRESPONDENTS.

INTELLIGENT READERS, do PLEASE NOTE that letters relating to ADVERTISEMENTS, or to the supply of the Paper, should be addressed to the PUBLISHER, and that all communications intended for publication, as well as specimens and plants for naming, should be addressed to the EDITOR. Such communications should be written on one side only of the paper, and sent as early in the week as possible. Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

ANTHURUM: *Westfield.* Destroy that part of the plant which is affected.

APPLES AND PEARS: *B. H.* The fruits have lost their characteristics, and cannot now be identified.

AZALEAS: *E. P.* Most of the varieties of Indian Azaleas grow freely when properly treated. *Azalea indica purpurea*, a fine old plant with large light purple flowers, is one of the strongest growers, and is therefore much employed as a stock. Make your own selection.

CHRYSANTHEMUMS: *A. E. S.* These plants must have the flower-stems cut down, whether in pots or out-of-doors. To get plants of 18 inches in height you might employ the method of summer layering in the open ground, for either bushes or standards, choosing shoots of rather less than that height; or you may cut down the stems of plants in pots in the month of June to about 9 inches. But as the varieties, as well as individual plants, show differing degrees of vigour, it will not be possible to maintain the 18 inch standard, consequently many more must be grown than you want, so that a selection may be made when in bloom.

CHELOZYNE CRISTATA PSEUDOBULBS SHRIVELLING: *F. G. F.* If the plant is free from maggot you need not feel alarmed at the pseudobulbs shrivelling. They always do this more or less after flowering, especially the white variety, *C. hololeuca*; but when placed in a temperature of 60°—70° they soon start to grow, and then plump up again.

GAS LIME: *E. P.* This substance is best employed either mixed with manure in heaps that are repeatedly turned over before being spread on the land, or it may be spread alone, and allowed to weather before turning in.

KEW GARDENS: *A. H.* Write to the Curator, who will send you a form of application.

LEAF DISFIGURED: *F. S. M.* See report of Scientific Committee.

LIMEY WATER: *P. & Sons.* Heaths, Rhododendrons,

Azaleas, and peat-loving hard-wood plants generally, suffer from water containing lime, and the leaves of Orchids and evergreens get disfigured by being syringed with it.

MUSCARD AND CRESS DAMPING OFF: *H. F.* Bad ventilation; too much heat and moisture, or want of light.

NAMES OF PLANTS: *L. P.* 4, *Acacia Riceana*; 5, *A. longifolia*, 6, *A. stricta*? 7, *A. sp.*—cannot determine name; 11, *Dorstenia brasiliensis*?—*W. T. P.* *Dendrobium thyrseiferum*, *Odontoglossum crispum guttatum*.—*D. M. L.* 1, *Vanda tricolor*; 2, *Dendrobium chrysotoxum*; 3, *D. heterocarpum philippense*; 4, *D. densiflorum*; 5, *D. Wardianum*.—*F. G.* *Begonia argyrostigma*, certainly different from *B. Lubbersi*, and not so good.—*M. L. D.* 1, *Oncidium sphacelatum*; 2, *Dendrobium draconis*; 3, *Polygala Dalmaissiana*.—*A. B.* *Tradescantia repens*.—*W. G.* 1, see next week; 2, *Pelargonium Rollinsoni* Unique; 3, *Agapanthus variegatus*; 4, *Calanthe masuca*; 5, *Begonia nitida*.—*J. H. J.* 1, *Begonia nitida rosea*; 2, *B. Ingrami*; 3, *Eupatorium Weimanniana*; 4, *Salvia gesneriflora*; 5, *Goldfussia isophylla*.—*Sent Without a Name.* *Asplenium cicutarium*.

ODONTOGLOSSUM ROSSI RUBESCENS: *J. C.* Many thanks.

STRAWBERRIES: *J. M.* Too much damaged to identify.

TACSONIA ERIANTHA: *Eriantha.* When this plant is shy to bloom it is usually the result of a deficiency of ventilation, and of keeping the plant growing, instead of causing a cessation of growth by cooler treatment and lessened water supply in autumn and winter.

TREE TOMATO: *T. G. C.* It is not hardy in this country, and is not worth cultivating as a vegetable, as we have so many better things.

Correspondents sending plants or fruits to be named, or asking questions demanding time and research for their solution, must not expect to obtain an answer to their enquiries in the current week.

MARKETS.

COVENT GARDEN, March 28.

[We cannot accept any editorial responsibility for the subjoined reports, which, however, are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations represent averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and they fluctuate, not only from day to day, but often several times in one day, and therefore the prices quoted as averages for the past week must not be taken as indicating the particular prices at any particular date, and still less can they be taken as guides to the prices in the coming week. Ed.]

No alteration. Market still very quiet. *James Webber, Wholesale Apple Market.*

SEEDS.

LONDON: March 26. — Messrs. John Shaw & Sons, seed merchants, of 37, Mark Lane, E.C., report more business now doing. In accordance with the prevailing fashion, buyers appear desirous of postponing their purchases as long as possible. However, with a spell of favourable weather, the sowing season must be quickly upon us, and the comparatively small stocks on hand would quickly melt away. As regards values there is no change to be noted. Quotations remain very moderate all along the line. Spring Tares find buyers on former terms. Perennial and Italian Rye-grasses move off at last week's rates. There is still a scarcity of Hemp seed. For Canary seed the sale is slow. Blue Peas are neglected. In Linseed the tendency is upwards. Rape seed is also firmer.

CORN.

Averages.—Official statement showing the average price of British corn, imperial measure, in the week ended March 24:—Wheat, 30s. 6d.; Barley, 29s. 6d.; Oats, 15s. 5d. For the corresponding week in 1887:—Wheat, 33s. 2d.; Barley, 23s. 2d.; Oats, 16s. 4d.

POTATOS.

BOROUGH AND SPITALFIELDS: March 27.—A fair demand. Prices generally firm. Quotations:—Regents, 50s. to 100s.; Magnum Bonums, 50s. to 105s.; Champions, 50s. to 70s.; Dutch Rocks, 55s. to 60s. per ton.

Imports.—The imports into London last week consisted of 188 bags from Boulogne, 574 from Bremen, 100 from Harlingen, 6 from Rotterdam, 600 bags 10 cases from Hamburg, 100 casks from Malta, 6 baskets 44 packages from Dunkirk, 82 packages 47 barrels from Teneriffe, 6 barrels from New York.

CARNATIONS AND PICOTEEES. (PLANT AT ONCE.)

I have pleasure in drawing the attention of the Trade and Retail Buyers to my very extensive stock of Carnations and Picotees, which is probably the largest collection in the Trade. The plants this season are strong and healthy, and intending buyers would do well to procure and plant at once, that they may get well established before the warm weather comes.

The Collection consists of the following sections:—**SHOW VARIETIES.**

A very complete collection, including all the finest of the Florists' sorts, especially those which are of good constitution.

BORDER VARIETIES (to name). These have for many years been a great speciality with me. An enormous quantity of them are sold annually. They are all good free vigorous sorts, and such as produce plenty of flower, and are, in consequence, specially suited for the Trade who want quantities of Carnations for cutting.

SELFS AND CLOVES. A very fine collection, including many varieties of recent introduction. These are specially adapted for border planting; they are mostly all good free flowering, distinct, and bright-coloured sorts. Many of them are strongly Clove-scented.

YELLOW GROUNDS. A unique collection, which has been materially extended during the last two seasons, and there are now included amongst them many sorts which are as free, both in growth and flower, as the Border varieties, or the Selfs and Cloves, and are, in consequence, well fitted for outdoor planting, and charmingly suited for the purpose of supplying cut flowers.

CATALOGUES, with full descriptions and prices of the varieties which constitute the various collections, may be had, gratuitously and post-free, upon application to

WORCESTER.

DANIELS' ROYAL NORFOLK RUSSET.

SYN.—"The Village Blacksmith."

THE most REMARKABLE POTATO ever raised. The tubers are of medium size, and roughly netted; eyes, few and shallow; flesh, white; fine grained; boils like a ball of flour, and of the finest flavour. It is a great disease resister, and is pre-eminently adapted to moist soils and districts. We have grown it six or seven seasons, and have never known one diseased.

Price, 3s. 6d., 14 lb.; 12s. 6d., 56 lb.; 21s. per cwt. Orders for 1 cwt. and upwards carriage paid.

UNSOLICITED TESTIMONIALS.
IRELAND.—J. JONES, Esq., M.D., Ardee, September 5.—"In 1885 I had from you 1 lb. of Royal Norfolk Russet. I planted the produce in 1886, and again this season. On the 3rd inst. I dug from two stalks forty-one tubers about 14 lb. Such as were cooked were excellent, white, floury, and of good flavour."

ENGLAND.—From Mr. T. R. Bailly, Barrington, Camb.—"Your Royal Norfolk Russet greatly exceeded my expectations, turning out remarkably well."

SOUTH AFRICA.—From Mrs. Francis, Pietermaritzburg.—"The Potatoes gained first prize as a collection. The Royal Norfolk Russet first as a round variety."

A CHANGE OF SEED ALWAYS PAYS.

Before ordering your supply send for Daniels' Illustrated Potato Catalogue, containing valuable hints on the Potato, with descriptions of nearly 200 kinds, and the latest Novelties. Gratis and Post-free to all applicants.

BIDDLES & CO., THE PENNY PACKET SEED COMPANY, LOUGHBOROUGH, LEICESTERSHIRE.

ORCHIDS.

An Immense Stock of recently imported plants compels a sale of the established plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained and great bargains. See public Journals for high prices recently obtained. The Special Offer affords a paying investment to anyone with glass at command, which should not be overlooked; such plants may never again be offered to the public and the trade.

Lilium auratum.—Eighth arrival of 10,000 Bulbs, the best that money can buy anywhere, 4s., 8s., and 10s. per dozen. Specially imported Non Plus Ultra bulbs, 2s. 6d. each; very liberal allowance to the Trade.

Lilium album Krætzleri.—The most lovely white Lily grown; throws seven to ten flowers, which sell in market at 2s. per dozen; beautiful and rare, 1s. each, 10s. per dozen.

Lilium speciosum rubrum cruentum.—The dark form of this lovely Lily, most exquisitely marked, 1s. each, 10s. per dozen.

Lilium auratum, platyphyllum, rubro-vittatum, crimson, striped with gold; **virginale,** pure white, and spotted, with gold band. All these lovely new and distinct forms of auratum, suitable for show purposes, very fine bulbs, 5s. each.

Lilium Harrisii, 10s. per dozen; and all other Lilies equally cheap. **Banksian Silver Medal** awarded August, 1887. **Japanese Novelties**—80 varieties Iris, Tree Peonies, Maples, Camellias, Azaleas. Please apply for special offer to

W. GORDON,

THE NURSERIES, AMYAND PARK ROAD, TWICKENHAM, MIDDLESEX.

Extra Strong Fruiting Vines. **H. LANE AND SON** can still offer well-ripened extra strong Canes for Fruiting in Pots—Black Hamburg, Lady Downe's, Alicante, Mrs. Pince, Foster's Seedling, Gros Colmar, Alnwick, Gros Maroc, &c., and Planting Canes. The Nurseries, Berkhamsted, Herts.

100 Herbaceous and Alpine Plants for 25s. **RICHARD SMITH AND CO.'S** selection as above contains a most interesting and valuable assortment of beautiful and Hardy Plants for the Border or Rock-work, which produce flowers and render the garden attractive all through the year. New LIST of sixty-four pages Free. **RICHARD SMITH AND CO.,** Nurserymen and Seed Merchants, Worcester.

STRONG FOREST TREES.

ALDER, 1½ to 2, 2 to 3, 3 to 4, and 4 to 5 feet. **ASH,** 1½ to 2, 2 to 3, and 3 to 4 feet. **BIRCH,** 1½ to 2, 2 to 3, 3 to 4, and 4 to 5 feet. **ELM,** Wych, 2 to 3, 3 to 4, and 4 to 5 feet. **LARCH,** 2 to 3, 3 to 4, and 4 to 5 feet. **OAKS,** 1½ to 2, 2 to 3, and 3 to 4 feet. **FIR, Scotch,** 1½ to 2, 2 to 3, and 3 to 4 feet. **FIR, Spruce,** 1½ to 2, 2 to 3, 3 to 4, and 4 to 5 ft. All these are stout, good plants, and properly rooted. The prices quoted will be very reasonable in order to clear. Apply to **JOHN HILL,** Spot Acre Nurseries, near Stone, Staffordshire.

SIMPLE INSTRUCTIONS by which an abundance can be insured of delicious MUSHROOMS. See Seed LIST, Free. **RICHARD SMITH AND CO.,** Seed Merchants and Nurserymen, Worcester.

To the Trade.

Home-grown VEGETABLE and FIELD SEEDS. **H. AND F. SHARPE** are now prepared to make special offers of their fine selected stocks of VEGETABLE and FIELD SEEDS, all of which they have harvested in splendid condition. The prices will be found very advantageous to purchasers. Seed Growing Establishment, Wisbech.

JENSEN'S

Every grain fertilizes because the Guano is perfectly pure. It is most economical, one part of Manure to 100 parts of soil being ample for garden use.

FISH-POTASH

FISH-POTASH contains Ammonia, Phosphates and Potash in large proportions, which are the principal elements of fertilization.

GUANO.

GUANO—2-lb. Tins, 1s.; in Bags, 7 lbs., 2s.; 14 lbs., 4s.; 28 lbs., 6s. 6d.; 56 lbs., 10s. 6d.; 1 cwt., 16s.; 2 cwt., 30s. Special terms for larger quantities. Analysis guaranteed.

J. JENSEN & CO. LIMITED, 109, Fenchurch Street, London, E.C.

STANDEN'S MANURE.

Established over 30 years.

THIS OLD-ESTABLISHED MANURE is acknowledged by most of the leading practical Gardeners in the United Kingdom and the Colonies to exceed all others in general fertilising properties and staying powers. It promotes a rapid, healthy, and robust growth to plants generally. It is a clean and dry powder, with very little smell, which renders it particularly adaptable for ladies interested in plant culture.

TESTIMONIAL FROM AMERICA.

"We have used STANDEN'S MANURE for some years, and have never found any fertiliser so safe and valuable. Its action is literally 'magical.' We have tried it on unhealthy plants which seemed past recovery, and it has restored them to their natural vigour. However valuable other fertilisers may be, none can be compared to this. Camellias grown in the same pots for 10 years are as healthy as if just repotted.—C. M. HOVEY, Boston, U.S.A., May 27, 1887."

Sold in TINS, 1s., 2s. 6d., 5s. 6d., and 10s. 6d. each; and in KEGS, at reduced prices, 28 lb., 12s. 6d.; 56 lb., 23s.; 112 lb., 42s. each.

May be obtained from all Nurserymen and Seedsmen in the United Kingdom and the Colonies.

SOLE MANUFACTURERS—

CORRY, SOPER, FOWLER & CO. (LIMITED), FINSBURY STREET, LONDON, E.C.

To Market Gardeners, &c.

To Grow fine Vegetables and Flowers, Gardeners should use **SULPHATE OF AMMONIA.** One trial will prove the great value of this Manure, and ensure its constant use hereafter. It can be applied either separately or mixed with ordinary stable or farmyard manure. Rose Trees and Garden Plants are much benefited by being watered with a weak solution once or twice a week. Instructions on application, post-free. Price free on rail at Sheffield, 13s. per cwt., or 7s. per 56 lb. P.O. Orders payable to The MANAGER, Sheffield Gas Company, Sheffield.

BOXES.—Light Wood Boxes for sending B Plants and Cut Flowers through the Post. Wreath, Cross, and Bouquet Boxes. Propagating Trays for Sowing Seed, Striking Cuttings, &c. Sample and Price List Free, 6 stamps.—T. CASBON, Box-maker, Peterborough.

THE MOST SUITABLE FOR SHADING ORCHIDS, FERNS, Palms, and Stove and GREENHOUSE PLANTS. It is a strong, durable Cotton Netting, woven in squares so close as to exclude the direct rays of the sun, but admitting the greatest amount of light obtainable through shading. It withstands the weather better than any other class of Shading, and may be beneficially used on account of the thickness of its texture, during cold weather, to keep the frost out. The leading Orchard and Plant Growers in the country have used this material for some years, and speak very highly of it, pronouncing it to be the very best material for Plants they have ever used. Blinds made up and fixed complete. Sold in pieces, 30 yards long by 1 1/2 yard wide. Price 4/6 each. Samples submitted gratis. B. S. WILLIAMS, VICTORIA and PARADISE NURSERIES, UPPER HOLLOWAY, LONDON, N.

RAFFIA (Fresh Arrival). FOR PRICE LIST & PARTICULARS ADDRESS—BENJAMIN EDGINGTON, 2 DUKE ST. LONDON BRIDGE

WANTED, a young UNDER GARDENER, married, without children. House provided. Man to attend Conservatory, and must be a good Plant Grower, active and neat in his work. Wages, 16s.; 5s. a week to wife for partial service during summer months. Apply by letter or personally to HEAD GARDENER, Rosherville Gardens, Gravesend.

Can any Gentleman recommend a **COACHMAN-GARDENER**, married, with small or no family? Small Vinery. Pair.—Rev. E. ELWES, Over Combe, Liss.

WANTED, a Working NURSERY FOREMAN and PROPAGATOR (Outside), where a General Stock is grown. Must be active and intelligent, a good Budder and Grafter, and understand the Propagation of General Nursery Stock.—Apply in own handwriting, stating wages expected to **GEORGE SMITH,** Dell Nursery, Kock Ferry, Birkenhead.

WANTED, several respectable MEN in the JOBBING Department; also a few YOUNG MEN for the FURNISHING Department.

Apply personally, or by letter to **WILLS AND SEGAR,** Florists and Gardeners by Royal Warrants to Her Majesty the Queen and H.R.H. the Prince of Wales, South Kensington, London, S.W.

WANTED, a TRAVELLER, for the Nursery and Seed Trade. Must be thoroughly competent, with a good connection, and be energetic, sober, and trustworthy.—Apply by letter only, stating experience, wages expected, &c., to X. Y. Z., *Gardeners' Chronicle* Office, 41, Wellington Street, Strand, W.C.

WANTED, a young LADY FLORIST. Permanency.—Mrs. TAYLOR, Stephenson Place, Birmingham.

WANT PLACES.

Letters addressed "Poste Restante" to initials or to fictitious names are not forwarded, but are at once returned to the writers.

NOTICE TO ADVERTISERS.—In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisement which they wish repeated.

POSTAL ORDERS.—To Advertisers, Subscribers, and Others.—It is very important in Remitting by Postal Order that it should be filled in payable to No. 42, DRURY LANE, to W. RICHARDS, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by **POST-OFFICE ORDER.**

SCOTCH GARDENERS. SCOTCH DOWNIE (of the late firm of Downie & Laird), Seedsman, 144, Princes Street, Edinburgh, has at present on his List a number of **SCOTCH GARDENERS,** waiting re-engagements. He will be pleased to supply full particulars to any Lady, Nobleman, or Gentleman requiring a trustworthy and competent Gardener.

RICHARD SMITH AND CO. beg to announce that they are constantly receiving applications from Gardeners, seeking situations, and that they will be able to supply any Lady or Gentleman with particulars, &c.—St. John's Nurseries, Worcester.

Gardeners, Bailiffs, &c.

JOHN LAING AND SONS, having filled many important places, can RECOMMEND with every confidence, energetic and practical MEN of tested ability and first-rate character. Ladies and Gentlemen in want of Gardeners and Bailiffs, or Gardeners for first-rate establishments, or Single-headed situations, can be suited, and have full particulars by applying to us. No fees charged.—**JOHN LAING AND SONS,** The Nurseries, Forest Hill, S.E.

E. P. DIXON AND SONS, Hull, can RECOMMEND a few competent **HEAD GARDENERS, FOREMEN,** and JOURNEYMEN, and will be glad to give full particulars to any Lady or Gentleman requiring the same.

GARDENER (HEAD); married, no family.—The Countess of SELKIRK wishes to recommend George Ormiston, her late Gardener, who lived at St. Mary's Isle nearly seven years' and left there only in consequence of the Earl of Selkirk's death. Reference, the Countess of Selkirk, 50, Berkeley Square, W.—Address, W. ORMISTON, 113, Harwood Road, Fulham, S.W.

TO FLORISTS.—Situation wanted by a young man as Assistant. Advertiser has a fair knowledge of his work, but being anxious to be in a good London business would take small salary.—**W. B.,** 28, Acklam Road, North Kensington, London, W.

TO SEEDSMEN or SEED and IMPLEMENT MERCHANTS.—Wanted, situation, by a man of experience. First-class testimonials and references.—**C. L.,** Hill View, Ballynouty, Thurles.

HOLLOWAY'S PILLS.—Any dyspeptic sufferer, aware of the purifying, regulating, and gently aperient powers of these Pills, should permit no one to cloud his judgment or to warp his course. With a box of Holloway's Pills, and attention to its accompanying "Directions," he may feel thoroughly satisfied that he can safely and effectually release himself from his miseries without impairing his appetite or weakening his digestion. This most excellent medicine acts as a nerve and bodily tonic, by aiding nutrition, and banishes a thousand annoying forms of nervous complaints. An occasional resort to Holloway's remedy will prove highly salutary to all persons, whether well or ill, whose digestion is slow or imperfect, a condition usually evidenced by weariness, languor, listlessness, and despondency.

He won't be happier till he gets it!

SALES BY AUCTION.

Wednesday next.—(Sale No. 7659.)

SPECIAL SALE OF ORCHIDS IN FLOWER and BUD. MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, April 11, at half-past 12 o'clock precisely, a grand Collection of ORCHIDS in Flower and Bud comprising two fine pieces of Lycaste Skinneri; alba, Odontoglossum Alexandræ and Pescatorei, splendid forms; O. Vexillarium, extra fine plants, one with thirty growths; O. Mulus var., fine Odontoglossum Hybrids, some splendid varieties of Cattleya Mendellii, &c. Trauce, Dendrobium splendidissimum grandiflora, D. Wardianum, D. Devonianum, Lælia Harpophylla giganteum, fine forms of L. Anceps, and L. purpurata. Cymbidium eburneum, Cypripedium caudatum, ro-eam, Masdevallias, Oncidiums, &c.

On view morning of Sale, and Catalogues had.

Wednesday Next.—(Sale No. 7659.)

ODONTOGLOSSUM MULUS IN FLOWER. MR. J. C. STEVENS will include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, on WEDNESDAY NEXT, April 11, a strong plant in flower of a fine variety of the rare ODONTOGLOSSUM MULUS.

On view morning of Sale, and Catalogues had.

Wednesday Next.—(Sale No. 7659.)

ERIDES HOULETTIANUM. DENDROBIUM BRYMERIANUM, fine specimens. 2500 DENDROBIUMS, in variety. VANDA DENISONIANA.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT, April 11, at half-past 12 o'clock precisely, by order of Messrs. High Low & Co., a very large quantity of imported ORCHIDS, in the finest possible condition, comprising Erides Houlettianum, Angulosa Clowesi, Cymbidium eburnum; 60 fine strong Dendrobium Brymerianum, some of the bulbs 2 feet in length, and one mass with 120 bulbs; 109 D. crassinode, 150 D. Cambaligatum, 200 D. cretaceum, 1000 D. Bensoniae, 450 D. Devonianum, 400 D. Falconeri, 600 D. Wardianum, lowii, alba, chry-otes, D. Farnieri; D. Freemani, D. Parishii, D. primulinum; Odontoglossum Pescatorei, in especially selected specimens; P-lione humilis, P. maculata, P. Wallchiana, Saccolabium, Vanda Amesiana, p-ndusomat, and other choice ORCHIDS.

On view morning of Sale, and Catalogues had.

Wednesday Next.—(Sale No. 7658.)

500 first-class Standard and Dwarf ROSES to name from well-known English growers, Hardy Ornamental SHRUBS and CONIFERS, FRUIT TREES of all sorts, TUBEROUS BEGONIAS from Ghent, a fine Collection of CALECTHONS, PICOTEES, PINCS, HOLYHOCKS, ASTERS, and other BORDER PLANTS, in Camps of SPIREEA PALMATA, LILIUMS, GLADIOLI, &c.

MR. J. C. STEVENS will SELL the above by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY NEXT April 11, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 7660.)

VALUABLE IMPORTED ORCHIDS. CATLEYA AUREA. SKINNERI variety. LÆLIA ACUMINATA MAXIMA. ONCIDIUM UNDUULATUM.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 12, at half past 12 o'clock precisely, by order of Mr. F. Sander, a splendid importation, just arrived, of the handsome and brilliant-flowered CATLEYA AUREA, in grand condition, well furnished with green foliage and sound, unbroken eyes; also a very fine-looking CATLEYA from a new district, probably a variety of C. Skinneri; a fine importation of the very scarce and beautiful LÆLIA ACUMINATA MAXIMA—the flowers of this Orchid are very large, and of the lip rich-colored; fine pieces of the rare ONCIDIUM UNDUULATUM, breaking freely, together with quantities of Burmese Dendrobis, Oncidium cucullatum, Odontoglossum Pescatorei, Ada aurantica, Lælia autumnalis, L. alba, P-umbina candida, Arundina bambusaefolia, Vanda teres, Odontoglossum grande, Brassavola glauca, and many other ORCHIDS.

On view morning of Sale, and Catalogues had.

Thursday Next.—(Sale No. 7960.)

10,000 grand Bulbs of LILIUM AURATUM, received from Japan, in the finest possible condition.

MR. J. C. STEVENS will include the above in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY NEXT, April 12.

On view morning of Sale, and Catalogues had.

Collection of Established Orchids.

MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on WEDNESDAY, April 18, at half-past 12 o'clock precisely, the COLLECTION of ORCHIDS formed by A. G. Wallis, Esq., of Thornlea, Balham. Amongst other fine things will be found Cologyne Messingiana, C. cicutata Lemouliana, Oncidium Marshallianum, grand var., Angraecum sequepieda, Aeris crassifolium, and the usual varieties of Odontoglossums, Dendrobis, Oncidiums, Cattleyas, Vandas, &c.

On view morning of Sale, and Catalogues had.

A New Species of Lady's Slipper from New Guinea. CYPRIPIEDUM ROTHSCCHILDIANUM. Now in flower at the St. Albans Orchid Establishment, and pronounced by those who have seen it, one of the very finest Cypripeds ever introduced.

MR. J. C. STEVENS has been instructed by Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 20, the entire stock of CYPRIPIEDUM ROTHSCCHILDIANUM.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26.

At 38, King Street, Covent Garden, W.C. Specially rare and fine ONCIDIUM ONCIDIUM BIFOLIUM MAJUS. Only one this so beautiful Oncidium has been imported, and the locality in its native country was lost for many years. We have succeeded in rediscovering this fine Orchid, and MR. J. C. STEVENS will SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, by direction of Mr. F. Sander, a specially grand importation, in unusually fine order, of ONCIDIUM BIFOLIUM MAJUS. This handsome Orchid has often been eulogised by the press, and is all to whom it is known. It is, however, so rare, that only one or two old collections of Orchids contain it. The flowers are very elegant, and produced on drooping spikes, large, and sepals and petals are chocolate, marked with yellow, and lip deep golden yellow. It is a plant of most easy culture, and it gives us special pleasure to be enabled to offer such a fine and so rare an Orchid.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26,

At 38, King Street, Covent Garden, W.C. DENDROBIUM NOBILE, Sander's variety. This is undoubtedly one of the very finest Dendrobiums in existence, and a close rival to Dendrobium noble nobilis, which it much resembles. It is as large and finer in form, and has a far finer and larger black centre. See drawing of this wonderful Dendrob.

MR. J. C. STEVENS has received instructions from Mr. F. Sander to include in his SALE by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, the entire stock (excepting bulbs kept for propagating) of DENDROBIUM NOBILE, Sander's variety. For beauty and grandeur there are few Orchids in existence to rival this Dendrob.

On view morning of Sale, and Catalogues had.

Sale Thursday, April 26.

At 38, King Street, Covent Garden, W.C. Very rare and fine ONCIDIUM.—ONCIDIUM SPLENDIDUM. MR. J. C. STEVENS has received instructions from Mr. F. Sander to SELL by AUCTION, at his Great Rooms, 38, King Street, Covent Garden, W.C., on THURSDAY, April 26, a splendid importation of ONCIDIUM SPLENDIDUM. For many years past we have tried to discover the habitat of this most important Oncidium, and have now succeeded. The flowers are 4 inches long, similar to Oncidium tigrinum, but more lovely. For full description see Catalogue, which may be had in due time of the Auctioneers.

The Valuable Collection of Orchids formed by the late John Day, Esq., of Tottenham.

MR. J. C. STEVENS begs to announce that he has been favoured with instructions from the Executors of the late John Day, Esq., to SELL by AUCTION, without the least reserve, at his Great Rooms, 38, King Street, Covent Garden, W.C., his entire Collection of ORCHIDS, consisting of the choicest species and varieties, and including many plants of exceptional interest. Amongst other varieties will be found a grand collection of the rarest and choicest CYPRIPEDES, in the finest health.

The First Portion of this Collection will be SOLD on WEDNESDAY and THURSDAY, May 9 and 10. N.B.—For fuller particulars, see Gardeners' Chronicle, March 21.

Tuesday Next.

CARNATIONS and PICOTEEES, a first-class collection of the best varieties; 500 Standard and Dwarf ROSES, selected FRUIT TREE, HARDY CONIFERS, RHODOENDRONS, HERBACEOUS PLANTS, CLIMBERS, and GREENHOUSE PLANTS.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at the City Auction Rooms, 38 and 39, Gracechurch Street, E.C., on TUESDAY NEXT, April 10, at half-past 12 o'clock precisely.

On view morning of Sale. Catalogues had at the Rooms, and of the Auctioneers, 67 and 68, Cheapside, E.C.

Tuesday Next.—Without Reserve.

1000 ODONTOGLOSSUM VEXILLARIUM. MESSRS. PROTHEROE and MORRIS are instructed by Mr. F. Sander to include the above in their SALE of ORCHIDS on TUESDAY NEXT, April 10. This importation is from an entirely new district, and the darkest and largest flowered varieties ever seen will be found among them. The plants are in splendid order with sound healthy bulbs and foliage, and we are certain that never before have such fine varieties been offered for Sale.

On view morning of Sale, and Catalogues had.

Tuesday Next.

The BROOMEFIELD COLLECTION of ORCHIDS. IMPORTANT UNRESERVED SALE of the First Portion of the celebrated COLLECTION of ESTABLISHED ORCHIDS, by order of Robert Warner, Esq., who is giving up their cultivation in consequence of long-continued ill-health.

2000 ODONTOGLOSSUM ALEXANDRE, not a single plant having yet flowered in this country. MESSRS. PROTHEROE and MORRIS are favoured with instructions from R. Warner, Esq., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY NEXT, April 10, at half-past 12 o'clock precisely, the First Portion of his well-known COLLECTION of ESTABLISHED ORCHIDS, consisting of about 2000 Odontoglossum Alexandræ, entirely unflowered plants. The whole of the plants were collected by Mr. Carder specially for Mr. Warner, and amongst those which have flowered from the same importation numerous well-known varieties have bloomed. The plants have from four to ten bulbs each, and the whole will be sold absolutely without reserve.

On view morning of Sale, and Catalogues had.

Wednesday Next.

10,000 LILIUM AURATUM, splendid Bulbs, from Japan. MESSRS. PROTHEROE and MORRIS will include the above in their SALE by AUCTION on WEDNESDAY NEXT, April 11.

On view morning of Sale, and Catalogues had.

Wednesday Next.

NURSERY STOCK. STOVE and GREENHOUSE PLANTS from Sample. IMPORTANT to GENTLEMEN, NURSERYMEN, FLORISTS, and OTHERS.

MESSRS. PROTHEROE and MORRIS will SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY NEXT, April 11, at half-past 12 o'clock precisely, the following quantities of NURSERY STOCK, STOVE and GREENHOUSE PLANTS, from Sample:—

Table with 2 columns: Plant names and quantities. 2000 Dwarf Roses, 500 Aucuba japonica, 3000 Green Box, 300 English Yews, Limes, Poplars, Standard Trees, 1000 Privet, 1000 Perennials, 1000 Double White Primulas, 1000 Ptychosperma Alexandræ, 500 Areca Intescens, 500 Kentia Belmoreana, 1000 Rhododendrons, 1000 Choice Chrysanthemums, 500 Tea Roses in pots, 500 Carnations and Picotees, 1000 Ferns, in variety, 400 Seaforthia elegans in pots, 1000 Cocos Weddelliana in 60 pots, &c.

Samples will be on view morning of Sale. Catalogues on application to the Auctioneers, 67 and 68, Cheapside, E.C.

Wednesday and Saturday Next.

LILIUM AURATUM from Japan, a choice assortment of English-grown LILIES, including most of the best varieties in cultivation; GLADIOLI, GREENHOUSE PLANTS, in variety; Standard and Dwarf ROSES, HERBACEOUS PLANTS, &c.

MESSRS. PROTHEROE and MORRIS will SELL the above by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on WEDNESDAY and SATURDAY NEXT, April 11 and 14, at half-past 12 o'clock precisely.

On view morning of Sale, and Catalogues had.

Friday Next.

CATLEYA SANDERIANA. 500 CATLEYA MESSLIERI. ODONTOGLOSSUM LUTEOPURPUREUM SCEPTRUM. ODONTOGLOSSUM ALEXANDRE.

MESSRS. PROTHEROE and MORRIS are instructed by Mr. F. Sander, to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, April 13, at half-past 12 o'clock precisely, a large importation, just arrived in splendid order, of grand CATLEYA SANDERIANA, with large, broad, distinct-looking leaves, and stout spikes, embracing many compact and fine-looking pieces. Also a quantity of CATLEYA MOSSIE, with fine foliage and numerous unbroken eyes. Splendid pieces, in excellent order, of the beautiful and rare ODONTOGLOSSUM LUTEOPURPUREUM SCEPTRUM, with fine distinct-looking bulbs; CYPRIPIEDUM SCHLIMII, fine lot; ODONTOGLOSSUM CORONARIUM, EPIDENDRUM, NEMORALE, CATLEYA LAWRENCEANA, ODONTOGLOSSUM TRICHOPIANS, CYMBIDIUM LOWII, together with a very fine importation of ODONTOGLOSSUM ALEXANDRÆ, collected in the best locality, whence have come the finest varieties in collections, and many other choice ORCHIDS.

On view morning of Sale, and Catalogues had.

Preliminary Notice.—Without Reserve.

The whole of the well-known collection of Specimen Exhibition STOVE and GREENHOUSE PLANTS, PALMS, &c., which have taken so many Prizes at the leading Metropolitan and Provincial Shows, by order of Messrs. T. Jackson & Sons, who have given up exhibiting.

MESSRS. PROTHEROE and MORRIS are instructed to SELL the above valuable COLLECTION of PLANTS, by AUCTION, on the Premises, The Nurseries, Kingston-on-Thames, on THURSDAY, April 26.

Fuller particulars will appear in future Advertisements.

Friday, April 27.—Established Orchids.

A portion of the well-known collection of ESTABLISHED ORCHIDS, by order of C. Dorman, Esq., of The Firs, Laurie Park, Sydenham, who is making alterations to his Greenhouses, necessitating the disposal of some of the Plants.

MESSRS. PROTHEROE and MORRIS are favoured with instructions from C. Dorman, Esq., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY, April 27, at half-past 12 o'clock precisely, a portion of his well-known collection of ESTABLISHED ORCHIDS, amongst which will be found the following valuable plants:—

Table with 2 columns: Plant names and quantities. Lælia purpurata, magnificent plant, 142 bulbs, 22 leading growths, 12 sheaths; Cattleya exoniensis, good plant; Roticekiaa superba, true; Wagneria; Lælia cuspatha; Cymbidium pendulum atropurpureum, very fine plant (rare); Cymbidium Parishii, good plant; Vanda Sanderiana, splendid plant, good variety, 4 leads; Cypripedium insigne Wallacei; Dendrobium Lecchianum; Dendrobium mobile Cooksoni.

On view morning of Sale, and Catalogues had.

The Brentham Park Collection of Orchids.

Highly important unreserved sale of the first portion of this celebrated collection of ESTABLISHED ORCHIDS, by order of Robert Smith, Esq., who is giving up their cultivation.

MESSRS. PROTHEROE and MORRIS are favoured with instructions from R. Smith, Esq., to SELL by AUCTION, at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on TUESDAY and WEDNESDAY, May 1 and 2, at half-past 12 o'clock precisely, without Reserve, the first portion of this well-known collection of ESTABLISHED ORCHIDS, amongst which will be found the following and other rare species:—

Table with 2 columns: Plant names and quantities. Cattleya Bluntii, exoniensis superba, Skianeri alba, labiata (autumn flowering var.), Lycaste Skinneri alba, Lælia anceps Sanderrana, Oncidium ornithorycium album, Odontoglossum Jenningianum parvatum, Cologyne Massangeana.

No Plants will be sold privately prior to the Sale.

On view morning of Sale. Catalogues of the Auctioneers, 67 and 68, Cheapside, London, E.C.

Orchids in Flower.—Tuesday, April 24.
MESSRS. PROTHEROE AND MORRIS desire to announce that their NEXT SPECIAL SALE OF ORCHIDS IN FLOWER will take place as above, for which they will be glad to receive Notice of Entries as soon as possible.

ORCHIDS.

THE
LIVERPOOL HORTICULTURAL COMPANY
(JOHN COWAN), Limited

are pleased to announce the arrival of another grand lot of

MEXICAN ORCHIDS,

in the best possible condition, including
MANY MAGNIFICENT MASSES

LÆLIA ANCEPS, WHITE,

the same as their last fine importation. The bulbs resemble those of **L. anceps Schroderiana.** The dried flowers sent with the plants are very large and four and five are produced on each spike. The plants appear to have been very floriferous. The importation also includes a grand lot of

LÆLIA ANCEPS MORADA,

from the same district as the Company's previous importations of this fine variety. Many other grand varieties are included in this large and fine importation.

The Company have also just received the largest and finest importation of

EAST INDIAN ORCHIDS

which they have ever had. Many of them have been collected in a part of Upper Burma never before reached.
 This grand importation includes a fine lot of

DENDROBIUM BRYMERIANUM

with bulbs upwards of 2 feet long.
 Immense masses of

DENDROBIUM WARDIANUM LOWII,
DENDROBIUM THYRSIFLORUM,
DENDROBIUM DALHOUSIEANUM,
DENDROBIUM DEVONIANUM,
DENDROBIUM BENSONLE MAJUS,
DENDROBIUM ALBO SANGUINEUM,
DENDROBIUM CRASSINODE BARBERIANUM
DENDROBIUM JAMESIANUM,
 and many other Dendrobies. Also

CÆLOGYNE BARBATA,
CYMBIDIUM LOWIANUM,
CYPRIPEDIUM BOXALLI,
CYPRIPEDIUM VILLOSUM,
TRICHOSMA SUAVIS,
 and many other fine species.

The special feature of this importation is the size and quality of the plants.

The Company will also shortly receive a large and fine importation of

CATTELEYA MENDELII

collected by an experienced man, sent out specially to secure fine specimens and varieties of this GRAND CATTELEYA.

Many other fine importations will shortly follow.

As the Company receive Orchids in such large quantities, they are able to offer them at very reasonable rates.

Full particulars will be sent, post free, to all who favour the Company with their Names and Addresses.

THE VINEYARD & NURSERIES
GARSTON, near LIVERPOOL.

CHARLES SHARPE & CO.
 "Standard" Selected Home-grown
MANGEL AND TURNIP SEEDS,
 Raised upon their Seed Farms at Heckington and Hale, in the County of Lincoln.
 REG. TRADE-MARK.

 Special offer to the Trade on application.
SLEAFORD.

ORCHIDS.

An Immense Stock of recently imported plants compels a sale of the established plants to make room. These have not yet flowered, but are all flowering plants, and must be sold at a great sacrifice. Very valuable varieties are certainly to be obtained and great bargains. See public Journals for high prices recently obtained. The Special Offer affords a paying investment to anyone with glass at command, which should not be overlooked; such plants may never again be offered to the public and the trade.

Lilium auratum.—Eighth arrival of 10,000 Bulbs, the best that money can buy anywhere, 4s., 8s., and 10s. per dozen. Specially imported Non Plus Ultra bulbs, 2s. 6d. each; very liberal allowance to the Trade.

Lilium album Krætzeri.—The most lovely white Lily grown; throws seven to ten flowers, which sell in market at 2s. per dozen; beautiful and rare, 1s. each, 10s. per dozen.

Lilium speciosum rubrum cruentum.—The dark form of this lovely Lily, most exquisitely marked, 1s. each, 10s. per dozen.

Lilium auratum, platyphyllum, rubro-vittatum, crimson, striped with gold; **virginale,** pure white, and spotted, with gold band. All these lovely new and distinct forms of auratum, suitable for show purposes, very fine bulbs, 5s. each.

Lilium Harrisii, 10s. per dozen; and all other Lilies equally cheap. Banksian Silver Medal awarded August, 1887.

Japanese Novelties—80 varieties Iris, Tree Peonies, Maples, Camellias, Azaleas. Please apply for special offer to

GARLIES MITCHELL, Nurseryman, Stranraer.

A Good Potato, of Sterling Worth.

MAIN CROP KIDNEY,
W. W. JOHNSON AND SON,
First-class Certificate awarded by the Committee of the Royal Horticultural Society, September 21, 1887.

It was tested by cooking, and described by the Committee as a "White Kidney, with clean, rough skin, white flesh, a good cropper."

This Potato is pronounced by competent judges as likely to become one of the best Main Crop Potatoes of the future. It has entirely resisted disease; tubers have a handsome appearance, with very shallow eyes; are white, mealy, and of the finest flavour when cooked. In excellent condition for the table from the time of taking up until late in the spring.

Price per peck of 14 lb., 5s.; per bushel, 18s.

Wholesale of Messrs. HURST AND SON, 152, Rouds-ditch, London, E.; and from W. W. JOHNSON AND SON, Seed Potato Growers and Seed Merchants, Boston, Lincolnshire.

80,000 CLEMATIS, in Pots, of all the finest Double and Single Varieties (some of the flowers of which become 10 inches across, and are of every shade, from pure white to the darkest purple), for climbing and bedding, from 12s. to 21s. per dozen, strong plants; extra strong plants, reported into 4-inch pots, 2s. 6d. each. Descriptive LIST on application.—RICHARD SMITH AND CO., Nurserymen and Seed Merchants, Worcester.

To the Trade

HARTLAND'S IRISH-GROWN DAFFODILS.

"The perfumed amber cup which, when March comes, gems the dry woods and windy wolds, and speaks the resurrection."

TRUE to the poetic idea of an ITALIAN CLIMATE.
In Ireland, at Temple Hill, Cork, thousands are now "tossing their heads in sprightly dance." The following to bloom in March:—

50,000 PRINCEPS	30,000 VARIFORMIS
30,000 NOBILIS	10,000 CORBULARIA CITRINUS
20,000 ARD-RIGH	10,000 PALLIDUS PRECOX
8,000 MOSCHATUS	100,000 TELAMONIUS PLENUS
8,000 CAPAX	10,000 PSEUDO-SCOTICUS.

A semicircular Border, containing over 5000 Bulbs of the beautiful WHITE DAFFODIL "LEDA," is a sight not to be seen in the United Kingdom. William Bayler Hartland's unique Collection of Rare White Daffodils will all bloom this month.

. Boxes of Cut Specimens, true to name, from 5s., 7s. 6d., to 10s. With each order for a "Box of Blooms" will be presented a copy of his "Little Book" of Daffodils, unique as a work of art, and faithfully illustrated by Gertrude Hartland, the Book by itself being 1s. 6d. each copy.

SUTTON'S SEEDS
GENUINE ONLY FROM
SUTTON & SONS, READING.

DANIELS' ROYAL NORFOLK RUSSET.

SYN.—"The Village Blacksmith."

THE most REMARKABLE POTATO ever raised. The tubers are of medium size, and roughly netted; eyes, few and shallow; flesh, white; fine grained; boils like a ball of flour, and of the finest flavour. It is a great disease resister, and is pre-eminently adapted to moist soils and districts. We have grown it six or seven seasons, and have never known one diseased.

Price, 3s. 6d., 14 lb.; 12s. 6d., 56 lb.; 21s. per cwt. Orders for 1 cwt. and upwards carriage paid.

UNSOLICITED TESTIMONIALS.

IRELAND.—J. JONES, Esq., M.D., Ardee, September 5. —"In 1885 I had from you 1 lb. of Royal Norfolk Russet. I planted the produce in 1886, and again this season. On the 3rd inst. I dug from two stalks forty-one tubers about 14 lb. Such as were cooked were excellent, white, floury, and of good flavour.

ENGLAND.—From Mr. T. R. Baily, Barrington, Cambs. —"Your Royal Norfolk Russet greatly exceeded my expectations, turning out remarkably well."

SOUTH AFRICA.—From Mrs. Francis, Pietermaritzburg. —"The Potatoes gained first prize as a collection. The Royal Norfolk Russet first as a round variety."

A CHANGE OF SEED ALWAYS PAYS.

STRAWBERRIES FOR FORCING.—Apply for LOVEL'S SELECT LIST OF STRAWBERRY RUNNERS for 1888, with Prices; or send 3d. for Sample of Plants and Pamphlet. Runners ready in July. Great demand. Book early.—W. LOVEL AND SON, Strawberry Growers, Driffield.

CARNATIONS AND PICOTEEES.
(PLANT AT ONCE.)

I have pleasure in drawing the attention of the Trade and Retail Buyers to my very extensive stock of Carnations and Picotees, which is probably the largest collection in the Trade. The plants this season are strong and healthy, and intending buyers would do well to procure and plant at once, that they may get well established before the warm weather comes.

The Collection consists of the following sections:—
SHOW VARIETIES.
A very complete collection, including all the finest of the Florists' sorts, especially those which are of good constitution.
BORDER VARIETIES (to name).
These have for many years been a great speciality with me. An enormous quantity of them are sold annually. They are all good free vigorous sorts, and such as produce plenty of flower, and are, in consequence, specially suited for the Trade who want quantities of Carnations for cutting.
SELFS AND CLOVES.
A very fine collection, including many varieties of recent introduction. These are specially adapted for border planting; they are mostly all good free flowering, distinct, and bright-coloured sorts. Many of them are strongly Clove-scented.
YELLOW GROUNDS.
A unique collection, which has been materially extended during the last two seasons, and there are now included amongst them many sorts which are as free, both in growth and flower, as the Border varieties, or the SELFS and CLOVES, and are, in consequence, well fitted for outdoor planting, and charmingly suited for the purpose of supplying cut flowers.
CATALOGUES, with full descriptions and prices of the varieties which constitute the various collections, may be had, gratuitously and post-free, upon application to

THOMAS S. WARE,
HALE FARM NURSERIES,
TOTTENHAM, LONDON.

S. SHEPPERSON,
 FLORIST and SEEDSMAN,
 PROSPECT HOUSE, BELPER,
 DERBYSHIRE,

Begs to inform the readers of this Paper that he is prepared to execute orders for the following plants, all of which are of the very finest possible strains that money can buy. They have all been grown on the Derbyshire Hills, and are therefore very hardy, and warranted to succeed and bloom well. All carriage free for cash with order.

DESCRIPTIVE LIST of Florist Flowers,
 4d. stamps, or free to customers.

PANSIES.—A great specialty Five Silver Cups and other Prizes awarded during 1887, probably the best collection in England; the cream only of the most noted raisers, the latest new sorts, and the winners at all the great shows. Good plants, correctly named. Show or Fancy twelve for 3s., twenty-five for 5s. 6d., Carriage free for Postal Order.

FANCY PANSIES.—Un-named, six for 1s., twelve for 1s. 6d., twenty-five for 2s. 6d., Postal Order. All different and first-class sorts, free.

CHRYSANTHEMUMS.—Great special culture, the best and most distinct varieties only, of large-flowered, incurved, reflexed, early and late bloomers, pom-poms, Japanese, &c., including many grand new varieties by the best English, Continental, and American raisers. Twelve distinct varieties, named, well rooted plants, for 2s.; twenty-four for 3s. 6d., free.

GRAND NEW CHRYSANTHEMUMS.—The cream only of the new varieties of 1886 and 1887. Six for 2s., twelve for 3s. 6d., named distinct varieties.

HOLLYHOCKS (Double).—Chaters' very finest and most select strain. Twelve varieties for 2s. 6d., six for 1s. 6d.; six extra strong for 2s., Postal Order, free.

CANTERBURY BELLS.—Grand new colours and new forms, double and single Telescope, Candelabrum, and other varieties. Twelve good plants, to bloom well, for 1s.; twelve extra strong for 1s. 6d., Postal Order, free.

PURE SNOW-WHITE AURICULA.—One of the most beautiful hardy spring flowering plants in cultivation. Two for 1s., free.

AURICULAS.—A really grand strain of this deliciously scented old-fashioned favourite flower, including Turner's Alpines, Dean's new lace variety, Dewberry's Giant, and other really fine sorts. Good plants, that will bloom well this spring, three for 1s., six for 1s. 6d., twelve for 3s., all free.

POLYANTHUS.—Finest strain grown, fine large trusses and blooms, and splendid colours. Cannot be surpassed. Twelve for 1s., twenty-six for 2s., 100 for 7s., free. All good blooming plants.

POLYANTHUS and PRIMROSE.—Jack-in-the-Green, Hose-in-hose, and other rare and curious forms unnamed. Six distinct sorts for 1s. 6d., twelve for 2s. 6d., free.

THE NEW DOUBLE SCARLET GEUM.—Quite hardy. Free bloomer. Grand for cutting or decoration. Twelve for 1s., twenty-five for 2s., Postal Order, free.

CARNATIONS, PICOTEES, and CLOVES.—Strong plants, from finest how flowers only, including many new sorts. Will give a mass of bloom. Twelve beautiful varieties for 2s. 6d., six for 1s. 6d., free.

SCABIOSA (Double).—A really fine hardy plant for garden decoration or cut flowers. Many fine colours. 1s. per dozen, free.

PRIMULA CASHMIRIANA.—Splendid hardy mauve-coloured spring flowering plant. Three for 1s., free.

COLLECTION of twelve HARDY BORDER PLANTS, distinct and useful for decoration and cutting purposes, for 2s., free.

WALLFLOWERS.—Double German, Crawford Beauty, Ware's dark red, and Kershaw's bright red. 1s. per dozen, free.

FOYGLOVES.—Gloxinia-flowered, Deac's grand new large spotted varieties, very fine, twelve for 1s. 6d., six for 1s., free.

ALSO the FOLLOWING FREE-BLOOMING HARDY PLANTS: should be in every garden; all at 1s. per dozen, free:—Pure white Thrift, fine edging and spring flower; Malva moschata alba and rosea, beautiful pure white and rose bloom all summer; Sweet Williams, the finest dark and giant Auricula-eyed; Arabis albidia, white spring-flowering plant, beautiful variegated foliage.

STRAWBERRY PLANTS.—Selected crowns, transplanted, Black Prince Improved, British Queen, Alpha, Pauline, Sabreur, Viscontesse H. de Thury, Duke of Edinburgh, King of the Earlies, and other extra sorts. 3s. per 100, free. Also the Captain (Laxton's), twenty for 1s., free.

SATURDAY, APRIL 7, 1888.

ROSE-PRUNING.

ALTHOUGH there are general principles and rules by which the pruning of Roses is regulated, yet there can be no doubt that "circumstances alter cases," and that, consequently, as there are differences in the seasons, so pruning does not always take place at the same time, or in the same manner. We are only just emerging from winter; and, as far as the south-eastern part of Kent is concerned, we have experienced a season such as not even the memory of the oldest inhabitant can recall. I was talking the other day with an old parishioner of eighty-four, and he could not recollect such a one, but he "had heard his father tell" of one he recollected, when heavy snow blocked up all the roads on March 19. This probably is the one to which the poet Cowper alludes in 1788. This is what we can "tell on" now. Snow to the depth of a foot fell on Sunday and Monday, April 1, 2, with a fierce gale from the north-east, driving it before it, so that all our roads were blocked up, in some cases to the depth of 7 or 8 feet; and, in fact, the whole month of March, with the exception of a day or two, has been as bad as could be well looked for—an apt illustration of "the chaotic weather which we call the climate of England." Under these circumstances pruning has been quite out of the question, and in the last week in March mine at any rate are untouched—a fact at which I rejoice.

I looked over some of my bushes yesterday, and was surprised to find that the wood, both of hybrids and Teas, was uninjured. I cut some pieces from the long shoots which will have to be cut away, and which were of necessity more exposed to the influence of the frost, and the pith was in no way discoloured; and, therefore, I conclude, that when the snow does go away and spring commences, I shall find the wood generally has escaped frost. I cannot of course say how it may be in other places, nor do I think, if they have not been hit hard, that one can deduce

much from it, except it may be this—that owing to the bright dry summer of last year the wood was not so sappy, and was thoroughly ripened; for I think we have all experienced that either in situations exposed to damp, or after wet seasons, plants of all kinds are much more susceptible to frost than where the situation and climate are alike dry.

There are two questions, (the two questions, in fact, in relation to pruning), concerning which this season has pronounced very decidedly—late pruning and hard pruning. There can be no question that during the last few years a great change has taken place with regard to the occurrence of late frosts in April and May. Whether the long season of cold weather with snow and frost which we have experienced up to the end of March will save us from those in May, time alone can tell. The consequence of these frosts has been that where the orthodox rule of pruning in the beginning or middle of March has been adhered to, the young shoots (probably 4 or 5 inches in length) have been in many places cut off, and, indeed, a second pruning has become necessary in some cases, while in all, injury to the young shoots has been done. I think Rose growers are unnecessarily anxious about the young spring growth in the unpruned bushes, which they think, if not cut off, must materially weaken the plant. I do not think that it is so, and that in mild weather, when the bushes are perfectly green with the young shoots, they do in any way exhaust themselves. In some early districts, such as Reigate, pruning often takes place in February, and in some seasons the young shoots may be sufficiently matured to meet the spring frost with impunity, while if they have been so pruned this year, I should imagine, if the weather has been at all like what we have experienced, they must have suffered considerably. Pruning may, taking all things into consideration, be deferred to the beginning of April, and, indeed, in this season has hardly in our locality begun before that; the snow is not yet gone, and it will be some days before we can get on the beds. It is very probable that after a prolonged cold time, such as we have experienced, a forcing time may supervene and things will come on rapidly.

The other point of importance connected with pruning is as to whether it should be what is called hard pruning or not. I remember the time when it used to be considered that strong shoots which come up from the base of the dwarf Roses, whether on Manetti or seedling Brier, were "robbers" and had to be treated as such, cut away root and branch, but it was manifest that this was wrong, and now these strong shoots are looked upon as the mainstay of the plant for the next season, and instead of cutting them away, to cut away all the old and weakly ones and rely on these shoots for the year's blooming. These weakly shoots will not produce good flowers, and even although a grower may never intend to exhibit he may as well have the best blooms he can get. In pruning, then, the first thing will be to cut away all these, and also to clear away the centre of the bush, provided that there are sufficient shoots left to make a shapely bush; this being done, the other shoots have to be shortened, and it may be taken as an axiom on this point, that the stronger the grower the less severe may be the pruning—in fact, pruning hard such strong growers as Etienne Levet, Edouard Morren, Paul Néron, and others of a similar character, would have the effect of inducing a maximum amount of growth with a minimum of bloom; on the other hand, delicate growers, of which there ought to be fewer every year in the Rose garden, require very hard pruning; they cannot support a large number of shoots, and hence it is best to cut them to two or three eyes. After such a season as we have just experienced there will be in many places a necessity for hard pruning, owing to the frost, and therefore, wherever the pith is discoloured the plant must be cut back beyond it, whether the plant be a strong or weak grower. Sometimes, too,

even where the pith has escaped, there will sometimes be seen a discoloration of the bark; this indicates that it has suffered there, and all such should be cut away.

It will, perhaps, be found necessary to supply some vacancies in the beds; I have myself a few plants "heeled in" which are to perform this duty, and as after the quantity of snow which we have had the ground is too saturated with moisture for planting, I shall either defer this for a little or else dig out the hole where they are to be planted, and fill it in with dry loam which has been under cover for some time. These plants will be pruned quite hard before they are planted, and the same thing, I think, should be done with all those planted last autumn. They are required to make both roots and wood-growth, and it is far more important that they should have plenty of scope for the former operation, and thus have less to do above ground. A certain amount of root-action goes on during the winter, but it is when spring comes that the effort is made, and should be helped by all the means in our power.

The remarks which I have made as to pruning refer to the hybrid perpetuals. Teas are always pruned later, but I imagine that this year there will be but a small gap between the pruning of the H.P.'s and the Teas. Opinions have differed and will differ as to the best method of pruning them. Some eminent growers, as Mr. Prince, say that they do not require much pruning; others say prune hard, and I have seen them prosper under both plans. I sometimes alternate the process in some of my beds, pruning hard one year and slightly the next. Noisettes are best left alone, or, if touched, thinned out and the tips of the branches slightly shortened.

One cannot forecast, but much seems to be in favour of a good Rose year; the thoroughly ripened wood of last autumn has stood the winter well, and the length of the cold weather makes me hopeful that we may escape May frost. A drought is threatened: let us hope that it may not come, so that we may reasonably look forward to what we have not had for some years—a thoroughly good Rose season. *Wild Rose.*

INDIAN "CONSERVATORIES."

THE engraving fig. 60, represents a conservatory of a makeshift class which is becoming very common in India. This was originally a Badminton court, with a thatched roof, that a change of fashion had left tenantless and ugly. The thatch was removed and its place occupied by cocoa-nut fibre matting of thin texture. Banks of rich soil were raised and planted with Begonias, Gesnera zebrina, Ferns, and other shade-loving plants. When the photograph was taken the conservatory was richly coloured with numerous flowers of Begonia hydrocotylifolia.

The covering admits abundant light and prevents the rapid changes of temperature induced by radiation to a clear sky at night which is one of the most striking phenomena of the dry climate of India that is, by far the greater part. In Italy a somewhat similar arrangement is made for the shelter during the summer of plants taken from the houses, while in this country a structure of the kind covered with tiffany is very serviceable for the growth of Camellias, Indian Azaleas, Sikkim Rhododendrons and hosts of other plants which require no protection beyond that so afforded. For our illustration we are indebted to Mr. Woodrow of Ghunesh Kind.

NEW OR NOTEWORTHY PLANTS.

ASPASIA PRINCIPISSA, *Rehb. f.*

THE species of *Aspasia* are not particularly common in gardens, though three of them have come into my hands during the past few months. The latest one, which was forwarded by the Messrs. Veitch, of Chelsea, I was particularly pleased to meet with, as it proved on examination to be the above-named very rare plant. It was discovered long ago by Warszewicz, and a coloured sketch of a single flower, made by that gentleman, is preserved in Dr. Lindley's Herbarium, now at Kew. And now comes

a flower from which that sketch might have been prepared, so close is the resemblance. It is to my mind an exceedingly interesting plant, though not exactly a beauty. The flowers are over 2 inches across, the shape being almost that of *Odontoglossum*, to which genus, indeed, it has been referred. The segments are lanceolate-linear, light green, each with about seven longitudinal narrow brown lines; and the lip, which is nearly 1 inch long, is broadly pandurate in shape, and light buff in colour, while near the base are a pair of prominent calli lying parallel with each other. *R. A. Rolfe.*

CYNOSORCHIS ELEGANS, *n. sp.**

It is a very exceptional thing to see specimens of this interesting genus, the specimens of which are mainly confined to Madagascar, alive in Europe. Messrs. H. Low & Co., however, have succeeded in flowering two species, both undescribed. This one is an exceedingly elegant gem. It has light green cuneate, oblong-lanceolate acute leaves, 2 inches in length by half an inch in breadth, with mauve-purple stripes underneath, and numerous transverse mauve-purple, short, seriate bars on the inner side, excepting on the simply green basilar part. In one of the specimens there were two smaller bars above. The slender naked peduncle has a sheath in the centre. The raceme bears three to seven flowers, which do not exceed those of a good *Gymnadenia conopsea*. Bracts triangular acute, from a quarter to three-fifths of the length of the ovaries. The odd sepal is gibbous (!), quite convex, abrupt over the triangular acute apex, shorter than the ligulate acute or blunt acute side sepals. Petals narrower, ligulate acute. Lip with a small angle on each side at the base. Lamina of the lip trifid, transverse, side-laciniae ligulate, blunt, or rather acute, divaricate; central lacinia triangular, sometimes broad, at others very narrow, much shorter. Spur filiform, straight or bent, nearly equal to, or distinctly shorter than the stalked ovary. Rostellum trifid, mid-lacinia triangular. Colour of flowers whitish with a very bright rosy hue. The lamina of the lip has deep rich purple spots or longitudinal lines. Spur at the apex white or green. *H. G. Rehb. f.*

CYNOSORCHIS LOWIANA, *n. sp.†*

This was also kindly sent me by Messrs. H. Low & Co., as well as the *Cynosorchis elegans*. As I believe that the name of this excellent family has never been associated with a plant coming from Madagascar, I now supply the defect with great pleasure.

The tubercles are elongate cylindrical, blunt or acute at the top. I have a single cuneate ligulate acuminate leaf belonging to them, a span long, nearly $\frac{3}{4}$ inch wide. Messrs. Low, however, inform me that there are two-leaved plants. The colour is dark green without any spots. The slender peduncle at hand has four flowers, equalling those of *Cynosorchis fastigiata*. Bracts ligulate aristate, reaching nearly half the length of the stalked ovaries. The odd sepal is convex oblong, blunt acute, shorter than the lateral

* *Cynosorchis elegans*.—Foliis in basi geminis cuneato oblongo lanceolatis acutis inferos violaceo purpureis longitudinaliter striatis, inferos trabeculis brevibus transversis ejusdem coloris, suprapositis (semper?); foliis geminis parvulis; pedunculo spithameo gracili calvo medio univaginato; cracemo trisusque septemfloro; floribus parvulis; bracteis triangularibus; sepalis impari convexo gibbo galeato acuto; sepalis lateralibus ligulatis obtuse-acutis reflexis; tepalibus ligulatis acutis angustioribus; labelli auriculis in basi utriusque angulatis, lamina trifida, lacinia lateralibus divaricatis ligulatis obtusis acutis, lacinia mediana triangula bene minori, calcaris filiforme ovarium non omnino quantae. Flores albi et pallidissime rosei maculis striisque optime purpureis in labello, calcar albus nunc apicem versus viride. Ex Madagascar imp. et benevole misit ex. St. Low. *H. G. Rehb. f.*

† *Cynosorchis Lowiana*, *n. sp.*—Tuberculis cylindricis acutis obtusis; folio cuneato ligulato acuminateo angusto (nunc oliis geminis ex Low); pedunculo apice paucifloro racemoso; bracteis triangularibus setaceis, ovaria pedicellata dimidia non attingentibus; sepalis impari oblongo acuto bene convexo; sepalis lateralibus oblongis obtusis curvis; tepalibus ligulatis acutis, labelli uoque lineari, lamina trifida, lacinia lateralibus, ligulatis divaricatis, lacinia mediana producta bifida, curvibus linearibus retusis, calcaris filiformi apice inflato, ovario pedicellato paulo breviori apice ovarii ac basi calcaris glandipilibus. Ex Madagascar imp. ex. Low. *H. G. Rehb. f.*

oblong blunt sepals. Petals ligulate acute, curved. Lip with a long stalk, trifid, side laciniae linear, extrorse, mid-lacinia deeply bifid, each shank linear, retuse. Spur filiform, clavate at the apex. Sepals and petals whitish-green. Lip fine lilac with an obscure deep purple spot at the base of the mid-lacinia. Anther mauve. Rostellum purple. These are glandular, hairy at the base of the spur and apex of ovary. *H. G. Rehb. f.*

CYPRIPEDIUM DAUTHIERI PETOT × (Br.) ROSSIANUM,
n. var. hybr.

A very unexpected and elegant novelty has appeared with Mr. H. J. Ross, of Castagnolo a Lastra, a Signa, near Florence, and has been kindly

CYPRIPEDIUM HEPLHESTUS ×, *n. hybr.*

This is a waif that has found its way into the rich collection of Mr. R. H. Measures, at The Woodlands, Streatham. Nothing appears to be known of its origin, but it is surmised that it may be a hybrid, artificially raised between *C. barbatum* and *C. Lawrenceanum*, an hypothesis founded on the circumstance that the plant possesses characters that may be seen in both of the supposed parents, those of *C. Lawrenceanum* predominating in the foliage, and those of *C. barbatum* in the flower, whence the presumption is great that this might have been the pollen parent, conformably to the observed influence of the pollen parent in a large number of hybrid

import whatever. [Why, therefore, not have given it an English name? Ed.] Nevertheless, the scientific value of the grand collection of *Cypripeds* at The Woodlands cannot be over-estimated; all procurable forms are here brought together, where they may be studied and compared by the botanist, *A. H. K.*

DOUBLE WHITE CAMPION.

THERE are probably few perennials to equal this in point of beauty, as all who have seen it in perfection will admit. Perfection, however, is rarely attained, and yet it would be difficult to name any plant among summer and autumn flower-

FIG. 60.—CONSERVATORY AT GANESH KIND, INDIA. (SEE P. 424.)

sent by him to me. The odd sepal has purple lines on a white ground. There is no green blotch as there is usually on the superior area, with the outer margins white, as was stated by M. Petot, or at the fine top, as I saw it in 1881, in a specimen kindly given me by M. Massange de Louvrex, of St. Gilles, near Liège. I have now before me a glorious flower of the typical plant, for which I am indebted to our veteran orchidist, Mr. B. S. Williams, of the Victoria and Paradise Nurseries, Holloway. There is no purple between the purple-lilac, which contrasts neatly with the white ground. The odd sepal has broken lines of black-purple spots outside in lieu of green lines. The petals have ochre-brown lines, and the greater part of the lip is ochre-brown, not Indian purple-brown. It is a pretty thing, quite a token of orchidic gratitude for the highly intelligent possessor, *H. G. Rehb. f.*

Orchids whose parentage is known. The leaves are those of *C. Lawrenceanum*, but the tessellation is not perhaps so bright. The flower is as large as that of a good *C. barbatum* with a somewhat broader dorsal sepal; this is white with alternate longer and shorter veins, the central ones green, the three or four marginal ones deep purple; the lower sepal is white, with green veins; the petals are slightly depressed, the basal half brownish-green, with a few blackish warts on the superior margin, the apical half dull purple; the lip is as deeply coloured as is that of the variety of *C. barbatum* called *nigrum*, but not so bright and glossy; the infolded lobes are dull vinous purple, studded with small warts; the staminode is pale green, with deep green reticulations in the centre.

The name suggested by the dusky colours of the lip, is, of course, purely a garden one, and has no scientific

ing perennials which can compare with it in the profusion of its pure white double flowers, which are slightly fragrant when the plants are well established. When liberal treatment is accorded to the plant, its flowers are fully 2 inches across. To secure this result strong one-year-old plants, well established in pots, must be obtained, and these should be planted in deep rich loamy soil at any time during the present month. Should dry weather ensue, water well till the plants are established, and in July or August they will begin to flower, and will continue to do so till cut down by frost. This extended flowering season may be considerably prolonged by potting the plants in October for employment in the conservatory or greenhouse. I adopted this plan with some large two-year-old plants, some years ago, and with excellent results, and the flowers continued to expand in an unheated house till the end of the year, when,

for the safety of the plants themselves, I cut away the flower-stems.

Some years since, in the richly stored garden of the late Rev. H. Harpur-Crewe, I saw a plant bearing hundreds of flowers; true, they were not of the size produced by younger plants, as indeed could hardly be expected, seeing their great profusion. Singularly enough the plant is rarely seen at any of the London exhibitions or meetings of the Royal Horticultural Society—a fact pointing to its relative rarity; and while it is by no means difficult to grow, it is not so readily propagated as the majority of the species. I have never known it to produce seeds, although the type does so abundantly, and by reason of its somewhat woody root-stock, it is not one of the plants easy to increase by division, and the only method of doing so is by cuttings. Root cuttings never make any attempt to grow.

With ordinary cuttings I have been most successful, and from time to time have rooted it in considerable numbers, the system which I have adopted being the following:—In March or April the stock plant is brought into the greenhouse—the earlier the better where large numbers are required—and being in a temperature of 50° the radical growths will soon push forth from the base of the plant. These are the only ones suitable for cuttings. These cuttings are put into sandy soil in the usual way, and covered with bell-glasses. After occupying a shady position on the open stage for a fortnight I plunge them into bottom-heat, when roots are readily emitted, and with few or perhaps no losses. The kinds of cuttings which always fail are those taken from the flower-stem during summer—axillary flower-buds, in fact—which cannot root, much less form a bud at their base. I have known a whole frame to be filled with such abortive cuttings which looked promising enough for a while, but which were exhausted as soon as the flower-bud appeared. Therefore, those who would succeed with one of the best hardy perennials in cultivation must as soon as possible secure cuttings of the right stamp. The popular name of the plant is the double white Campion, and it is synonymous with *L. dioica alba plena* [= *vespertina*?]; but must not be confounded with *L. diurna* or its forms, which are synonymous with *L. sylvestris* [= *Melandryum sylvestre*?] and which increase readily by division. *E. Jenkins, Waterloo Villa, Hampton.*

THE CROSSING OF FERNS.

THE crossing of Ferns, like other new truths, has had to go through all the different stages of ridicule and incredulity until the convictions of a few have at last forced conviction upon the majority, and the fact has received public recognition. I claim for the much despised race of British fernists the credit of having established the truth in this instance.

Until comparatively recent times it was generally accepted that Ferns did not cross; and yet, considering the assistance which, in their endless changes of structure, other forms of life were known to derive from the power inherent in them of crossing naturally, it must at times have seemed strange to the more thoughtful that in a class of plants so remarkable for variation as Ferns that power should be altogether absent.

No doubt the faculty of natural variation (independently of crossing) is great in Ferns, as elsewhere; and no doubt, also, in certain species of Ferns, and of British Ferns especially, this power of natural variation is so conspicuous that the more cautious botanists hesitated for a time—and perhaps for too long a time—to give attention to the conclusions of those who had carefully studied the subject, and thus the acceptance of the truth was retarded. It was not until a foreign Fern or two had done what many British Ferns had long been known to have done, that the serious attention of botanists was drawn to this subject; and I believe I am correct in saying that the first authoritative recognition of the fact was contained in a letter to Mr. E. J. Lowe from Sir Joseph Hooker about the year

1844, in which the latter used these words:—"The hybridisation of Ferns is now an accepted fact." But in the general ignorance formerly prevailing with regard to the reproduction of cryptogamic plants, it seemed altogether preposterous that Ferns could possibly cross. No bee or fly had ever been suspected of visiting a Fern or moss with any such intention or result, and enough was known of the structure of a Fern to preclude the idea of any external agency in fertilisation; enough was known of the history of a Fern from its first leaf until the completion of what appeared to be its final act, viz., the scattering of its spores, to negative the idea that the spore was the result of sexual action; it was known not to be a seed, but beyond that, I believe, nothing was generally known than that by some mysterious transformation, apparently not altogether unlike the threefold changes in the insect life, the Fern produced the spore, the spore developed into the prothallus, and from the prothallus came the Fern.

THE REPRODUCTIVE ORGANS OF FERNS.

It was not until Naegeli, Suminski, Hoffmeister, and other continental botanists, had raised the veil which had so long hung over the secrets of the reproduction of Ferns and other kindred forms, that people were able to recognise that, however different in the process, the principle involved in the reproduction of Ferns was the same as in higher forms of life.* It was they who showed that it was in the prothallus stage that the Fern practically flowered—that on the prothallus were developed the male and female organs (the antheridia and archegonia) corresponding with the stamens and pistils of flowers, and that under certain favourable conjunctions of heat and moisture the antherozoids (corresponding with the pollen of flowers) were detached, and not only so, but were endowed with motion resembling rather the consciousness of animals than the impassiveness of vegetable life, and that this fertilisation was ensured, one archegonium only, I believe, being fertilised in each case, and one Fern only being produced from any prothallus; and as each prothallus contained all that was necessary for the reproduction of the plant, it was not suspected that antherozoids could have power of action beyond the sphere of their own prothallus, and it is sufficiently evident that, unless they had that power, Ferns could not cross.

I have not a word to say against antherozoids generally—they are, I believe as a rule a very steady, stay-at-home race of little zoids; but there are exceptions—occasionally there are some that show a vagrant tendency—hence the results that we have to chronicle.

Concurrently with, but independently of, the researches of Hoffmeister and others—independently also of each other—there were, among the earliest cultivators and students of the varieties of British Ferns, some who were occasionally struck by the appearance of forms bearing a very suspicious resemblance to combinations of other forms, and attention having been arrested, observation became keener; and as in course of time these instances became more numerous, cultivators could not at last resist the evidence of their senses, that, in some way, unknown to them, Ferns crossed, and experiments undertaken with the view of more completely testing the correctness of their impressions placed the matter entirely beyond doubt in the minds of all who had given attention to the subject.

PIONEERS.

When independent conclusions have been formed, nearly about the same time, by several, it would be unjust to transfer to any one in particular all the merit of a discovery. There were, I believe, in this case

* Antheridia and antherozoids were discovered by Naegeli in 1844; the archegonia by Suminski in 1846, who also witnessed the entry of the spermatozoids into the archegonium. Bernhardi, according to a statement of Regel in the *Botanische Zeitung*, 1843, was the first to announce the production of hybrid Ferns. Regel's observations are noted by the Rev. M. J. Berkeley, in our number for July 27, 1844, where also the remarks of the late Mr. Henderson on the subject are given. Ed.

five who had formed more or less certain conclusions on this subject. I will therefore mention their names alphabetically—and fortunately this will bring to the front one to whom I am sure no true fernist will grudge any distinction; for no one has worked harder and with less assistance, and to no one are lovers of Ferns and mosses more indebted than to Mr. J. M. Barnes, of Milnthorpe, who by his discoveries in *Lastrea montana* has opened up an entirely new field of interest, though I do not mean to imply that this is the only claim which Mr. Barnes has on the gratitude of all who are interested in these matters.

Next in alphabetical order is Mr. E. J. Lowe, the well-known author of *Our Native Ferns*, and so distinguished in so many other branches of science that no further remark is needed here.

Next, Mr. J. E. Mapplebeck, of Hartfield House, near Birmingham, than whom a more observant careful and successful cultivator of British Ferns, or a more uniformly successful exhibitor of them, was never known.

Next, Mr. James Moly, one of the most original, indefatigable, and successful of discoverers, formerly of Hawkechurch, now of Charmouth, who with one or two others has done in the South with *Polystichum angulare* what Mr. Barnes and others have done with the *Lastreas* in the North.

Last, but not least, Mr. Stansfield, the elder, a botanist of no mean order and the original very enterprising head of the well known firm at Todmorden (now chiefly represented by his grandsons, Messrs. Stansfield of the Sale Nurseries, near Manchester).

To these five, I believe, is due the credit of having been the first to recognise the fact of the crossing of Ferns. There are, however, others who, though coming later into the field, have contributed so materially to its general recognition that this statement would be incomplete without alluding to them.

Of these the first entitled to be mentioned is the late Mr. A. Clapham, of Scarborough, so long known as one of the most observant, painstaking, and generous of the early discoverers and propagators of the varieties of British Ferns. Mr. Clapham was long known as the most successful of all hybridisers of plants in England, but through want of faith in this instance, he long held aloof from experiments with Ferns; but when at last (impressed by some of the results of Mr. Lowe's experiments) he did give attention to it, he approached it with all his old keenness of perception and judgment, and therefore his old success.

The writer of these notes is perhaps entitled to come next, and it is a pleasure to him to think that his experiments were not without influence on two others, who, in conjunction with him, have helped to produce an amount of evidence on this subject so overwhelming as to be absolutely convincing to all not predetermined to remain unconvinced. He refers to Mr. E. F. Fox, of Brislington, near Bristol, one of the most painstaking and successful cultivators and raisers of British Ferns; and the late Mr. W. C. Carbonell, of Rhiev Castel, Usk, who was not less distinguished in both these respects, and who has lately bequeathed the whole of his fine collection of British Ferns to Kew Gardens. *A. M. Jones,*

(To be continued.)

WEALD OF KENT AGRICULTURAL INSTITUTE.

AMONGST the very few first-rate establishments of its class in this country we may mention the newly-established college for teaching agriculture, rural economy, and "colonial handicrafts" at Hole Park, near Rolvenden, Kent. Mr. Richard Neve, the Director of the Institution, is an experienced land-agent, widely known in Kent, and his agency of such estates as Lord Cranbrook's at Hemsted Park and the late Mr. Beresford Hope's at Bedgebury, is, in many respects, advantageous to the students, opening to their observation many thousands of acres of really profitable and well-managed woods. Sir Joseph Hooker, Mr. Clutton, and other experts, recently assured a committee of the House of Commons that forestry in this country is sadly neglected, and that a School of Forestry is needed, the bailiffs of landowners being usually utterly ignorant of the subject. The exceptions to this rule are found in

Kent and some parts of Sussex, where we could point out woodlands that have brought the owners an annual return of £7 and £8 per acre per annum. The woodlands near Hole Park are admirably managed, and if timber becomes scarcer and dearer during the next thirty years, owing to the devastation of American forests by fire and cattle, forestry may prove to be what all the experts who gave their evidence to the committee, declared it will be—a strong resource for the future.

The College farm consists of about 1700 acres in Mr. Neve's own occupation. The area of grass and permanent pasture has been considerably increased of late, and the flocks of Kentish and other sheep numbered not less than 5000 at the time of our visit. The resident managers and proprietors at Hole Park are Mr. Herbert Neve, Fellow of the Surveyors' Institution, formerly of Cheltenham College, and for the past nine years an agriculturist engaged in farming and estate management in his native county of Kent; Mr. A. Curteis Neve, who gained a diploma with honours at the Royal Agricultural College, Cirencester, in 1833, and has since been an active manager of land; and Mr. Rich, a Fellow and examiner of the Surveyors' Institution, the gainer of three scholarships and the diploma of the Cirencester College, and of the only diploma with prize-money and life-membership awarded by the Royal Agricultural Society in 1874. He, too, is an agriculturist of wide experience, and we cannot doubt that with such a staff and such opportunities as those just noticed, the teaching of science with practice will be well blended here. H. E.

INDICATIONS OF SPRING.

The subjoined table, which has been forwarded to us by Sir Joseph Hooker, extends over periods varying from thirty to sixty years, and will be read with

INDICATIONS OF SPRING OBSERVED BY ROBERT MARSHAM, ESQ., F.R.S., AT STRATTON, IN NORFOLK, LAT. 52° 45'.

(Read before the Royal Society, April 2, 1789.)

Indications.	Earliest.	Latest.	Difference.	Medium.	Observed in.
Thrush sings	December 4, 1735	February 13, 1766	81 days.	January 14, 1747	56 years.
Snowdrop appears	" 24, 1778	" 10, 1795	43 ..	" 15, 1750	55 ..
Ring-doves coo	" 27, 1751	March 20, 1761	83 ..	" 22, 1750	47 ..
Turp flowers	January 10, 1786	June 18, 1790	129 ..	April 13, 1742	55 ..
Yellow butterfly appears	" 14, 1790	April 17, 1783	93 ..	March 3, 1773	26 ..
Rooks build	February 2, 1800	March 14, 1757	40 ..	February 21, 1744	53 ..
Hawthorn leaf	" 11, 1759	April 22, 1784	70 ..	March 19, 1758	59 ..
Frogs and Toads croak	" 20, 1750	May 4, 1771	73 ..	" 30, 1763	57 ..
Birch leaf	" 21, 1750	" 4, 1771	72 ..	" 20, 1745	52 ..
Sycamore leaf	" 22, 1750	" 4, 1771	71 ..	" 30, 1744	57 ..
Elm leaf	March 4, 1779	" 6, 1784	63 ..	April 6, 1773	47 ..
Mountain Ash leaf	" 5, 1779	" 2, 1771	57 ..	" 6, 1773	43 ..
Hornbeam leaf	" 7, 1794	" 7, 1771	61 ..	" 9, 1780	40 ..
Horse Chestnut leaf	" 10, 1763	" 2, 1771	52 ..	" 23, 1784	47 ..
Maple leaf	" 15, 1794	" 7, 1771	53 ..	" 12, 1788	34 ..
Wood Anemone blows	" 16, 1790	April 22, 1784	37 ..	" 5, 1788	30 ..
Lime leaf	" 19, 1794	May 7, 1756	49 ..	" 13, 1796	43 ..
Young rooks	" 26, 1747	April 24, 1766	29 ..	" 14, 1789	52 ..
Chestnut leaf	" 28, 1794	May 12, 1770	45 ..	" 21, 1776	36 ..
Swallows appear	" 30, 1730	April 26, 1797	27 ..	" 13, 1777	62 ..
Oak leaf	" 31, 1750	May 20, 1799	50 ..	April 20, 1757	54 ..
Ash leaf	April 2, 1779	" 26, 1772	54 ..	" 29, 1787	39 ..
Beech leaf	" 5, 1779	" 10, 1771	35 ..	" 23, 1785	53 ..
Nightingale sings	" 7, 1752	" 19, 1792	42 ..	" 28, 1781	59 ..
Cuckoo sings	" 9, 1752	" 7, 1787	29 ..	" 23, 1780	51 ..
Hawthorn flowers	" 13, 1750	June 2, 1799	59 ..	May 12, 1744	59 ..
Churn owl sings	" 20, 1781	" 26, 1792	58 ..	" 29, 1760	40 ..

N.B.—These observations were brought down to the year 1797 by the late Robert Marsham, Esq., who died anno 1797, etat 90.

interest, especially by those who contend that there has been a change of climate in this country of late years—a contention which is not borne out by carefully arranged statistics.

Mr. Marsham was evidently an observant naturalist, and several papers of his were published in the *Philosophical Transactions of the Royal Society*. It must be remembered that the Horticultural

Society was not then in existence. Thus we find that he published a paper on the usefulness of washing the trunks of trees, showing, by comparative observations and measurements, that the trunks of Beeches improved after having been washed and cleaned, and that there was an increased thickness of growth in such stems as compared with those that were unwashed. Other papers, published in 1759 and in 1793, give details concerning the growth of trees as measured at numerous definite intervals for a series of years.

The table here reprinted is evidently an abstract from the fuller ones given in the *Philosophical Transactions*, in which dates are recorded for each year in succession from 1735 to 1788. The abstractor has added a few observations made by some other observers subsequent to the death of Mr. Marsham.

It would be interesting to work out a comparison between the Marsham Records and those in the Cobham Journals edited for the Meteorological Society by Miss Ormerod; thus, for the Snowdrop, the earliest date given by Marsham in Norfolk is December 24 (in the year 1778), while in Surrey the earliest date given is January 10.

The latest day for the first appearance of the Snowdrop is noted in Norfolk as February 10 (1795), while in Surrey the date given is February 25.

The mean of 55 annual observations in Norfolk gives January 15 as the average date of the first appearance of the Snowdrop flower; while in Surrey the mean of twenty annual observations gives February 2 as the average date.

The difference between the earliest and latest date in Norfolk is given as 48 days, whilst in Surrey 46 days occur between the earliest and the latest record.

Similarly the Hawthorn (*Cratægus Oxyacantha*) is noted in Norfolk, from 59 annual observations, to

Unfortunately, in the present instance we have no corresponding tables of temperature, nor is there any indication that the same tree was observed throughout—an omission the more to be regretted as the individual variations of particular trees constitute a factor that cannot fairly be overlooked.

ALPINE RANUNCULUS.

ONE of the most characteristic genera of alpine plants is certainly the genus *Ranunculus*. It is divided into two great groups of species, those bearing white, and those bearing yellow flowers. The species with white and reddish-white flowers are much more numerous than those of the second category, which latter are only found in low and sub-alpine regions. All the species of *Ranunculus* which are found at higher altitudes, bear white flowers. I will begin by describing these because they are prettiest, most important, and also the most difficult to cultivate.

Rutaeculus rutaefolius, grows among the Alps and the Siberian mountains, both on calcareous and on granitic soils. Among the Alps it is rather rare, and is only found on the Grisons, Valais, and the Tyrol, at an elevation of 6174 to 8124 feet. It is found in abundance in the neighbourhood of Zermatt, and near the Hotel of the Schwarzee at the very base of the Matterhorn. The foliage of this species is much finer than the flower. It is glaucous in colour, and in shape reminds me of *Rue*, (*Ruta graveolens*); flowering season, June and July.

R. anemonoides, found in the Alps of South Tyrol and Styria, at an elevation of from 4875 to 7149 feet. It is one of the most beautiful species, when cultivated; the flowers are large, white inside, and outside of a bright rose-colour; the foliage much broader than is that of the preceding variety, which it somewhat resembles. It grows on calcareous soil, flowering in March and April. These two species, are easy to cultivate. The soil should be porous, though damp; well drained with pieces of limestone. The plant should be allowed exposure to the sun.

R. pyreneus.—Southern Alps and Pyrenees, at an elevation of from 5850 to 7800 feet. This species is very different to the two just described; the flower is of moderate size, the petals white, caducous, on an erect stem about 4 or 5 inches in height. There are sometimes five or six of these flowers on the same plant, presenting a very beautiful appearance. The leaves are narrow, linear, erect, of a glaucous green colour.

There are two varieties, one of *R. p.* var. *bulnearifolius*, the other *R. p.* var. *plantaginens*.

This plant is easily cultivated; it requires a damp soil, rich in vegetable mould, and exposure to the sun. It flowers when under cultivation in March and April.

R. amplexicaulis.—A very pretty Pyrenean plant, resembling the preceding species in shape, but much finer in all its parts. The flowers are silvery-white, bright and pretty. Cultivation is easy, the plant growing in dry soil, but requiring exposure to sun. It grows in the herbaceous border, flowering in April and May.

R. angustifolius.—Of the Pyrenees, seems to be only a variety of *R. amplexicaulis*, and is grown in the same way.

R. parnassifolius, is an essentially alpine plant, growing wild among rocks and between stones in sunny situations. It is found at an elevation of from 8124 to 10,074 feet. The flowers are pinkish-white, large, and borne on flexible creeping stems. The leaves are heart-shaped, resembling those of *Parnassia*. It is necessary in cultivation to supply a well-drained, stony soil, and the plants require a sunny situation. Flowering season, March and April.

R. glacialis.—A plant peculiar to the Alps, and met with at an altitude of from 7149 to 8124 feet, always on granite soil. It is one of the prettiest and most valued plants of our high Alps. When

have flowered earliest on April 13, 1750, latest on June 2, 1797, a difference of 50 days, the medium being May 12.

The corresponding entries in the Cobham Journals are earliest on the 120th day of 1834, and latest on the 142nd day of 1827. The mean date out of 14 observations being the 130th day from December 31.

growing it is generally in the truly alpine regions, and the traveller may be sure on seeing it, that he will henceforth be amongst the true flora of the higher Alps. The flower is large, white within, and copper-coloured exteriorly; in habit it is trailing and creeping over the ground. The foliage is very graceful, and suggestive of that of *Anemones* and *Callianthemums*.

I have found on the high summits of the Val d'Anniviers, in Valais, a variety with woolly foliage, covered with fine hairs.

The plant likes a cool situation, and a damp gravel or pebble soil, with an eastern or a western aspect. It flowers under cultivation in May and June.

R. Scguieri is a native of the Alps of Southern Tyrol and Venetia, at an elevation of from 6174 to 7473 feet. This plant differs from the preceding species as its flowers are smaller, and pure white, the leaves less cut and shorter. It grows only on calcareous soil, is cultivated in the same way as is *R. glacialis*, and flowers in June.

R. alpestris.—Found in the Alps, Jura, and Pyrenees, at a height of from 2598 to 6498 feet. This plant has a delicate flower, of a bright, silvery-white colour, and is one of the prettiest of the *Ranunculus*. In summer it is covered with blooms which almost hide the foliage. It likes a porous soil, rich in vegetable mould, and a northern or eastern aspect. It flowers under cultivation during April and May, sometimes blooming again in the autumn.

R. Traunfellneri.—Alps of Tyrol, at an elevation of from 3900 to 4875 feet. This seems to be only a variety of *R. alpestris*, from which it differs by its foliage being more sharply cut, its flowers being smaller, while the shape of the beak of its carpels is also different. It is cultivated as is *R. alpestris*.

R. crenatus grows in Tyrol, at an elevation of from 3573 to 6498 feet, on granite soil. Foliage rounded, faintly ribbed, crenulate, and not cut round the edges; flowers pure white, opening in May and June. Cultivation the same as for *R. alpestris*.

R. bilobus grows in Tyrol, at a height of from 4875 to 5850 feet, in calcareous soil. It is rare, flowers in May and June, and is cultivated as is *R. alpestris*.

R. platanifolius and *R. aconitifolius*, are species belonging to the mountainous zone of the Alps, and found on the mountains of Europe at an altitude of from 1950 to 6198 feet. They have white flowers, small, and borne on numerous small stems. Both these species like cool shade, and a soil rich in humus. They flower from May to July.

YELLOW-FLOWERED SPECIES.

The yellow-flowered *Ranunculus*, as I have already said, are found both on the lower and the higher Alps. An exception to this rule is, however, *R. pygmaeus*, a very small plant, found in the highest regions of Tyrol and Carinthia on granite soil, and which has also been found in the regions of arctic America. I have not yet succeeded in cultivating this plant in the alpine garden, so can say nothing concerning its proper treatment. I have sown some seeds of it, which I hope will come up.

Another *Ranunculus* with yellow flowers, which is also found in the high Alps, is

R. Pathora, which grows in Tyrol at an altitude of 6498 feet. It should be grown in porous, damp soil in a sunny situation. It flowers in May and June.

R. Thora, L., is found on the Jura and the Alps, on calcareous soil. It is a very strange plant; the leaf is single, well-developed, rounded, reniform, crenulate, springing from the centre of the stem; it seems to spread like a fan under the flowers. The flower is small, yellow, and terminal. The plant likes a porous soil and exposure to the sun. It flowers in May and June.

R. montanus.—Common on all European mountains. A low-growing plant, with large golden-yellow flowers. It likes a sunny situation and a light soil. It flowers from May to July, often re-flowering in the autumn.

R. Villarsii is found on the Southern Alps, but is rare. It flowers in May and June.

R. Breynei is found in Tyrol. The flower is golden-yellow, and opens from May to July.

R. Gouani, *R. carinthiacus*, and *R. lanuginosus* are remarkable neither for their interest nor for their beauty.

R. gramineus, L.—This plant, a native of the mountains of the South of Europe, grows in one or two places in Valais. It is a most curious and interesting plant. By its habit and foliage this variety resembles *R. pyrenaeus*, but its flower—of a bright yellow colour—places it in quite another category. The plant is remarkable for requiring a dry soil and a warm situation, with full exposure to the sun. It flowers in May and June.

All these different species of *Ranunculus* can be raised from seed. *H. Correvon*, *Directeur du Jardin Alpin d'Acclimatation, Genève*.

A STREAMLET AT CHARENTON.

THERE are few things that put to the test the asthetic feeling of a landscape gardener more crucially than his treatment of water. Too often we see a streamlet such as that shown in fig. 61 either treated as a canal or else the banks are broken up by meaningless curves and zigzags which offend the eye by their number and crudeness. In such a case as we are considering the water flows—it is in motion; moreover, that motion is gentle, and the banks are of soft yielding material, so that to attempt to give such a rugged, broken outline to the bank as would be proper were the soil rocky would obviously be absurd.

The water should just fret the edge into shallow irregular curves and indentations, suggestive of the gentle force of the current and the shallow depth of the water. The banks should not be too much encumbered by aquatic plants, handsome as they are. Judicious use should be made of them here and there, but their place is in clumps by the banks of a lake, rather than on the margins of a running stream.

Bulbous plants and low-growing perennials, Primroses and the like, afford a great charm in such situations. Trees adjacent to such a stream should be arranged in a direction somewhat parallel with the direction of the current, not at right angles with it, and an appearance of greater distance may be given by placing here and there a clump of trees nearer to the edge of the water than the rest.

The illustration at fig. 61 shows a streamlet at Charenton, and is taken from MM. Alphand & Ernoux's *L'Art des Jardins*, published by Rothschild, of Paris.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM CRISPUM.

M. ANDRÉ, alluding in the *Revue Horticole* of March 16, p. 133, to the habitat of this Orchid, says:—"After we had attained an elevation of 1623 feet above Pasca, a poor village of the Eastern Cordilleras, nearly 25 miles from Bogota, and at an elevation of about 6933 feet, the slopes became steeper and steeper, and the 'paramo,' or the cold upper region of the Andes, generally covered in fog, was visible beneath its veil of mist. The mules were confined to the care of a peon, and our ascent commenced. After two hours' walking through these 'lomas,' or mountainous prairies, covered with short grass, with here and there bushes of *Rubus bogotensis*, we entered the forest of Orchids. This was quite within the cold region. The arborescent vegetation was meagre and poor, covered with moss, lichens, and Hepaticas, which gave a green appearance to the branches in this region of perpetual damp. There were no flowers, with the exception of the beautiful clusters of white and pale rose of *Odontoglossum crispum* growing in the forks of the branches, of which plant I took a good supply. Certainly this

species is the queen of Orchids in the region of Pasca."

ANORCICUM MODESTUM, Hook. f., *Bot. Mag.*, t. 6693.

A small importation of this rare and beautiful Madagascar Orchid is now flowering in the *Angraecum*-house at Messrs. Hugh Low & Co.'s, at Clapton. In general appearance of its flowers it may be likened to *A. bilobum*, Lindl. The clear white flowers, which are borne on elegant sprays, are 1½ inch across, white, with a crystalline surface; spur 3 inches in length, white, tinged with cinnamon. The rachis and pedicels of most of the plants also are tinged with cinnamon. It is a charming species, and all the more acceptable on account of its odour of Tuberoses, which becomes very strong towards night. *J. O'B.*

CYPRIPEDIUM CAUDATUM, SEEGER'S VAR.

In the new Orchid nursery of Messrs. Seeger & Tropp, at Lordship Lane, S.E., perhaps the largest and darkest variety of this extraordinary Orchid ever seen is in flower. The large well-rounded pouch is purplish-chocolate on the outside, and white, beautifully dotted and marked with various shades of the same blackish hue on the inside. The very long petals are broad, and almost wholly reddish-brown; the sepals also very broad, yellow, veined with bright green. *Cypridium vernixium superbum*, C. *superciliare*, a large and peculiarly marked form of *C. Harrisianum*, and other rare *Cypridiums*, and other Orchids, are also now in bloom with Messrs. Seeger & Tropp. *J. O'B.*

SEEDLING DENDROBIUMS.

This genus lends itself readily to the skill of the hybridist, and we may look for still more interesting results from his labours than those already obtained. The number of hybrids of *Cypridiums* and *Sclenipediums* are now to be counted by scores, and amongst them are some of singular and quaint beauty; in all probability many scores more are in process of development, some of which will flower this spring and summer, and others will follow at later periods. As yet, however, the number of hybrid *Dendrobiums* is small, some five or six being all that have been considered worthy to receive distinctive names; I, however, look for many new forms to appear from time to time, and some of them, doubtless, will exceed in beauty any of the species with which we are at present acquainted.

I should much like to see the progeny of *D. nobile* crossed with *D. primum* *giganteum*, or *D. Dearei* and *D. bigibbum*; or, again, *D. Goldieanum* crossed with *D. Dearei*. Of these two latter crosses I have succeeded in getting seed-pods, and sowed the seed, but nothing came of it. It does, however, seem to me that if the pure white of *D. Dearei* could be so worked in with *D. bigibbum* that part of the flower would remain of a clear white, and the remaining portion of a deep rose colour, as the plant produces sprays with from four to eight flowers, lasting ten to twelve weeks in flower through the dull part of the year, we should secure a very beautiful and desirable object. I must confess to a feeling of considerable surprise and pleasure in seeing the figure in the *Gardeners' Chronicle* of March 17, of Messrs. J. Veitch & Sons' new hybrid *Phalaenopsis*. It is a fine production, betokening great forethought, patience, and cultural skill.

I have before me the result of others' labours in the form of some blooms of seedling *Dendrobiums*, kindly sent me by Mr. W. Holmes, Grangethorpe, Rusholme, Manchester. I and Mr. Holmes were neighbours for several years, and he was just as much interested in observing my stock of *D. Leechianum*, and watching its progress, as I was in a batch of seedlings that appeared at Cromwell Range when he was gardener to O. Schneider, Esq. When Mr. Holmes entered the service of the late C. Moseley, Esq., he had a good portion of the seedlings presented to him. These have come on most rapidly, and at the present time have strong, plump, pseudo-

bulbs, on one of which no less than fifteen flowers have appeared, the bulb measuring only 10 inches in length. Its parents were *D. Fendleyanum*—a grand variety—crossed with *D. aureum* (*heterocarpum*). The result is a progeny intermediate between the two, so far as form goes, whilst the substance, colour, and markings are more beautiful than those of either. The rich scent of *D. heterocarpum* is apparent in all, so that we have a hybrid satisfactory in every respect. The blooms sent represent four varieties, No. 1 being nearly 4 inches in diameter; sepals bright clear rose colour, darker towards the tips; petals white with bright rose coloured ends; lip full and open, the upper portion deep

growth, I anticipate that in a year or two we shall see pseudobulbs 2 feet or more in length, with from twenty to thirty flowers upon them. As is the case with so many hybrids, the growths of last year were much better than those of the previous season, whilst some of the leading pseudobulbs are now coming away with three new shoots from their base. *W. Swan, Preston.*

LOMARIAS.

LOMARIA GINNA is the best known and most useful species of the genus; although it is a little too dense in habit to be really effective for some purposes, it is

pleasing shade of green, and the plant has a very attractive appearance; but as a rule the vigorous growing varieties have rather a coarse appearance.

L. ciliata is a species which, although not so popular as the above, is, nevertheless, a very desirable Fern, and when well cultivated it forms a very pretty plant.

L. unda is a compact growing species, somewhat resembling a close growing form of *L. gibba*, and may be recommended, as it keeps in good condition in a low temperature better than most of the *Lomarias*.

L. discolor bipinnatifida—a very beautiful form—is rather scarce as yet on account of its rarely producing fertile fronds. It often produces what appear to be fertile fronds; but which, on examination, are found to be abortive. It has been cultivated at Messrs. Veitch & Son's nursery for a good many years, but it was not until lately that fertile fronds have been obtained. It remains to be seen if these will prove productive; and if a good batch of seedlings can be raised from them it is just possible that they will not maintain the true characteristic of the parent; but we may hope they may, and that this beautiful Fern may become more plentiful.

L. zamiaefolia is another distinct and useful species, and *L. Herminieri*, which I have previously alluded to as being remarkable for the brightly tinted young fronds, should be found in every collection.

TREATMENT.

Although all of the above varieties are classed with greenhouse Ferns, they succeed better in rather a higher temperature, especially during the winter months. The only objection to giving them a warm position is, that they are subject to the attacks of thrips, but if a moist atmosphere be maintained these troublesome insects may be kept in check. In growing-on seedlings, especially of *L. gibba*, the main point is to treat them liberally, and to prevent them from receiving a check in any way until they have attained a useful size, for as soon as they get a little stunted, they throw up fertile fronds as soon as given a fresh start, and although these are pretty in a young state, as the spores ripen the fronds turn to a brown colour, and give to the plants an impoverished appearance. *Pteris*.

FOREIGN CORRESPONDENCE.

BERLIN FLOWER MARKET.

The shops have quite a spring-like appearance with fine Dutch bulbs, Lily of the Valley, Roses, Azaleas, Camellias, Deutzias, and Spiraeas.

The Roses grown for forcing are chiefly root-grafted. On the occasion of my visit to the St. Petersburg International Horticultural Exhibition in 1881, the Roses observed there were worked about 8 to 10 inches from the ground, and presented a more artistic appearance, as well as finer flowers, and had a less compact crown than those which were root-grafted. *Appropos* of Roses, it may be mentioned that it is the opinion of the largest Rose forcer in St. Petersburg, and also of H. Drowich of Berlin, that Roses worked on 8 to 10-inch stems force more readily than others root-grafted. It is a fact, moreover, that owing to the great demand for the former, sufficient numbers are not to be found for forcing purposes at the present time. Indian Azaleas are grown mostly as small bushes from 10 to 20 inches in diameter; the larger Azaleas of a few years since are no longer to be met with. The old specimens have died, and now no one has the time, or will give himself the trouble to bring on others to take their places.

Pontic Azaleas (*A. mollis* and *A. pontica*) have appeared within the last few days. Why is it that these species force so badly? The few fine warm days recently have caused them to begin to grow in the open, so that the advantages of forcing the plants are very small. *Prunus triloba*, fl.-pl., as well-flowered standards, is to be observed in almost every

FIG. 61.—A STREAMLET AT CHARENTON. (SEE P. 428.)

orange with a patch of purple, and having a few lines of the same colour running into the yellow: this is surrounded with a zone of pure white, whilst the lower point is of a bright rose.

No. 2 is rather smaller, with clear white sepals and petals, with just a faint tinge of pink at the extremities; lip very similar to No. 1, with, however, more purple in the centre.

No. 3 is very similar to No. 2, excepting that the labellum is lengthened as in *D. heterocarpum*; deep yellow centre with no purple markings, very pretty.

No. 4 is the smallest of the number; sepals white, petals tipped with pink, lip clear yellow and white, with a nice patch of rose colour at the apex; the sepals are singularly reflexed, reminding one in some respects of *D. crassinode*.

As each of the hybrids is of very free and robust

one of the best Ferns for providing bright fresh greenery in groups arranged for effect, and as a commercial plant it finds considerable favour. There are several very distinct forms, and moreover the conditions under which the plants are grown will make a great difference in their appearance; but under treatment identical in its nature it will be found that the characteristics of the different varieties are fully maintained. The normal type as it was first sent out by Messrs. Veitch & Sons some twenty-five years ago, has not been much improved upon, but both the dwarfier and more compact growing varieties, and the more vigorous growing forms, are very useful for different purposes. Of the latter I saw a good variety at Messrs. Veitch & Son's nursery last year; it was named *L. gibba platyptera*, but the fronds in this variety are undulated, of a bright

florist's shop, and rarely as dwarf bushes—a most desirable form, but producing smaller flowers than the former. Rhododendrons well furnished with flower-buds are to be found, and more seldom *Erica persoluta*.

Enormous numbers of little bouquets composed of *Galanthus nivalis*—twenty to thirty blooms, bound up together in a bunch, in an utterly tasteful manner, find a very ready sale. Flowers of *Anemone fulgens* come from Northern Italy in large quantities, and are chiefly of the double-flowered varieties, in many colours. These are sold by the street flower-vendors in bunches as inartistic as those of the Snowdrop. Tasteful bouquets consisting of *Acacia dealbata*, Violets, Lily of the Valley—set off by the indispensable foliage of *Mahonia*—are more rarely observed. *Lencœum vernum* has not yet appeared, but will do so shortly. A well arranged wreath was noticed in a florist's recently, consisting of dark reddish-brown *Mahonia* leaves and a base of white Camellias, white Azaleas, *Helleborus niger*, and Lily of the Valley. The making of wreaths, has attained in Berlin, to a high degree of perfection, as was evident on the occasion of the death of the Emperor William. *Correspondent*.

EXHIBITION OF FORCING PLANTS, APPARATUS, &c., AT HAARLEM.

Among the many varieties of bulbous plants cultivated in Holland in recent years, so much attention as might have been desirable has not been paid to flowers suitable for very early forcing. The aim has always been to have large flowers of fine quality, and those are not always found to be the earliest. For many purposes, however, such early-flowering blooms are required, and there is now a tendency among growers to give them more attention than before. In January last a show of flowering Hyacinths and Tulips was held in Overveen, near Haarlem, which was a fair success; and at the general meeting on March 26 last of the Royal General Union for the Cultivation of Flower-roots, at Haarlem, it was decided to hold a show of flowering bulbous and tuberous-rooted plants on December 24, 25, and 26, 1888. The previous programme, which was discussed and enlarged, contains forty classes—for Hyacinths and Tulips in pots or glasses, for Crocuses, Narcissi, Amaryllis, Orchids, Anthuriums, Cyclamens, and for miscellaneous bulbs and tubers for the open ground as well as for glasshouses, and novelties. As this exhibition is principally undertaken for trade-purposes and for study, no medals or money prizes will be given, but Certificates of the first, second, and third class will be awarded. At this exhibition varieties fit for early forcing, and not sufficiently known at present, can be brought forward. It is to be hoped that cultivators of bulbs will do their best to make this show a fine one.

FLORISTS' FLOWERS.

SOME NEW GOLD-LACED POLYANTHUSES.

Among these should be placed Firefly, dark red ground, rich golden centre, pure well defined lacing, which cuts down to the "ground"—very pleasing and bright; Model (Barlow), red ground, deep golden centre, rather broad, and slightly paler lacing, good flat circular pip, and robust habit of growth. This fine variety expands badly, and requires a little assistance from the grower. John Bright (Barlow) will never be a leading exhibition variety, but it is a good grower and very fragrant, black ground, deep golden lacing and centre—very bright, wanting shape, but decidedly pleasant. Harbinger, like Cox's Prince Regent, and slightly clouded in the centre—the golden-laced edge not so broad as it is in the case of Prince Regent. Sunrise (Barlow), a beautiful red ground, bright and clear in colour, rich golden centre, lacing well defined—very bright, and good shape. When this can be distributed it will make an excellent exhibition variety. Criterion has a fine black ground, clear golden centre, very

neat and regular edging—bright and pleasing, and good habit of growth. Zoe (Bolton), rich black ground, fine clear golden centre, with regular lacing; very bright and effective, clearer in the ground than Cheshire Favourite. Whether any of these will be seen at the coming exhibition of the National Auricula Society in London I cannot say. At present it would seem that Polyanthuses will be late, for the cold wintry winds have a decidedly retarding effect. Those who can give them sufficient warmth to keep the temperature which surrounds them a little above freezing point at least, will find it very helpful. Those who have to grow in cold frames can scarcely do better than cover up at night while the freezing winds last. On March 19 my plants were frozen hard, and, indeed, they do not appear to have made any headway for a month past. And yet about the middle of January they appeared as if they would be unusually early in flowering; but then, who expected such wintry weeks in February, and such a tardy March? *R. D.*

AURICULAS.

In one of his pleasant chatty papers on the Auricula, the Rev. F. D. Horner has remarked that "The Auricula likes a half-yearly change, and although it will do in a clear North aspect the year round, the bloom will then be later, and with greater difficulty be protected from undesirable degrees of cold and dampness." This is very true. There is another trying influence of which Mr. Horner, away in his northern home, has little or no knowledge—and that is the London fogs. Damp and cold can be guarded against: but these terrible fogs defy remedy. They find their way through every crevice of the house or frame, and surround the plants. My neighbour, Mr. Roberts, at Gunnersbury Park, complains more and more of the effects of the London fogs in his plant and fruit forcing-houses, and they appear to be more destructive in January than in any month of the year. The purest of atmospheres appears to be required by the Auricula. There are a few sorts I cannot grow into size, do what I will. Among them is grey-edged George Lightbody. I have had some plants four years, and they are as small as when I first had them. They appear to make a free growth in spring and summer, and look promising in the autumn; but when the cold damp fogs of winter come, and with them a low temperature, the plants fall away to nothing, and make little or no headway in the direction of increasing size. I am sure I should succeed better could I give my plants a south aspect from October to the end of their blooming period, but having no accommodation I am obliged to keep the plants in a cold north house all the year round. Though they occupy an elevated stage, open below, and the plants near the glass, damp is ever with them, and it gathers upon the pots and the surface of the soil, and frequent washings of the one and stirrings of the other are necessary. At present I have scarcely a plant that is bare of trusses and the chances of having any in flower by April 24 looks very remote at present. The race is for those who can give their plants some fire-heat, and so help on their Auriculas into flower.

It is interesting to note how eager the plants appear to be to get forward into the blooming state. They have put forth a free healthy growth, but want the help of solar warmth to assist them on to the blooming stage. The pips expand but slowly in dull weather; the finer the quality of the bloom the longer time appears to be required to develop the pips into full character. At this stage fire-heat is an immense advantage, as with it the night temperature can be maintained as high as that by day, and even a little higher, whereas in a cold house, if there be some sun-heat by day, the temperature falls slowly by night, and then the plants "experience the undesirable degrees of cold and dampness," of which Mr. Horner speaks, and which are great hindrances to a fine and correct development.

April is generally regarded as the mid-season of the bloom of the Auricula. It is then that the grower can survey the results of his care and toil,

and reap the reward of his industry. Happy is he who in such a late and cheerless spring can so cultivate his Auriculas as that April brings the mid-season of bloom. I am wondering if I shall have a fully expanded pip by the 1st of May, either of Auricula or gold-laced Polyanthus. Anyone who takes an interest in the annual exhibition of the National Auricula Society likes to exhibit, if he can, but only once in the past five or six years have I been able to stage six Auriculas. I hope the time is not far distant when classes will be provided for plants grown wholly without fire-heat. Some amateur cultivators have advocated this for a few years past. They who, like myself, have to grow these plants in a low temperature, and leave them to the tenderness of Nature to bring their Auriculas on into bloom without help in the shape of artificial heat, feel that they can put in a reasonable claim for some consideration. They do this annually, in the hope that some day it will receive due attention at the hands of the committee of the National Auricula Society. *R. D.*

THE WEEPING LARCH.

[SEE SUPPLEMENTARY SHEET.]

We give this week an illustration of a Weeping Larch in the nursery of Mr. Maurice Young, Milford, whose knowledge of trees and keen insight into their nature and habits, have often been put under contribution by us for the benefit of our readers. It is a remarkable specimen, and grafts from it would reproduce the weeping tendency. Some of the seedlings might do so, others would not; and so arises that persistent "Why?" We rejoice when we find an answer, but when it is otherwise, as it is—oh, how often!—then the little word sometimes becomes objectionable. Why do the branches "weep"? "Gravity," "geotropism," and various other "isms," are invoked in answer; but, after all, they are mere expressions of facts, not explanations; and the why for the present remains unanswered, but only for the present we may be assured. In the meantime our appreciation of a strikingly effective tree, however much it might be increased by a knowledge of the why and because, is not lessened by its absence; and so we recommend all who have an eye for good things to visit Mr. Young's nursery and see, among the many subjects of interest there to be found, the Weeping Larch. If they are in a position to say because to our why, we shall be glad to hear from them.

PLANTS AND THEIR CULTURE.

HARD-WOODED ERICAS.—For these employ the best peat in the potting; a few small nodules of white sandstone: and much silver-sand may be added with advantage; these latter aerate the soil and keep it cool and moist enough without becoming waterlogged—conditions, favourable to the wellbeing of Ericas. Stake and tie out as advised for Aphelexis, but fewer stakes are required, indeed they look better if their branches are allowed to droop below the rim of the pots. Although most hard-wooded plants are benefited by a free circulation of air, yet draughts are injurious. After re-potting it will be advantageous to shade slightly for a fortnight during the warmest part of the day. Should mildew appear on the plants, dust with flowers of sulphur, and maintain a slightly warmer and drier atmosphere for a few days.

Clerodendrons, which are now starting into growth, may, if they require it, be turned out of their pots, slightly reducing the ball of roots, and repotting them, using a light rich soil, consisting mainly either of peat or loam, separate or mixed, and well enriched with decayed manure or some prepared fertiliser. In this genus we get both stove and greenhouse subjects—some, indeed, are hardy, such as *fetidum* and *trichotomum*, but perhaps the most popular and useful is *Thomsonæ*, variety *Balfouriana*, a native of Old Calabar, and therefore requiring stove treatment; it is a handsome subject for either pot culture or training up a rafter or pillar. By growing several specimens it may be had in flower the greater portion of the year. A good practice is to raise fresh plants annually,

employing cuttings of the young growths when about 6 inches long, which, if potted singly into thumbs and put into the propagating frame, will be well rooted in about a month, when they should be potted into 60's, and subsequently into 32's, using the soil before recommended, and standing the plants in a light position in a warm pit, syringing them daily. They should be stopped once and the shoots resulting should be about 6 feet long by the month of August, when they should be afforded more air, and less syringing, in order that the wood may be well ripened. These plants, after being rested, may be introduced into heat periodically during the following season, when, with the aid of manure-water a profuse crop of flowers will be obtained from plants in comparatively small pots. Training into the desired shape is best done when they are in flower. *C. speciosum* succeeds under the above treatment, and may be grown for variety. A handsome white-flowered climbing species is found in *C. nutans*, which, flowering as it does late in autumn, should be grown on that account. Of stove shrubby species, *C. fallax* is perhaps the best known; *C. squamatum* is similar to this, but is a rather stronger growing plant; both produce large panicles of scarlet flowers, and are easily propagated from seeds or cuttings. The best greenhouse species is *fragrans*, fl.-pl., but to have this plant in perfection it should be planted out in a similar manner to *Camellias*, when it will produce immense heads of its sweetly scented flowers for a long time in succession; treated thus, it is a handsome foliage plant, even when not in flower.

Miscellaneous.—Pot and prick off all seedling plants and cuttings as soon as they are fit to handle. Avoid bringing tender things into a cold or draughty potting-shed, and pay particular attention to damping and shading until the young plants are well established in their pots. In all cases, whether of stove or greenhouse plants, a genial growing atmosphere should be kept up while the plants are in this young stage. *Chrysanthemums* and *Salvias*, which are now established in small pots, should be potted on before they become pot-bound, using a strong loam, with a little soot and bone-dust added; a cool frame in a sunny position suits them admirably. Keep the plants well up to the glass, and if frost threaten cover with mats, or *Frigi Domo*. If freely aired on every favourable opportunity, there will not be much danger of mildew, or insects pests attacking them. *Iyacinths*, *Tulips*, and *Narcissus*, which are coming on too fast may be retarded by being placed behind a north wall. Fresh batches of hardy shrubs should still be brought on for indoor work. *Acer Negundo variegata* is a very effective subject for groupings with flowering plants, its long petiolate, white and green foliage harmonising well with other colours. *F. Ross, Pendell Court.*

THE FLOWER GARDEN.

BEDDING PLANTS.—*Pelargoniums* should have the points of all strong shoots pinched out, so as to maintain a dwarf sturdy habit. Overcrowding, resulting in spindling growth and the loss of bottom leaves, should be strictly avoided at this period; therefore, give more space where it can be afforded, and increase the ventilation in the day-time, preparatory to removing the stock to cold frames in a week, or ten days hence.

Begonias.—If tubers of these plants were started in boxes as advised, they should now be sufficiently advanced in growth to be divided and potted into small pots. Where it is desired to make the most of the stock in hand, each tuber, if of fairly good size, may be cut into three or four pieces, bearing in mind that, although they will grow very well if only one shoot is allotted to each, it is preferable to have two or three. Add to the compost in which they are potted, a small quantity of decayed manure, use clean pots well drained, and allow three or four days to elapse after potting, before watering.

Dahlias.—These may be treated similarly to the above, with the exception that each piece of the old tuber should be allowed to have only one young growth. Cuttings if put in now singly in thumb-pots and plunged in a bottom-heat of from 75° to 80°, will root quickly, and before becoming pot-bound, should be shifted into larger pots. Pot off young seedlings, and single varieties, transferring them to larger pots when large enough.

Seedlings of *Petunias* and other bedding subjects should be pricked out into shallow boxes or pans as

soon as large enough to handle, and be watered and shaded for a short time. *Asters*, *Ten-week Stocks*, and other seedling plants in frames should be closely attended to from this time onwards in regard to ventilation on bright sunny days, and watering them when necessary. Keep a sharp look-out amongst these subjects for slugs during the next two or three weeks, or considerable loss may occur. A second sowing of any of the above may be made if found necessary.

Propagation.—Continue till the end of the month the propagation of soft-wooded bedding plants. The first batch of early-rooted cuttings of *Alternantheras*, *Verbenas*, *Iresines*, *Ageratums*, *Mesembryanthemums*, and *Heliotropes* may have the tops cut off to form cuttings. These will be found to strike root more freely than cuttings from old plants. In the event of no more cuttings being required, move the boxes to a house having a lower temperature, and in a fortnight hence to the cold frames, *Alternantheras* and *Iresines* excepted. With increased solar heat more moisture will be required in the propagating house than hitherto. Fumigate with tobacco-paper to keep down aphid as occasion demands, and on alternate nights rather than by one strong fumigation. *J. Horsfield, Heytesbury.*

THE ORCHID HOUSES.

REPOTTING.—Hitherto much shading has not been needed, but it will be all the more necessary now, when bright days occur, and the blinds should be got in readiness, as the sun's rays will prove too much for the foliage of many Orchids. Now that the growing season has commenced many plants will require repotting, and the compost to be renewed. *Cattleya Gaskelliana* should be growing fast, and will need attention; specimens of *Laelia anceps* should be repotted and top-dressed as may be required; some plants that have outgrown their pots and have plenty of sound roots clinging round the outside suffer the least damage if the pot be set inside another one, at the same time breaking out the bottom of the inner pot, and also picking out all the old compost and filling the space with new crocks. *Laelia anceps* make roots the best when the peat and sphagnum are placed lightly about them, keeping the rhizomes of the plants well above it.

Deciduous Calanthes that have been lying on their sides in the East Indian house since the time their flowers were cut, are now starting to grow. I do not need to give advice on the potting of these *Calanthes*, for one of the largest bulbs here this last season was produced from a plant which had not been potted, but was grown again in the old compost. I think there is little doubt that the material about the roots of all Orchids would be greatly benefited and made almost sweet again if it could be thoroughly dried for a time without causing injury to the plants. These *Calanthes* will enjoy a place in the warmest house near the glass, and with very light shading, keeping the atmosphere of the house moist whilst there is abundance of sun-heat. *Masdevallia chimera* and similar forms that require it can be rebasketed, if boat-shaped baskets are used with narrow openings as a layer of sphagnum over the bottom instead of crocks will be best as this enables the flower-spikes to push out without hindrance. If these *Masdevallias* have been wintered in the *Cattleya*-house the cool house would suit them best at the present time, and they should be examined once in a fortnight, and some weak insecticide employed to rid them of red-spider and thrips. The flower-spikes of *Oncidium sarcoles* should not be allowed to remain on too long or the plants will become weakened and new growth fail to be made at the proper time. I saw a strong plant of this *Oncidium* the other day in the garden of A. Palmer, Esq., East Thorpe, Reading, bearing 167 flower-buds on one spike, also another spike coming away from near the top of a pseudobulb which struck me as being of an unusual size. *C. Woolford, Downside, Leatherhead.*

THE HARDY FRUIT GARDEN.

GRAFTING FRUIT TREES.—As vegetation is now fairly on the move, the grafting of fruit trees may be proceeded with, and if the trees have been headed back as previously advised, the operations connected therewith will be expedited. In grafting, it must be

borne in mind that success depends entirely on the perfect union of scion and stock, and it is therefore necessary that great care should be exercised in the performance of the work, especially in making the bark of both coincide at least on one side in the case of large branches, but it is better when it can be made to touch on both sides. Whip-grafting is the most convenient form for most purposes, and it is that which is generally adopted, except with old trees and large branches—cleft-grafting must then be resorted to, but it is a mode of grafting made but little use of out of the Cider Apple districts. Before commencing operations, pare the ends of the branches and the tops of the stocks perfectly smooth, and leave the surface slightly sloping towards the side on which it is proposed to work the graft. Choose as scions short-jointed well-ripened pieces, shoots with three or four buds on them, and in cutting them be careful to leave a bud near the base. With a keen knife cut the graft in a sloping direction, and make a slit or tongue about half way down the cut surface. Then remove a slice of bark and wood from the stock or branch of such a length and width that the graft will fit exactly, and make a corresponding slit on the surface to that on the graft, which must be held open with the point of the knife while inserting the tongue of the graft, and this being properly performed the graft is securely fastened to the stock. Then bind the graft round with matting—not too tightly—after which the point of union and some part of the scion above the tie should be clayed, or waxed over to exclude moisture. *A. Ward, Stoke Edith Gardens, Hereford.*

THE KITCHEN GARDEN.

GENERAL WORK.—Tomatos for outdoor culture should now be ready for potting into 6-inch pots, the soil to consist this time principally of good turfy loam; if this is of a heavy nature, a small quantity of leaf-mould and sand may be added to it. Each plant as soon as potted should be secured to a stick about 2 feet long, and may then be placed in a house with a temperature of 50° as a minimum, and where they will get sufficient light and air to keep them sturdy. Lettuces sown early in heat, should now be pricked out into cold frames at 4 inches apart, and kept rather close for a few days until growth begins. Peas sown early will now require to be staked, and if coal-ashes or similar materials, have been used to protect them from the depredations of slugs, carefully remove as much of it as possible, and with a rake draw a little soil up to the plants before putting the sticks into the ground. Cabbage and Lettuce intended to succeed those planted out in the autumn, should now be put out without further delay. Cauliflower plants protected in pits, &c., should be gradually hardened off in readiness for planting out about the middle of the present month.

Seeds to Sow.—The main crop of carrots should now be got in as soon as a favourable opportunity occurs, choosing the lightest soil of the garden, and in case of having to sow on soil of an opposite nature, endeavour to render it lighter by the addition of burnt earth and refuse sand, wood-ashes, &c. *Matchless Scarlet* is one of the best improved varieties to grow. More Peas should be sown according as the demand requires; and it is better to sow two or more varieties each time of sowing, a better succession being thereby maintained. The main crop of Celery should be got in as soon as possible if it is not already sown; Vegetable Marrows, ridge Cucumbers, and Gourds may be sown in pots for planting out on hot-beds afterwards, putting four seeds in a 5-inch pot to be reduced to the two strongest plants subsequently, and where heated pits are available some French Beans should be sown. *W. H. Divers, Kilton Hall, Stamford.*

CAMBRIDGE.—The estimates for the new plant-house (£2700) and research laboratory (£250) at the Botanical Gardens are accepted, Messrs. Boyd, of Paisley, being engaged for the former, Mr. TINDALL for the latter. Sir JOSEPH HOOKER, Mr. THURSELTON DAVEY, and several skilled horticulturists have inspected the plans, and they meet with general approval. The proposed Fern-house, stove, and Orchid-house have a combined area of 2600 square feet, as compared with 2200 square feet, the area of the corresponding present houses.

Advertisers are specially requested to note, that, under no circumstances whatever, can any particular position in the paper be guaranteed for advertisements occupying less space than an entire column.

SUBSCRIBERS TO

THE GARDENERS' CHRONICLE who experience any difficulty in obtaining their Copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

APPOINTMENTS FOR THE ENSUING WEEK.

MEETINGS.

MONDAY, APRIL 9—Ghent Chambre Syndicale.
TUESDAY, APRIL 10—Royal Horticultural Society; Scientific, Fruit, and Floral Committees.
THURSDAY, APRIL 12—Edinburgh Botanic Society.

SHOW.

SUNDAY, APRIL 15—Ghent Quinquennial opens.

SALES.

TUESDAY, APRIL 10—First Portion of the Broomfield Collection of Orchids, at Protheroe & Morris' Rooms.
Roses, Carnations, Picotees, &c., at The City Auction Rooms, by Protheroe & Morris.
WEDNESDAY, APRIL 11—Roses, Fruit Trees, Shrubs, Border Plants, and Bulbs, at Stevens' Rooms.
Collection of Orchids in Flower and Bud, and Imported Orchids from Messrs. H. Low & Co., at Stevens' Rooms.
Lilies, Roses, &c., at Protheroe & Morris' Rooms.
Nursery Stock, Stove and Greenhouse Plants from Sample, at Protheroe & Morris' Rooms.
THURSDAY, APRIL 12—Imported Orchids from Mr. F. Sander, 10,000 Liliun auratum from Japan, at Stevens' Rooms.
FRIDAY, APRIL 13—Imported Orchids, at Protheroe & Morris' Rooms.
SATURDAY, APRIL 14—Lilies, Roses, and other Plants, at Protheroe & Morris' Rooms.

The Local Government Bill.

The measure introduced to the House of Commons by the President of the Local Government Board, and which relates to the

Local Government of counties and districts within counties, can hardly be ignored by gardening publications. It is true there are many aspects of gardening, and some, whose interests are small, find little to concern them outside their little gardens, or greenhouses, or nurseries, for it is by no means uncommon to find people of considerable education and taste, and even Horticultural Societies, who ought to know better, taking a very restricted view of the general aspects of gardening. But the Local Government Bill, whilst in no appreciable degree affecting private gardening, and not very considerably the nursery or seed trade, may, and indeed does, largely concern all that portion of the trade which applies itself to the production of food in some form or other, as well as of flowers, for the benefit of the public at large. Since the introduction of the new Bill for improved local government we have had a very complex financial scheme, the Chancellor of the Exchequer's Budget, introduced also; and here again we find provisions which may somewhat largely affect the interests of the nurserymen and of the market garden community. Possibly the chief element of change

may be found in the incidence of local rates, for rates have long been a cause of considerable worry to the market grower, and to the nurseryman, and as local rates are in the new scheme to receive considerable relief, in some form or another, from the diversion of other forms of taxation to local purposes, it is evident that the market gardener may approach the subject of Local Government Reform with hopeful anticipation. This relief will be specially found in the promised payment of 4*l.* per head for the maintenance of indoor paupers, as in that way alone the poor-rate should show a reduction of one-third at least; that 4*l.* per head will come from ordinary taxes and licenses, although the charge will also have to be made up in certain directions, which may prove burdensome to the ground cultivator. The conversion of all the county areas eventually into district board areas will probably lead to the placing of the whole of the more populous rural districts under sanitary regulations similar to those which now prevail in local-board areas. In that case land used for all gardening purposes is exempt from the payment of three-fourths of the full sanitary rate, so that the change will not appreciably burden land. But the establishment of strong county and district boards having important powers may lead to the establishment of public markets for the disposal of produce, and should that be the case, it seems inevitable that growers must benefit as well as the public. New bodies freed from old traditions and entanglements may be able to promote markets in many directions which existing bodies cannot in earnest favour. The proposal to place all main roads under the charge of the county boards will lead to considerable additional expenditure both in material and management, but those who have horses and vehicles, especially those which are usually heavily loaded; can hardly fail to recognise the great saving from wear and tear to horses and vans which results from having high-class roads to travel over. The proposal of the Chancellor of the Exchequer, however, to place taxes first of 20*s.* on all heavy waggons—that is, to those over 10 cwt.—and also a wheel tax of 2*s.* 6*d.*, which will make an annual duty of 30*s.* upon all large waggons, the avowed object being to make those who use the main roads pay for their repair, is hardly likely to meet with cordial acceptance. It is true that the Chancellor specially exempts agricultural carts, but that exemption may refer solely to heavy vehicles employed about or on farms. The difficulty in the case of market gardeners is this, that whilst their vocation so far is agricultural, and may come under that term in relation to exemptions, yet around London and large towns no heavy traffic produces more wear and tear of the highways than does the market van traffic. Specially is it the case around London. Hundreds of heavily laden vans—the van and load often reaching 4 tons—having to traverse the main roads fully 14, 16, and even 18 miles some half-dozen times a week. If market vans escape this considerable tax of 30*s.* it will be hard to place it upon coal-waggons and numerous others, all of whom are legitimately engaged in conveying necessities of life to some portion or other of the community. Now market gardeners having narrow views of the necessities of existence, and who look no way beyond their own selfish interests, would doubtless prefer that the changes in local government and taxation indicated some considerable restriction of foreign imports of gardening produce. But there is a very big world outside of gardening which must live, and the Government does not yet exist which

will seek to restrict the supply of food to the masses. Hence the solution of market gardeners' difficulties in that direction may not be looked for. Others, again, very much more legitimately look—although, so far, with very little support—in the direction of reduced rents and the abolition of tithes, or their payment by the landowner. Well, relief in these directions may come some day, and relief to certain portions of the market-garden interest, in the practical equalisation of railway rates of transit for garden produce, seems appreciably near. That, however, may prove, even if granted, but an illusory or sentimental grievance removed after all. Changes of that kind are apt to act both ways, and do not always produce the benefits anticipated. With respect to the relief of local rates, on the one hand, through the diversion of considerable imperial taxation, there is to be set against it the possible new charges made under the Budget scheme, and which, if paid by market-gardeners, will be no light burthen. Taxes on locomotion of any sort are objectionable, and directly oppress, not only the public, but the trade of the community. We are not sanguine in assuming that new county authorities elected directly by the rate-payers will be any more economical than are existing authorities; and if they have considerable aid from taxes they may thereby be induced to spend freely—an almost inevitable result when income is not raised directly by rates. On the whole, the effect of the new Local Government and Budget schemes on the nursery and market gardening interest is problematical, and we should be unwise did we lead that interest to hope too much from their conversion into Acts of Parliament.

ROYAL HORTICULTURAL SOCIETY.—The meeting on Tuesday next, April 10, will be held in the Drill Hall, James Street, Westminster. The offices, reading-room, and library close by, at 111, Victoria Street, are approaching completion. By the way, it may be mentioned, that there are two houses of the same number in the street. The one in which horticulturists are interested is that to the west of the Army and Navy Stores, nearest to Victoria Station. At the general meeting, the new bye-laws will have to be confirmed or rejected. Up to the present time no one but the framers have had an opportunity of seeing them, which is unfortunate.

NARCISSUS COMMITTEE, ROYAL HORTICULTURAL SOCIETY.—Mr. C. R. SCRASE DICKENS, Honorary Secretary of the above, informs us that a meeting of the committee was held in the Drill Hall on Tuesday, March 27, when the list of garden and selected forms registered up to the present season was submitted. These number altogether thirty-one varieties if those of the white Ajax section now under trial at Kew are not excluded. A variety which was shown on April 13, 1886, and was then named provisionally "minor citrinus," was received again this year, and was found to be identical with pallidus præcox. The variety which has been widely distributed as "Ard Righ" was registered under that name; it is in the opinion of the committee identical with what has been shown as "Irish King," "Yellow King," and "Golden Dragon," on previous occasions. Mr. A. D. WEBSTER was elected a member of this committee.

THE GARDENERS' ORPHAN FUND.—Mr. W. WILDSMITH, the energetic Hon. Local Secretary for the Heckfield district, is showing a good lead, worthy of imitation by some of his brother gardeners. He has arranged for a lecture on "A Trip through the Great Desert to Mount Sinai and Petra," by a well-known lecturer, at which the local clergyman will preside: and the proceeds of the entertainment will be given to the Gardeners' Orphan Fund.

WEeping LARCH IN THE NURSERY OF MR MAURICE YOUNG, MILFORD

NATURAL HISTORY SOCIETY OF ABERDEEN.—

On Tuesday evening, March 27, Professor J. W. H. TRAIL delivered a very instructive lecture to the members of this Society, entitled, "With the Scottish Alpine Botanical Club in Norway." An account of this excursion will be found in our columns for September 3 last year, p. 274.

EMIGRANTS' INFORMATION OFFICE.—
